Four questions immediately came to mind These were 1 Had a break occurred in the sanitary precautions routinely and rigidly maintained by each military unit for the control of its water supply, food, excrement, flies and sewage disposal? 2 Did the men inadvertently expose themselves to a source of infection declared out of bounds or not recognized by local military authorities thereby permitting the ingestion of a massive dose of the causative organism? 3 Was the causative organism a species of Salmonella other than S typhosa, S paratyphi A or S paratyphi B and therefore not included in the accepted triple typhoid vaccine? 4 Were these proved cases evidence that the triple typhoid vaccine employed routinely for artificial active immunization affords less protection than is assumed? Each of these questions was investigated as far as possible Certain points were difficult to ascertain, however, because the infections were contracted on Okinawa, whereas the patients were hospitalized on Guam

It was learned that public health measures were enforced and that the men had been well indoctrinated as to the proper care of utensils, food, excreta and water Flies, however, were present in excessive numbers in combat areas where it was impossible to keep food and mess gear free from them As the natives had deposited their excreta and distributed it for fertilizer throughout the areas occupied by our troops, fecal contamination of food by flies undoubtedly occurred It seems probable, however, that the dosage of Salmonella deposited by flies on the food of any one person would be exceedingly small The likely source of infection became apparent when 12 of the 24 patients with proved infections readily admitted eating uncooked carrots, cabbage, onions, sweet potatoes, peanuts or sugar cane The sugar cane had been cut and was lying on the ground In each instance the patient gave a history of having obtained at least one or more of these products directly from Okinawan fields or gardens The vegetables were cleaned summarily and in many instances eaten in great quantity Except for eating these raw products, all denied emphatically the ingestion of water or food from any other than the military source of supply Furthermore, it is probable that raw vegetables were eaten by the patients who denied doing so As human excrement, "night soil," constitutes most of the fertilizer used on Okinawa, the immediate source of the infectious agent seems obvious It is suggested that the patients ingested a massive dose of organisms, thereby overwhelming their relative immunity

The organism recovered from each patient was identified biochemically and serologically as either S typhosa or S paratyphi A, thereby excluding the possibility of infection by a species of Salmonella not included in the triple typhoid vaccine

Statistical evidence shows unequivocally that triple typhoid vaccine as routinely administered is effective in the prophylaxis of typhoid or paratyphoid A It is a procedure that is practiced by all nations and rigidly enforced for Americans in military service The protection confirmed is obviously adequate under most conditions of exposure In the present series of cases, however, the ratio of the number of cases of paratyphoid A to typhoid was 8 to 1 This difference in incidence for the two forms of fever may be of significance but is difficult to evaluate Paratyphoid A in military personnel in the United States is rarely diagnosed, nor has it been reported from any of the islands occupied prior to the invasion of Okinawa It is therefore questionable whether the immunizing capacity of the S paratyphi A component of triple typhoid vaccine has been tested adequately for its ability to prevent infection in men exposed under field conditions Moreover, the immunity to infection induced by each of the three components is not only specific but also relative, it is therefore in balance subject to being overwhelmed by heavy exposure This status of relative immunity in military personnel who presumably are "protected" not infrequently is overlooked, with the result that typhoid or paratyphoid A, usually modified or atypical, is wrongly diagnosed or tardily considered Thus it is common in the first few days of the patient's illness for blood to be withdrawn for serologic studies More usually, this same blood sample is cultured Unfortunately, often only the single blood culture is taken, instead of interval blood cultures The foregoing remarks are pertinent to the present investigation

A negative Widal reaction during the first fortnight of illness does not rule out typhoid or paratyphoid A as a diagnostic possibility Specific agglutinins commonly are absent or in negligible titer during the first several weeks Thus in the present series of cases serum samples withdrawn from 9 patients with paratyphoid A during the first two weeks of illness were available for testing Only 5 of these showed a significant agglutinin titer against the causative organism In 3 cases the antibody response was minimal or absent For the third the only significant titer recorded was against a heterologous antigen In 2 additional cases significant antibody titers were not recorded, but the evidence is not conclusive since serum specimens were obtained only relatively late in the course of the disease

It was found that bacteriologic culture of the blood is the most important single diagnostic procedure when a case is seen within two weeks of the onset of illness Culture of the patient's blood at two day intervals for two weeks, or until positive, rarely fails in typhoid or paratyphoid A to reveal the causative agent Accordingly, extra effort early in the disease may establish the diagnosis and thereby modify therapeutic measures, institute isolation precautions and reduce to a minimum further laboratory work

In some cases of typhoid or paratyphoid A the Widal test is of great assistance in establishing the diagnosis, particularly if several specimens of serum taken at intervals during the course of the disease are available for testing A sharp rise in agglutinin titer against a single organism early in the disease is practically diagnostic A series of high agglutinin titer readings against one organism later in the course of the disease is significant if the titers against the other organisms are definitely lower

On the other hand, a negative Widal test cannot be depended on to rule out the possibility of typhoid or paratyphoid A In several of our proved cases of paratyphoid A significant agglutinin titers failed to develop against the causative organism In several other cases

in which agglutinins did appear comparable titers against heterologous antigens were observed The reason for the failure of specific agglutinins to develop is not clear The explanation for the appearance of agglutinins against heterologous organisms may result from the presence of common somatic antigens in the three species and in part to nonspecific anamnestic reactions since all subjects had been immunized previously with TAB vaccine

It is believed, therefore, that every effort should be made to establish the diagnosis of typhoid or paratyphoid A by the isolation of the specific organism from blood, urine or feces The Widal test is frequently of no aid in making or ruling out the diagnosis and in the case of the previously immunized subject from whom only one serum sample is available for testing the results may be frankly misleading Furthermore, it is difficult to compare results reported by two investigators unless standardized antigens have been used in both series

Cases of typhoid or paratyphoid A which were not specifically diagnosed undoubtedly occurred on Okinawa During the late spring and early summer of 1945 a number of patients were admitted to hospitals on that island because of fever of unknown origin The clinical picture in this group was one of sustained fever out of proportion to the patient's sense of comparative well being Little bacteriologic work could be carried out under existing conditions, and the serologic evidence was equivocal Several of the cases of typhoid or paratyphoid A reported in this series came originally from this group, and it is likely that some of the other cases of "Okinawa fever" were in reality typhoid or paratyphoid A During the preparation of the manuscript 4 additional cases of typhoid or paratyphoid A were detected on Guam, and the diagnosis was proved in 3 patients on Saipan [6] These men had recently returned from Okinawa It is possible that some of the men whose condition was not recognized will become chronic carriers of typhoid or paratyphoid A bacilli and as such will constitute a distinct public health menace, particularly on their return to areas where TAB immunization is not the rule for the general population

### SUMMARY

The occurrence of the clinical picture of typhoid or paratyphoid A in several patients recently evacuated from Okinawa with a diagnosis of fever of unknown origin stimulated studies that led to the detection of 3 cases of typhoid and 21 cases of paratyphoid A in military personnel previously immunized with standard TAB vaccine The clinical findings closely resemble those characterizing the disease in unvaccinated subjects The case fatality rate was nil, although 5 patients developed complications Repeated blood cultures proved to be the most valuble diagnostic procedure, serologic findings were often noncontributory Infection appeared to have been acquired through the eating of raw vegetables in combat areas on Okinawa, where the use of human night soil as fertilizer is widely practiced

6 Capt J D Rosenbaum M C A U S, 39th General Hospital, brought to our attention 3 cases of paratyphoid A in soldiers evacuated from Okinawa to Saipan for hospitalization He supplied a summary of the clinical and laboratory data on which he established the diagnosis for each case Two of these cases add interest to the present study 1 case by way of adding emphasis to the need for repeated blood cultures early in the disease for he recovered the organism from only one of nine blood cultures taken in the first seven days following admission the other case in that an afebrile period of nineteen days with apparent convalescence after forty four days of fever was succeeded by a relapse as evidenced by clinical illness and fever for ten more days

## THE STATUS OF THE GENERAL PRACTITIONER, PRESENT AND FUTURE

S A THOMPSON M D
and
S B THOMPSON, M D
Camden, Ark.

In the addresses before medical meetings and in the papers in the medical literature today one sees more and more concern over the shortage of specialists certified by the various specialty boards Many of these utterances imply that this shortage indicates an inadequacy of medical care now available Our purpose in this presentation is to point out a trend toward the concept that only specialists are qualified to treat patients, to question the validity of this concept and to present a plan to halt or reverse this trend It is not our purpose to question the importance of highly trained specialists in the treatment of patients simply to question the necessity of their treating all patients

For convenience of discussion the system of the practice of medicine in which the patient has no choice of physician in which supervision of the physician in charge of a patient is exercised authoritatively and in which remuneration for services is not accomplished between the physician and patient directly, will be referred to as regimented medicine This system includes the medical service of the military services, the Veterans Administration, medical teaching centers, certain industrial medical plans and other similar systems The opposed system wherein a patient selects and remunerates his physician and where the physician is free from authoritative supervision will be termed the private practice of medicine The relative merits of these two systems will not be discussed

### THE TREND

Those who served in the army hospital system are familiar with the operation of the Consultants Division of the Surgeon General's Office Medical officers were classified as to specialty training and as to relative competence within the specialty On the basis of a number so derived, assignments of individual officers were made For example, the number 3153 indicated that the officer was a medical officer qualified as an orthopedic surgeon The letters A, B, C and D were used to denote relative competence D rating indicated minimal training and experience in the specialty and was used, for example, to denote an officer who had had only an internship prior to military service and had been given a brief army course in his specialty Thus, an officer rated as 3153 D would likely serve on an orthopedic staff under supervision of a higher rated officer A C rating indicated training incomplete but with sufficient background and experience to function as a specialist without supervision if necessary Men taken into service directly from residences, men with experience in a specialty but without formal training, were usually given this rating Thus 3153 C would lead to assignment as assistant to an orthopedist in a large hospital unit or chief of orthopedics in a smaller unit In actual practice many C rated men served as chiefs in the larger hospitals, owing to the scarcity of men with higher ratings B rating indicated certification by a specialty board or equivalent training and experience Thus 3153 B men were the ones the Army desired to use as orthopedic chiefs in their general and larger station and evacuation hospitals The A rating was reserved for men of professional rank and served

primarily as consultants and as chiefs in the specialty centers The introduction of this system resulted in improvement in medical care and in medical personnel assignment It brought about the conversion of indifferent, politics ridden hospitals into miniature teaching centers and it resulted in young medical officers setting their goal at certification in order to obtain the coveted higher rating Where did the general practitioner fit into such a system? In the hospital system, if he wished to treat patients, he had to serve as a "junior specialist" in a capacity similar to that of the D rated specialist Promotion in military rank depended on the position occupied, and position in the professional field depended on specialty rating, not at all uncommon was the sight of a 30 year old chief with 40 year old assistants Is it surprising that so many chose administrative, sanitary and field duties where promotion was not dependent on specialty training? Certainly physicians subjected to this system will emerge from the service feeling that there is a very high premium on specialty training What of the patient—the 11,000,000 soldiers? His unit surgeon, the Army's nearest approach to a family physician, was rarely allowed to treat him in quarters, had minimal equipment in his dispensary and relinquished contact, in most instances, when the patient was hospitalized For many complaints of relatively simple character the soldier was referred to the hospital specialty outpatient clinics and, when hospitalized, his case was controlled completely by men who were considered specialists If he had complaints in two different body systems, almost invariably he saw two doctors Is it unreasonable to expect that he may emerge with the impression that only specialists are capable of treating him?

With the war over and soldiers converted to veterans, this may pass Will it? The veterans' hospitals operate in a very similar manner, and the newly created consultants system of the Veterans Administration is almost identical with that of the Army In THE JOURNAL of February 16 General Hawley[1] indicates the concern of the Veterans Administration over securing specialists by pointing out that the law provides a 25 per cent increase in base pay and original appointment at a higher grade for men certified by specialty boards Further, he states that "physicians in the service of the [Veterans Administration] will be encouraged to train for certification in the specialty of their choice." Will not the eventual culmination of this policy be certification of all physicians serving the Veterans Administration? Here, again, all patients admitted to the hospital will be treated by specialists General Hawley[1] states that 19,000,000 men will fall under the care of the Veterans Administration The families of these are likely to think as they do If veterans have an average of three dependents, it is conceivable that 76,000,000 members of the American population may be indoctrinated with the concept that only specialists are capable of treating patients

The Veterans Administration program of making agreements with the state medical societies for care of service connected disabilities of veterans by physicians and hospitals of the veteran's home community does allow some participation in their care by general practitioners For example, the agreement with the Kansas society provides that a veteran claiming service connected disability will be sent to a physician of his home community for complete physical examination This examiner then recommends that the veteran be further examined by a specialist in whose field the alleged disability falls, if indicated The disability rating board then acts on the combined reports That this may be an act of expediency resulting from the overcrowding of the Veterans Administration hospitals rather than a Veterans Administration policy to permit participation by the general practitioner is indicated by the fact that this system is to be used only when the Veterans Administration hospitals are filled In THE JOURNAL, Oct 6, 1945 Dr DeBakey[2] recommended that treatment under this system be given by staff physicians selected on the basis of certification by the various specialty boards Although Dr DeBakey's opinion is strictly his own, it is probably in accord with that of most other members of the Consultants Division of the Army, and the liaison between the Army and the Veterans Administration consultants is very close From this one may reach the conclusion that even in the local care the trend of the Veterans Administration will be toward the concept of total specialization

The Pepper bill now before Congress would perpetuate the maternal and infant care of the Emergency Maternity and Infant Care Program for all families A committee from the advisory board to the Children's Bureau recommended that only certified specialists be allowed to participate in this program The advisory board did not accept the committee's report, but it is indicative of the trend of thinking now in progress

In the medical teaching centers where our students, interns and residents are trained and where so many of our low income group receive their medical care, a similar trend is apparent The organizational structure of most of them is familiar to all who have passed through them Each patient is seen in a specialty clinic or admitted to a specialty service All cases, including the most trivial and routine cases handled daily by the general practitioner in private practice, are treated by specialists or under the supervision of specialists The teacher of medicine who uses his contempt for the general practitioner as a substitute for humor is present, unfortunately, in many such centers Since the teachers of medicine are specialists, it is only natural that they should glorify the role of the specialist even where such feelings are not expressed Dr DeBakey,[2] in his previously quoted article, says with genuine concern that "there are in the United States today some 160,000 practicing physicians, of whom only slightly more than 20,000 are certified by the various specialty boards as qualified in their chosen fields" Is a ratio of one specialist to eight general practitioners low? Undoubtedly it is if all patients must be treated by specialists, as the present policies of the armed services, the Veterans Administration and the medical teaching centers imply they should be

What of private practice? More and more common is the patient who feels that his differential diagnostic acumen is such that he can select the proper specialist without benefit of advice from his family doctor, and it seems reasonable to anticipate that this group will become more numerous as the previously mentioned indoctrination progresses More and more prominence is being assumed in private practice by the group clinics, and the trend in these appears to be steadily toward specialization If one will glance through the classified advertisements in THE JOURNAL, "wanted, specialist in to join group, must be certified" will be found

1 Hawley P R New Opportunities for Physicians in the Veterans Administration J A M A 130 403 (Feb 16) 1946

2 DeBakey M E Our National Medical Resources J A M A 129 417 (Oct 6) 1945

to be the approximate wording of a great many Does not the absence of general practitioners from many of these groups imply to the patient that complete care does not include the general practitioner?

The one purpose of the foregoing material is to show that a trend is under way toward a concept that only specialists are competent to treat patients If this doctrine is accepted, the concern exhibited by Dr DeBakey [2] and felt by many others over a one to eight ratio of specialists to general practitioners, the preoccupation of the Veterans Administration and other regimented systems over the shortage of qualified specialists and the feverish activity of the various specialty organizations to provide additional residencies are understandable If the profession accepts it, steps must be taken to allow the physicians of private practice to acquire the required training just as General Hawley [1] has promised the men of the Veterans Administration Can the medical schools conscientiously send out a man with only an M D degree if they feel that he is not qualified to treat patients until he becomes certified by a specialty board?

## VALIDITY OF THE CONCEPT

Suppose the profession does not accept this concept Is the position that many patients may be treated adequately by general practitioners tenable? Dr B A Hopkins [3] in the chairman's address before the Section on General Practice of the Southern Medical Association quotes Dr Pressley as saying "It is the definite conviction of some of the outstanding leaders of the medical world that from 80 to 85 per cent of those seeking medical care could be skilfully and successfully cared for by a well trained general practitioner" After reviewing over 2,000 consecutive individual cases, Dr Hopkins found this estimate conservative A similar impression is echoed by medical leaders at every meeting where discussion of this topic arises

The basic policy of the private practice of medicine, even today, rests on the general practitioner who takes care of the routine ills of all members of the family and refers them to appropriate specialists when occasion demands Is this an outmoded system? Has it failed? Is it necessary to have a pediatrician prescribe for the children and an internist for the parents when the same upper respiratory infection strikes several members of a family? Must the orthopedist be called for the contusion, sprained ankle and undisplaced fracture? These examples are not absurd, this sort of thing occurs daily in the previously described regimented systems This may be more controversial, but does adequate care require the presence of a certified obstetrician at a normal delivery? A man who has spent the time and money required to become certified can reasonably expect a larger fee for this work, but is it necessary for patients to pay such fees for routine care?

Two basic criticisms have been leveled at the system of general practice First, failure of the general practitioner, on occasion, to differentiate between the trivial and the serious For example, the sprained wrist which the general practitioner may bandage and give reassurance about may be found to be a fractured carpal navicular when seen by the orthopedist Failure to immobilize may result in a preventable permanent disability The fractured lateral malleolus requiring simple immobilization may also present a tibiofibular diastasis requiring more involved treatment Specialists in other fields can cite equally telling examples within their experience In other words, the general practitioner sometimes fails in his very important function of referring patients to specialists at the proper time. The answer to this criticism is for the general practitioner to become more proficient in differential diagnosis This will be amplified later

Secondly, the failure of the general practitioner to observe the limitations of his training is a very serious criticism That some general practitioners fail to refer patients requiring specialized care may be attributed to their fear of loss of prestige and income, of the two, prestige is probably far more important The indoctrination of the public and the young physician with the idea that the specialist is a vastly superior being is, to a large extent, responsible for the fear of loss of prestige and leads many general practitioners to try to create the illusion, both to themselves and to the public, that they are, more or less, specialists The answer to this lies in the improvement of the status of the general practioner and his indoctrination with regard to the dignity of his position as a family physician

The abuses leading to these criticisms, while serious, are susceptible of being corrected Too, the criticism is directed at certain individual general practitioners and not at the system of general practice

What is the case for the general practitioner? The economic waste involved in specialty care for routine conditions has already been mentioned, but, more positively, what has the general practitioner accomplished? During the past fifty years the life expectancy has been increased from 33 to 60 years, maternal and infant mortality has been lowered tremendously, many infectious diseases have been all but eliminated, and numerous other great strides have been made Using Dr DeBakey's statistics,[2] seven eighths of the physicians today are general practitioners Of the one eighth who are specialists, many are quite young and many are engaged in full or part time research One may safely conclude that well over 90 per cent of medical care to patients has been given by general practitioners during this forty year period Has the general practitioner not been successful in bringing the advances of medical science to the patient? Surely this implies that he is capable of treating patients

How does the population fare in the system when he is eliminated? The lowest income group of a large city receive their medical care, for the most part, from teaching hospitals, where all patients are treated by or under the supervision of specialists The finest of equipment and professional skill are available In towns of 10,000 or less, patients are treated by general practitioners with quite limited facilities and are referred to private specialists or medical centers, depending on financial status, if their needs warrant. One needs only to observe the difference in appearance of these two groups to see which has the higher health standards True the social conditions in small towns are more conducive to health than are those in a city's slums, but may not this be a reflection, to some extent, of the success of the two systems of the practice of medicine? Can the businesslike chief resident, or even the suave professor, hope to compete with the well known and beloved family physician in persuading a family to modernize its toilets, cover its garbage can or inoculate its children? Which, likely, would be more successful in persuading the head of the house that it really is necessary for him to give up tobacco now that he has Buerger's disease, or that his wife must have extensive and dangerous surgery in the hope of eliminating carci-

3 Hopkins B A The General Practitioner and Rural Medical Care, South M J 39 106 (Feb) 1946

noma, or that his young daughter must have rest, sunshine and milk until her chest films clear? The specialist can expect far better results if he can count on the influence and moral support of the family physician in seeing that his specialized regimen is followed as he recommended

There is reason to believe that, in many instances, a patient may receive better care by routinely consulting his general practitioner before seeking the attention of a specialist No past or personal history, however skillfully taken, can approach in comprehensiveness the knowledge possessed by the doctor who delivered the patient, treated him for measles and whooping cough, gave him his inoculations, stood by while the otolaryngologist removed his tonsils or the orthopedist reduced his football fracture, advised him prior to marriage, nursed him through his period of mental depression and watched the gradual rising of his blood pressure By having cared for his parents, siblings, wife and children the family doctor may know more of his family problems than the patient himself With such background of information is it not possible that his opinion on some obscure complaint may be far more valuable than that of the most highly trained specialist? The importance of seeing the patient as an integrated personality in his natural environment has been strongly emphasized by the writers on psychosomatic medicine Can any specialist approach the family physician in his opportunity to do this?

What specialist can overcome the natural bias toward those things with which he deals? If the patient complains of low back pain, will not the orthopedist first check the posture, the urologist the prostate, the gynecologist the position of the uterus, the gastroenterologist the bowel habits? How many specialists must the patient consult before the source of his complaint is found? Many fruitless diagnostic procedures could be avoided and money, suffering and time saved if patients consulted the general practitioner and the appropriate specialist recommended by him

What of the value of personalized attention? The sick person is more than bed number 14, diagnosis duodenal ulcer He is Mr John Doe, who has, among other things, indigestion The services of the radiologist and clinical pathologist are most welcome in establishing the diagnosis, of the internist in outlining the management and of the surgeon in handling his complications duly appreciated The adherence to the regimen outlined and the eventual outcome, however, are far more dependent on the family physician who cajoles, threatens or placates as the occasion demands than on any or all of these. The returned service man has no specific complaint in regard to his medical care in the service, on questioning, he will admit, reluctantly, that he received the necessary care, but, somehow he was not satisfied Frequently it is worded "They didn't pay any attention to me" He knows this is not literally true, but the personal touch was missing and on this occasionally rests the difference between recovery and invalidism It appears inevitable that a system that does not include the general practitioner must give up much of the traditional doctor-patient relationship Can medicine afford to discard such a useful weapon from its armamentarium?

### PROPOSALS TO CHECK THE TREND

If the trend not just to increased specialization but to a philosophy that only certified specialists are competent to treat patients is accepted as existing and if it is believed that this concept is not valid, the medical profession is faced with an obligation to halt this trend What can be done to retain and improve the present status of the general practitioner?

Since the trend is so much more pronounced in regimented medicine, it is felt that recognition of the general practitioner by the regimented systems would do much to improve his status in the minds of patients and young physicians To implement this it is proposed that general practitioners be given staff appointments in teaching centers A competent and successful general practitioner assigned to each specialty service would act as an adviser to the chief of service in regard to those parts of his specialty which should be emphasized in the training of general practitioners It is believed that this would eliminate the situation where, for example, a future general practitioner completes the orthopedic service of his internship knowing well how to serve as assistant at a spinal fusion, which is of little value to him, but knowing little about the differentiation between sprain and internal derangement of the knee joint, the differentiation of which may save some future patient of his a permanent disability This system might go far toward eliminating the first of the two serious criticisms of the general practitioner previously discussed Secondly, it would enhance the prestige of the general practitioner in the mind of the young physician

A second proposal to implement recognition by the regimented services is to establish general practice services in teaching, military and veterans' hospitals These services could handle the routine, not necessarily minor, conditions usually handled in that community by general practitioners in a manner similar to that used in private practice This would provide an excellent spot for training future general practitioners, would relieve the specialty services of the routine so that their energy might be devoted to cases requiring such highly trained skill and would enhance the prestige of the general practitioner in the mind of both patient and young physician It would offer an excellent opportunity to inculcate in the young general practitioner the necessity of calling for specialty consultation when indicated and might do much to alleviate the abuses of both the major criticisms of general practitioners previously discussed In the military service, particularly in garrison, an opportunity for the unit surgeon to treat his own men in the hospital for routine conditions could be provided on such a service and might go far to make the assignment as unit surgeon a popular one rather than the undesirable assignment it so frequently is at present Since the apparent goal of the Veterans Administration is to make its hospitals as much like teaching centers as possible, the proposals for teaching centers would likewise apply to them The navy in its ship assignments offers some opportunity for general practitioners, but it is subject to the same proposals as the army for its shore installations

The agreements being made between the Veterans Administration and various state medical societies for care of service connected disabilities by local physicians in local hospitals is the only ray of hope for an improved status of the general practitioners now evident on the horizon of regimented medicine In that it provides for general physical examinations and general medical care by general practitioners with reference to specialists when indicated, it may represent the beginning of a trend toward recognition of the value of the services of general practitioners by regimented medicine It has been implied previously that this

may be an act of expediency rather than policy, but, whatever the reason for it it gives the general practitioner an opportunity to demonstrate the value of his service to regimented medicine It is urged that the general practitioners of the nation accept this opportunity as a real challenge The big flaw in the agreement, from the standpoint of elevating the status of the general practitioner, is that the veteran can receive care in this manner only if the Veterans Administration hospitals are filled It is proposed that, even when Veterans Administration hospital space is available, the veterans be given the choice of accepting his care in this manner or of going to a Veterans Administration hospital This would make available to the Veterans Administration that previously discussed fund of knowledge possessed by the family physician and would provide the personalized medicine the veteran misses so sorely in military and Veterans Administration hospitals For the general practitioner it would do much to enhance his prestige in the minds of the 19,000,000 veterans and their families It hardly need be added that for cases requiring prolonged hospitalization and highly specialized care the veterans' hospital centers designed for this purpose are admirable and desirable

In addition to and in order to obtain, the recognition of regimented medicine the causes for criticism of the general practitioner must be eliminated or minimized To do this it is proposed that the training of the general practitioner be standardized and improved In the past, the general practitioner has taken the same type of internship as the embryonic specialist. The rotating service consists in one to two months on each specialty service The disadvantages of this system and proposals for correction have already been presented The second year internship, the mixed residency and short residencies in various specialties frequently send a man into general practice with a rather confused idea of what the capabilities and limitations are Because one was allowed to do a few appendectomies in a one year internship, occasionally one honestly feels that one is competent to open an abdomen without supervision The general practice service in teaching hospitals might do much to clarify in the minds of young physicians the limits within which they can safely practice Training does not cease with entry into practice, and the proper training of the general practitioner must continue as does that of the specialist The addition of sections on general practice in the American Medical Association and other organizations is a significant forward step It is proposed, however, to bring the program closer to home Would one be justified in considering it the solemn duty of the specialist to keep the general practitioners of his community informed on those phases of his specialty which apply to general practice? Might not the specialist be considered partially responsible if a general practitioner who habitually refers patients to him makes an error in his field? It is urged that specialists accept this challenge as their contribution to the improvement of the status of the general practitioner

To eliminate or minimize the criticism that many general practitioners attempt to encroach on the field of the specialist to the detriment of the patient, the general practitioner must set his own house in order It is believed that the foregoing measures to improve the status of the general practitioner will give him sufficient pride in his field that the temptation to encroach on the specialties will be lessened An honest confusion as to what his limitations are can be corrected by improved training methods Fundamentally, however, this is an individual problem in ethics and must be worked out by individual general practitioners with the guidance of the medical organizations

As a method of improving the educational standards, as a means to bring about the limitation of the work of the general practitioner to that for which he is adequately trained and as an agency through which educational material directed at the profession and the public might be disseminated, an organization limited to general practitioners and with standards sufficiently high to make membership a significant honor might be considered That there is a need for the general practitioner to put his house in order is implied in the criticisms already discussed and in the fact that the prestige of the family physician is on the decline, as indicated by the trend toward his elimination Individual action, group action in local medical societies and free discussions at medical gatherings can do much to eliminate the abuses now prevalent Most specialties, however, have found it advisable to organize and set up standards in order to dignify their group, and such organization may be the answer for the general practitioner

## CONCLUSIONS

1 The outlook for the general practitioner of tomorrow is not encouraging in the regimented practice of medicine Some hope in this field is seen in the agreements between the Veterans Administration and the state medical societies Proposals for recognizing the general practitioner by regimented medicine are not expected to make the regimented services particularly enticing to the general practitioner but could do much indirectly to improve his status in private practice

2 The opportunity now available in the local care program of the Veterans Administration is a real challenge to the general practitioner to prove his value to regimented medicine

3 The outlook in private practice for the general practitioner remains good and it is felt that the proposals presented can do much to improve his status in this field

4 The status of the general practitioners of tomorrow depends on concerted action by the general practitioners of today

## SUMMARY

A trend toward the concept that only specialists are competent to care for patients may be checked by adoption of the following plan

I Recognition of the general practitioner by regimented medicine through
  A Staff appointments for general practitioners in teaching centers
  B General practice services in teaching, military and Veterans Administration hospitals
  C Perpetuation of the Veterans Administration's system for care of the veteran in his local community with general practitioners participating
II Elimination of causes for criticism of the general practitioner through
  A Standardization and improvement of training of general practitioners
  B Limitation of the work of the general practitioner to that for which he is adequately trained
III Organization of general practitioners to implement these proposals

## ACCIDENTAL INGESTION OF DDT, WITH A NOTE ON ITS METABOLISM IN MAN

M I SMITH M D
Bethesda Md

R. A a man aged 46, a farm hand, weighing 140 pounds (63 5 Kg ) in the employ of Dr Paul Bartsch of the United States National Museum, was given a 5 per cent solution of commercial DDT [1] in kerosene for use as an insecticide spray Some of this solution in a bottle was carried in a pocket containing a supply of chewing tobacco The cork came loose and an undetermined amount, estimated at about 1 or 2 tablespoons was spilled on the tobacco A plug of the tobacco was chewed on that day, July 2, and in about two hours, by his own account, he became nauseated and apprehensive and experienced a sensation of tightness, stiffness and pain of the jaws and soreness of the throat He was apparently not aware of the odor or taste of kerosene The nausea and

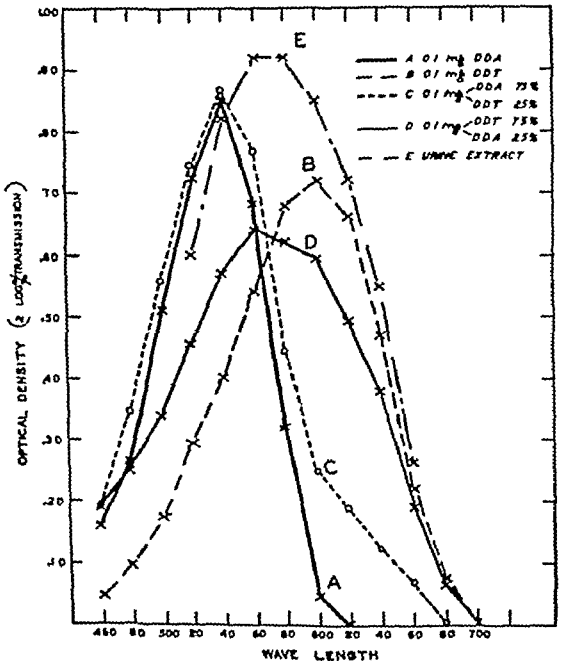

Chart 1 —Absorption curves of the nitrated products of DDT DDA and their mixtures All measurements of light transmission were made at a depth of 1 5 cm. and a total volume of 15 cc

discomfort increased He took some magnesium sulfate for relief in about two hours he vomited and by the following day he had fully recovered except for the soreness of the throat, which persisted for another day or two

When consulted July 3 I requested a sample of urine This was brought to the laboratory July 4 The urine presented a heavy opalescence, which did not clear on acidification with acetic acid When shaken out with ether in a separatory funnel it became perfectly clear Since the sample contained so much ether soluble material it was strongly suspected that the urine was contaminated with the insecticide and no further work was done with it.

On the sixth and eighth days following the incident (July 8 and 10) two small samples of urine were collected under the personal supervision of Dr Bartsch The pooled sample measured 300 cc. It was acidified with acetic acid and extracted with ether and the ether was dehydrated with anhydrous sodium sulfate, washed with water and evaporated to dryness by the same method used for the determination of organically bound chlorine in the urine of poisoned animals [2] The residue was taken up in 10 cc. acetone, and one fifth of this was evaporated to dryness and nitrated by the method of Schechter and Haller [3] The nitration product after extraction with ether was taken up in 10 cc of benzene. Five cc of this treated with 10 cc. of

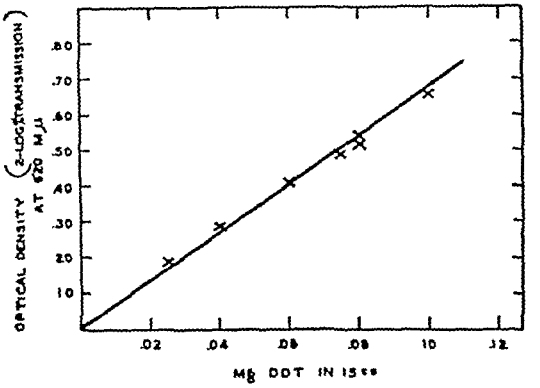

Chart 2 —Optical density at 620 millimicrons plotted against a graded series of concentrations of nitrated DDT in mixtures of nitrated DDT and DDA A linear relationship is indicated The data are given in detail in the table

10 per cent sodium methylate in methyl alcohol gave a purplish blue solution which on spectrophotometric analysis showed an absorption maximum at 560 580 millimicrons The absorption curve obtained by plotting optical density (2-log per cent transmission) against wavelength as shown in curve *E* chart 1, is similar in all essential respects to curve *D* which represents the nitrated product of 0 1 mg of a mixture of pure DDT [4] and DDA,[5] 75 per cent of the former and 25 per cent of the latter Absorption maxima for the nitration products of the pure compounds are 540 millimicrons for DDA and 600 millimicrons for DDT as shown in curves *A* and *B* respectively When mixtures of the pure compounds in the proportion of 75 per cent DDA and 25 per cent DDT are nitrated the absorption maximum does not change, as seen in curve *C* Nitrated mixtures of pure compounds with a preponderance of DDT show a change of absorption maximum from 600 to 560 or 580 millimicrons as shown in curve *D*

Quantitatively it has been possible to estimate the amount of DDT in mixtures of DDT and DDA by plotting optical density at 620 millimicrons against concentration Pure DDA shows no light absorption at this wavelength, and any light absorption at this point is related to the DDT in the mixture This is shown in the table and in chart 2

*Absorption Maxima and Optical Density at 620 Millimicrons of Nitration Products of DDT, DDA and Their Mixtures*

| Mg in 15 Cc | | Absorption Maximum Millimicrons | Optical Density at 620 Millimicrons |
|---|---|---|---|
| DDT | DDA | | |
| 0 000 | 0 100 | 540 | 0 000 |
| 0 025 | 0 075 | 540 | 0 190 |
| 0 040 | 0 060 | 540 | 0 285 |
| 0 060 | 0 040 | 540-560 | 0 410 |
| 0 075 | 0 025 | 560 | 0 490 |
| 0 080 | 0 040 | 560-580 | 0 510 |
| 0 080 | 0 000 | 600 | 0 520 |
| 0 100 | 0 000 | 600 | 0 660 |

The nitrated product derived from the urine under discussion had an absorption maximum at 560 millimicrons (curve *E*, chart 1) and an optical density of 0 72 at 620 millimicrons This indicates a mixture of DDT and DDA, with a preponderance

4 p-p dichlorodiphenyl trichloroethane

5 p-p dichloro diphenylacetic acid

of the former, and reference to the curve in chart 2 indicates 0.106 mg. of DDT. Simple calculation indicates 1.06 mg. of DDT and about one fourth of this of DDA in the 300 cc. specimen of urine. Assuming an elimination of 1,500 cc. of urine per day, it may be concluded that about 5 mg. of a mixture of about 75 per cent of DDT and some 25 per cent of DDA per day was excreted on the sixth and eighth days after the incident.

Four specimens of urine ranging in amounts from 250 to 400 cc. obtained from as many laboratory workers (three of whom have been in contact with DDT for nearly three years) gave no evidence of containing anything resembling DDT or DDA. The sensitivity of the test as carried out in this laboratory is such that 0.01 mg. could be estimated quantitatively, and considerably less than this could be detected qualitatively.

## COMMENT

On the basis of organic chlorine determination it has been shown that the elimination of DDT or its degradation products in the urine of poisoned rabbits reaches a peak on the second to the fourth day; it tapers off by the sixth day but continues to be eliminated in small amounts for two weeks or longer.[6] Of the chlorinated excretory products in the urine of rabbits about 80 per cent has been identified as p-p' dichlorodiphenylacetic acid.[7] No data on the fate of DDT in other animals or man have been reported so far. The results of the analysis in the present case appear to indicate that unchanged DDT was excreted in the urine along with a relatively smaller amount of the acetic acid degradation product.

The clinical features in this case present but little interest. Evidently the dose ingested was too small to cause serious effects. The nausea and vomiting may or may not have been due to the ingested DDT.[8] The transient symptoms of stiffness and pain in the jaws and the anxiety felt by the subject during the first day appear to be the counterpart of hyperexcitability and muscular tremors and twitchings, especially noticeable around the head, seen in animals within a few hours of ingesting a toxic dose. Recovery was rapid and apparently complete, with no delayed or persistent effects such as were reported by Wigglesworth[9] in his case of poisoning by skin absorption. Unfortunately he made no urinary analysis to substantiate the diagnosis. The value of urinary analysis for DDT or degradation products as an aid in the diagnosis of suspected poisoning has been demonstrated in experimental animals, in which organically bound chlorine is found long in advance of any detectable symptoms in chronic poisoning with small subtoxic doses.[6] Analysis of the nitration products by spectrophotometric methods as outlined herein greatly increases the sensitivity of the test.

It should be added that in the course of some work now in progress about a dozen compounds chemically related to DDT have been examined spectrophotometrically. The nitration products of only two, p-p' dichlorodiphenyl dichloroethane (DDD) and p-p' dibromo diphenyltrichloroethane have given absorption curves similar to that of DDT. The nitration products of three of the compounds, p p' dichlorodiphenyl dichloroethylene (DDD'), p-p' dichlorodiphenyl acetic acid (DDA) and p-p' dichlorodiphenylketone (DDK) gave similar curves with an absorption maximum at 540. One of the compounds so examined, p p' dichlorodiphenyl methane (DDM), showed after nitration an absorption maximum at 520 millimicrons. The excretion product in the urine of rabbits fed DDD gives an absorption maximum after nitration at 540 millimicrons and appears to be DDA. The details of this work will be published later.

## SUMMARY

A case of mild poisoning possibly due to DDT resulted from the accidental ingestion of an unknown amount of this substance through chewing of contaminated tobacco. Nausea, vomiting, a state of anxiety and stiffness and pain of the jaws were experienced for several hours and soreness of the throat for two or three days. Analysis by spectrophotometric methods of a pooled specimen of 300 cc. of urine obtained on the sixth and eighth days after ingestion showed the elimination of about 1 mg. of a substance which gave an absorption spectrum similar to that of a mixture composed of 75 per cent DDT and 25 per cent p-p' dichlorodiphenylacetic acid.[10]

# ALUMINUM HYDROXIDE GEL FOR EROSIONS IN PATIENTS WITH BOWEL FISTULAS

M. H. F. FRIEDMAN, Ph.D.
Philadelphia

A problem frequently encountered in the management of the patient with an ileostomy or colostomy is excoriation of the skin around the fistula. The more prevalent use of bowel exteriorization as a technic in surgery of the bowel in casualties of "total warfare"[1] has made this a problem of war surgery. In addition, the frequent establishment of bowel fistulas as procedures in various stages accompanying resection of segments of intestine for carcinoma or colitis has made the problem an important one in civilian practice.

The prime cause of the skin erosion in the vicinity of an intestinal fistula is believed to be in most cases the digestive action of the draining intestinal fluids. The proteolytic enzymes responsible are probably mainly of pancreatic origin,[2] thus the contents from the duodenum have a more corrosive action than the contents from the ileum, and the contents from the colon are least corrosive. For this reason colostomies are usually less troublesome with respect to excoriation than are ileostomies.

Treatment in the past has consisted mainly in protecting the affected area from the digestive action of the intestinal drainage fluid. Continuous aspiration of the intestinal contents has been tried.[3] The involved region has been covered with either various metallic compounds, such as aluminum and gold paints, or collodion, latex and other substances which resist digestion or with emulsions and oils which likewise are not digested and also "shed" the intestinal fluid. That these procedures have had indifferent success is attested by the frequency with which skin erosions persist,[1] and the continued search for a better form of treatment.

Treatment involving destruction or inactivation of the proteolytic enzymes has recently been suggested. Since certain detergents, such as sodium lauryl sulfonate, are known to inactivate pepsin and trypsin, the use of detergent ointments has been advocated.[4] However, we[5] have found that the

Therap. **84**: 375, 1945.

8 In cats vomiting has been observed not infrequently some hours after the oral administration of DDT.

9 Wigglesworth, V. B.: A Case of DDT Poisoning in Man, Brit. M. J. **1**: 517, 1945.

10 Since this paper was written two other reports have appeared on DDT poisoning in man, one by R. A. M. Case (Toxic Effects of 2,2 Bis [p-Chlorophenyl] 1,1,1 Trichloroethane [DDT] in Man, Brit. M. J. **2**: 842, 1945) showing the absorption of DDT through the skin and the other by K. R. Hill and G. Robinson (A Fatal Case of DDT Poisoning in a Child with an Account of Two Accidental Deaths in Dogs, ibid. **2**: 845, 1945) indicating 150 mg. per kilogram being lethal in a child. The latter is consistent with data on the $LD_{50}$ of DDT in some experimental animals as worked out in this laboratory (Smith and Stohlman, footnotes 2 and 6). Neither of these reports gives any data on the metabolism of DDT in man.

From the Department of Physiology, Jefferson Medical College.

This study was carried out with the cooperation of Dr. A. A. Walkling and the members of the resident staff of Surgery A (Dr. Thomas A. Shallow, chief) of Jefferson Hospital.

inactivation of trypsin in pancreatic juice by sodium lauryl sulfonate is dependent on the order of application of the enzyme and detergent to the substrate, and hence in practice the results obtained are unpredictable. Furthermore, treatment of 2 colostomy patients with salves containing sodium lauryl sulfonate gave poor results and was unsatisfactory, since the patients complained of extremely severe burning at the site of application

Theoretically it should be possible to control the extent of skin erosions by bathing the affected area in solutions having a $p_H$ unfavorable for digestion Since the optimum $p_H$ for tryptic digestion is between 7 0 and 8 0 (the exact value depends on the nature of the substrate), Selous and Perryman[6] have applied acid buffered gels ($p_H$ 5 0) to the excoriated tissue. At this $p_H$ the digestive action of trypsin is believed to be nil. While the benefits obtained by these English workers clearly show the role of $p_H$ control in digestion, some of their experimental results are more probably explained on the basis of the adsorbing action of the gel (which consisted of gelatin potato and gelatin or polyvinyl alcohol)

Pavlov[7] early called attention to the skin erosions which occur in dogs with experimental pancreatic fistula and noted the value of adsorbents in overcoming the deleterious effects of the pancreatic juice In 1940 the Komarovs[8] reported that colloidal aluminum hydroxide inactivated pepsin, and in some recent studies (unpublished) we found that it also inactivates trypsin in vitro The Komarovs also reported disappearance of ulcerated skin areas around the stoma of Pavlov pouches following routine injections of aluminum hydroxide into the pouch

After verifying in a series of more than 50 dogs equipped with either gastric fistulas or gastric pouches that colloidal aluminum hydroxide prevents the frequently noted serious digestion of skin and underlying tissues by the draining gastric juice, we felt that possibly similar treatment would benefit dogs with excoriation and ulcers due to leakage from intestinal fistulas Professor J Earl Thomas and I have treated some 20 dogs having more or less extensive destruction of the skin and underlying tissues in the vicinity of duodenal and jejunal fistulas The results obtained were so promising that material was made available to members of the surgical staff of Jefferson

Fig 1—Skin erosions around colostomy wound before treatment.

Hospital for treatment of patients with ileostomies or colostomies This brief note is prompted by the gratifying results obtained to date on 23 patients, several of whom are still being studied

The presence of proteolytic enzymes in the bowel drainage fluid of some of these patients was verified by actual determination

The aluminum hydroxide was applied to the ileostomy or colostomy in the form of a thick paste. We found it simplest to prepare this paste from the more liquid aluminum hydroxide gel, which is already available as an acid adsorbent in the

Fig 2—Same area after treatment with aluminum hydroxide paste Healing was complete in ten days The photograph was taken on the nineteenth day

treatment of peptic ulcer[9] Either one of two procedures equally simple, was used. The commercially prepared gel was poured into wide evaporating dishes and allowed to evaporate with occasional stirring at room temperature for thirty-six to forty-eight hours or until the desired consistency was attained or else the proper consistency was reached by low speed centrifugation, the supernatant liquid portion being discarded A third procedure, that of thickening the gel by triturating with powdered calcium carbonate, kaolin, starch and aluminum hydroxide, was also used on numerous occasions, but the paste so prepared, while otherwise satisfactory, was not as smooth as the other pastes and tended to harden and cake much more readily

The paste is applied in thick portions to both the excoriated area and the everted intestinal mucosa, the whole then being covered in the usual manner with several layers of gauze. When the skin is badly eroded or inflamed it is advisable to change the paste dressing every few hours during the first two or three days

Unmistakable objective evidences of healing were noted by the second day of treatment. Subjectively the patients early reported relief from the itching and sensation of burning The paste tends to absorb fluid, and the drier skin was said to be a distinct comfort. Once the skin had healed, we found it sufficient to apply a new layer of paste only when the dressings were changed because of soilage. It is of course unnecessary to emphasize that the wound be cleansed frequently Oils and oily solutions should not be used as cleansing agents since this prevents the aluminum hydroxide from adhering to the skin

In 2 instances sulfathiazole and in 1 instance benzocaine were incorporated in the paste. However, the value of these substances so applied to the 3 patients is doubtful since pain and spread of infection were readily arrested in other patients by the aluminum hydroxide paste alone.

A typical example of the effectiveness of the paste is shown in the accompanying illustrations A woman aged 42 had extensive erosions around the colostomy which had stubbornly refused to heal under treatment with various ointments, petrolatum gauze dressings and metallic paint Aluminum hydroxide paste applied over the area about six times daily produced alleviation of pain on the second day and almost complete healing by the tenth day

We have found that little or no proteolytic enzyme could be detected in the drainage fluids of 2 patients with extensive perifistular erosions It would seem that possibly the digestive

9 Wyeth Incorporated supplied the aluminum hydroxide gel

fluids from the intestine may have an irritant action in addition to a digestive action These irritant substances may be products of protein cleavage or substances produced by the intestinal flora The adsorbent action of colloidal aluminum hydroxide on bacterial toxins and on prothrombin[10] has been reported Our results would strongly suggest that the irritant substances from the intestine also are rendered inactive by the aluminum hydroxide. Finally it should be pointed out that other adsorbents may possibly prove effective in skin excoriations Certainly in several of their cases the favorable results of Selous and Perryman may be interpreted as being due to adsorption of the intestinal drainage fluid on the dressing material they employed

To the recent comments[11] on the offensive odors from bowel fistulas may be added the fact that aluminum hydroxide gel is an efficient deodorant and that attending nurses have noted the odors from fistulas to be much reduced by application of the aluminum hydroxide paste

Of no little importance is the consideration that the patient might develop a local or systemic reaction to the medications None of our patients have had skin reactions, and no special dermatitis has been reported in pharmaceutical chemists and others engaged in the preparation of aluminum hydroxide gel

AUSTIN SMITH, M D, *Secretary*

**PRIVINE HYDROCHLORIDE**—Naphazoline Hydrochloride — 2(1-naphthyl-methyl)imidazoline hydrochloride — $C_{11}H_{12}N_2.HCl$—Molecular weight-246 73 The structural formula of privine hydrochloride may be written as follows

*Actions and Uses*—Privine Hydrochloride is a vasoconstrictor, which, when applied to nasal mucous membranes, causes a prolonged reduction of the local swelling and congestion It is of value in the symptomatic relief of disorders of the upper respiratory tract such as nasal congestion of allergic and inflammatory origin, acute and chronic rhinitis, vasomotor rhinitis and acute and chronic rhinosinusitis Care should be exercised, however, when vasoconstrictors are used for prolonged medication, privine hydrochloride is no exception although the rebound congestion of the mucosa which it may cause can be alleviated within a few days simply by discontinuing all nasal medication Those who respond with rebound congestion may tolerate solutions weaker than the commonly used concentrations The site of action is possibly the peripheral sympathetic nerve endings, a property assumed for epinephrine, although further work is needed to clarify this point. So far, there have been no reports proving that sufficient drug is absorbed following local application to increase the blood pressure, although this possibility should not be forgotten.

*Dosage*—Adults may use several drops of the 0 1 per cent or 0 05 per cent solution, depending on the relief obtained and the sensitivity of the individual mucosa Relief can be expected for several hours Occasionally a smarting sensation and sneezing may develop

For children, the 0 05 per cent solution is suggested

Privine hydrochloride solution is buffered to a *pH* of 6.2-6 3 It is affected by aluminum and should not be used in atomizers made of this material Otherwise the preparation can be employed by any of the conventional methods

*Tests and Standards*—

Privine hydrochloride occurs as a white odorless, crystalline powder possessing a bitter taste It is freely soluble in water and in alcohol very slightly soluble in chloroform and practically insoluble in benzene and in ether

Privine hydrochloride melts between 255 and 260 C. A 1 per cent solution of privine hydrochloride is clear and colorless it has a *pH* of about 6.2 and responds to tests for chloride

Place about 0 5 Gm of privine hydrochloride in a separator, add 25 cc of water saturated with sodium chloride and 5 cc of 10 per cent sodium hydroxide solution Extract the mixture with five 15 cc portions of residue free ether wash the combined ether extracts with two 5 cc portions of water, filter, and evaporate the ether solution to near dryness on a water bath Remove the remainder of the ether in a stream of warm air and dry the residue at 70 C the melting point of a portion of the characteristic crystalline residue is between 117 and 120 C

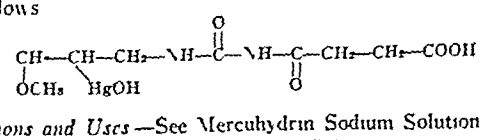
A 0 05 per cent solution of privine hydrochloride yields a white precipitate with phosphotungstic acid a mauve crystalline precipitate melting at 158 to 160 C with Reinecke s salt and a yellowish crystalline precipitate melting at 193 to 196 C with picric acid

Dry about 0 5 Gm. of privine hydrochloride accurately weighed for four hours at 70 C the loss in weight does not exceed 0 4 per cent Incinerate about 0 5 Gm of privine hydrochloride accurately weighed the residue is not more than 0.2 per cent

Transfer about 0 2 Gm of privine hydrochloride accurately weighed to a suitable Kjeldahl flask and determine the nitrogen content according to the method described in Methods of Analysis of the Association of Official Agricultural Chemists fifth edition page 26 art 23 the amount of nitrogen is not less than 11 15 per cent nor more than 11 40 per cent when calculated to the dried substance

Transfer about 0 2 Gm of privine hydrochloride accurately weighed to a 400 cc beaker and determine the chloride content according to the method as described in Methods of Analysis of the A O A C., fifth edition page 34 art. 49 the amount of chloride found corresponds to not less than 14 15 per cent nor more than 14 40 per cent when calculated to the dried substance

Transfer about 0 2 Gm of privine hydrochloride accurately weighed, to a separator add 5 cc of water to dissolve the salt and then add 10 cc of normal sodium hydroxide previously saturated with sodium chloride Extract the mixture with six portions (25 20 15 10 10 and 10 cc.) of ether wash the combined ether extracts with two 5 cc portions of water extract the water washings with two 10 cc portions of ether and combine these extracts with the main ether extract Evaporate the ether solution contained in an Erlenmeyer flask to near dryness on a water bath and complete the removal of ether in a stream of cool air add 10 cc of neutral alcohol to dissolve the residue dilute to about 50 cc with water and titrate with twentieth normal hydrochloric acid using methyl red as the indicator Each cubic centimeter of twentieth normal hydrochloric acid is equivalent to 0 01234 Gm of privine hydrochloride the privine hydrochloride content found is not less than 97 0 per cent



CIBA PHARMACEUTICAL PRODUCTS, INC, SUMMIT, N J

**Solution Privine Hydrochloride 0 1% (For Adults Only)** 30 cc and 480 cc bottles Each 100 cc contains privine hydrochloride 100 mg, exsiccated sodium phosphate 258 mg, sodium chloride 324 mg, potassium chloride 223 mg and potassium biphosphate 742 mg, preserved with merthiolate 1 100,000

**Solution Privine Hydrochloride 0 05% (For Children)** 30 cc and 480 cc bottles Each 100 cc contains privine hydrochloride 50 mg, exsiccated sodium phosphate 258 mg, sodium chloride 331 mg potassium chloride 223 mg and potassium biphosphate 742 mg preserved with merthiolate 1 100,000

**MERCUHYDRIN**—Meralluride—A mercurial compound derived from equimolecular quantities of mercurated allylsuccinylurea and theophylline—Mercuhydrin contains not less than 31 0 per cent and not more than 33 0 per cent of mercury, when dried over sulfuric acid for twenty-four hours—($C_7H_{16}O_4N_2Hg$ + $C_7H_8O_2N_4$)—Molecular weight 629

The structural formula of the mercurated allylsuccinylurea, 1-(methoxy oxymercuripropyl)-3 succinyl urea may be written as follows

*Actions and Uses*—See Mercuhydrin Sodium Solution

*Dosage*—See Mercuhydrin Sodium Solution

*Tests and Standards*—

Mercuhydrin occurs as an odorless white crystalline powder possessing a slightly bitter taste It melts between 197 and 200 C It is gradually decomposed by light and is incompatible with hydrogen sulfide and fumes of strong acids An aqueous suspension of mercuhydrin is acid to litmus

Mercuhydrin is soluble in hot water but is practically insoluble in water alcohol chloroform and ether at 25 C it is soluble in glacial acetic acid in aqueous ammonia solution and in sodium hydroxide solution It is slowly soluble in sodium bicarbonate solution with evolution of carbon dioxide

Place about 0.5 Gm of mercuhydrin in a small flask add 5 cc of water and 3 cc of formic acid boil the mixture under a reflux condenser for ten to fifteen minutes a gray precipitate of metallic mercury is formed Decant the hot solution through a small filter paper and allow the filtrate to cool (chill in ice water) Collect the crystals of allylsuccinylurea on a small filter paper wash with two 5 cc portions of ice water allow to drain and dry the crystals over sulfuric acid in a vacuum desiccator for twenty four hours the crystals melt between 145 and 148 C

10 Quick A J On the Relationship Between Complement and Prothrombin, J Immunol **28** 87 (Jan ) 1935

11 Babcock W W Odorous Wounds and Fistulas J A M A **129** 1094 (Dec. 15) 1945 Narat J K. Odorous Wounds and Fistulas ibid. **130** 238 (Jan 26) 1946

Heat the filtrate and washings obtained in the foregoing test to the boiling point and then pass hydrogen sulfide through the solution for ten minutes filter, cool the filtrate transfer to a small separator add 10 Gm of sodium acetate and extract with three successive 10 cc. portions of chloroform Evaporate the combined chloroform extracts nearly to dryness on a water bath and complete the drying by means of a stream of warm air Suspend the residue in 5 cc of water boil to dissolve the residue filter while hot and cool the filtrate in a bath of ice water to allow crystallization Filter wash the crystals with water allow to drain and dry in a desiccator over sulfuric acid for twenty four hours the crystals melt between 270 and 274 C and respond to identification tests for theophylline

Suspend about 0 5 Gm of mercuhydrin in 5 cc of sodium acetate solution and dissolve by the addition of just sufficient tenth normal sodium hydroxide (about 8 5 cc.) Filter and divide the filtrate into two portions To one portion add 0 2 cc of sodium sulfide solution and compare with the other portion only a very faint coloration of the test solution is noticeable immediately

Dry about 1 Gm of mercuhydrin accurately weighed over sulfuric acid in a vacuum desiccator for twenty four hours the loss in weight does not exceed 3 0 per cent

Ignite about 1 Gm of mercuhydrin accurately weighed in a porcelain crucible the residue is not more than 0 1 per cent

Transfer about 0 1 Gm of mercuhydrin accurately weighed to a 50 cc Erlenmeyer flask fitted with a ground joint, add 15 cc. of nitric acid and a few glass beads connect the flask to a reflux condenser and heat to boiling for one and one half hours Cool rinse the condenser tube with water collecting the washings in the flask transfer the contents of the flask quantitatively to a 400 cc beaker and dilute to approximately 150 cc. with water Add 5 cc. of nitric acid and titrate with fiftieth normal ammonium thiocyanate, using 2 cc of ferric ammonium sulfate solution as the indicator Use a control solution containing 20 cc. of nitric acid and 2 cc. of the indicator solution in 150 cc of water to which exactly 0 3 cc of the fiftieth normal ammonium thiocyanate has been added Titrate the unknown solution to the same color intensity as the control and subtract 0 3 cc from the volume noted in the titration Each cubic centimeter of fiftieth normal ammonium thiocyanate is equivalent to 0 002006 Gm of mercury the amount of mercury found is not less than 31 0 per cent and not more than 33 0 per cent calculated to the dried substance

Transfer about 0 7 Gm of mercuhydrin accurately weighed to a 250 cc Erlenmeyer flask add 125 cc of water and 5 cc of 10 per cent ammonia solution to dissolve the mercuhydrin Add exactly 20 cc. of tenth normal silver nitrate and warm on a steam bath until the white precipitate coagulates cool to 30-40 C and filter through a medium porosity fritted glass crucible transferring the precipitate and washing with five 10 cc portions of warm (40 C) water until the wash water tests free of silver ion with sodium chloride solution acidified with nitric acid. Dissolve the precipitate on the fritted glass filter with 4 to 5 cc of nitric acid allow the nitric acid solution to filter into a clean flask without suction and finally wash the crucible with hot water until the filtrate and washings approximate 150 cc. Cool add 1 cc of ferric ammonium sulfate solution and titrate with tenth normal ammonium thiocyanate solution Use a control containing the same volumes of water and nitric acid with 1 cc of the indicator solution to determine any blank correction Each cubic centimeter of tenth normal ammonium thiocyanate is equivalent to 0 01802 Gm of anhydrous theophylline The amount of anhydrous theophylline found is not less than 29 0 per cent and not more than 31 0 per cent, calculated to the dried substance

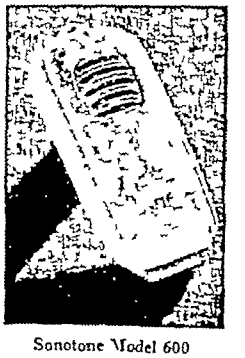
|---|---|---|
| A battery | (1½ volts) | 80 milliamperes |
| B battery | (45 volts) | 1 4 milliamperes |
| B battery | (33 volts) | 0 92 milliampere |
| B battery | (22½ volts) | 0 48 milliampere |

Frequency response adjustments The Sonotone Model 600 is equipped with a flexible set of tone control adjustments or compensators A basic tone control on the back of the instrument may be adjusted to give wide frequency response (position B) or to attenuate the high frequencies (position A) A six position secondary tone control modifies the frequency response chosen by setting the basic tone control. The low frequencies are progressively attenuated as the secondary tone control is adjusted through positions 6, 5, 4 and 3 Secondary tone control positions 2 and 1 attenuate the middle range of frequencies (approximately 500 to 2 000 cycles) A so-called 'bifocal control' placed next to the volume control and on-off switch at the top of the instrument decreases the gain of the instrument with more attenuation of the low frequencies than the high The bifocal control attenuates the gain 16 5 decibels at 250 cycles, 13 decibels at 1 000, 12 decibels at 2 000 11 decibels at 3 500 and 10 decibels at 5,000 cycles The receivers are made to certain characteristics and are so designated The N2 air conduction receiver has a gradually rising frequency characteristic up to 3,000 cycles with 8 decibels less gain at 5 000 than at 3 000 cycles The N1 receiver 'peaks broadly at 1 500 cycles and has about 17 decibels more output at 1 500 cycles than the N2 receiver Response characteristics were not obtained on the H1 (wide range) and P1 (low frequency) bone conduction receivers



*Acoustical Gain (Maximum) for Pure Tones*

(Air condution only N2 receiver)

| Frequency Adjustment | 250 | 500 | 1 000 | 2 000 | 3 000 | 4 000 | 5 000 | Cycle per Second |
|---|---|---|---|---|---|---|---|---|
| B6 | 49 5 | 48 5 | 50 0 | 63 0 | 59 0 | 55 0 | 37 5 | decibels |
| A6 | 49 5 | 48 0 | 46 5 | 49 0 | 43 0 | 39 5 | 21 0 | decibels |
| B5 | 37 5 | 38 5 | 41 5 | 57 0 | 55 5 | 52 0 | 33 5 | decibels |
| B4 | 30 5 | 32 0 | 36 5 | 54 0 | 52 0 | 49 5 | 31 5 | decibels |
| B3 | 15 0 | 23 0 | 30 5 | 50 0 | 49 0 | 46 0 | 28 0 | decibels |
| B2 | 43 0 | 39 5 | 35 5 | 46 5 | 48 0 | 44 0 | 26 0 | decibels |
| B1 | 38 0 | 32 5 | 24 5 | 47 5 | 48 5 | 44 0 | 27 0 | decibels |

These measurements were obtained with the 45 volt battery The gain is about 7 decibels less with the 33 volt and 18 decibels less with the 22½ volt battery The foregoing gain measurements would have been several decibels higher below 2,500 cycles if the N1 receiver had been used in the measurements The measurements indicate the amplification efficiency of the hearing aid at the frequency levels shown with the indicated battery voltage, receiver and tone control adjustments The 'bifocal control was not in use

Acoustical gain for speech (Bone conduction only) H1 wide range receiver, with maximum gain, 45 volt B battery B6 adjustments 36 decibels This value of 36 decibels represents the average gain for three persons each of whom had losses of from 40 to 50 decibels for air conduction and approximately normal bone conduction acuity from 256 to 2 048 cycles These persons perceived speech with 36 decibels less intensity through a high quality sound amplification system with the hearing aid than without it.

Sonotone Model 600

Physical and mechanical features The case housing the transmitter and amplifier is rectangular, with rounded corners and edges and is constructed of black plastic material The combination volume control and on-off switch and the 'bifocal control are located on the top of the instrument Both the basic and secondary tone controls are located on the back of the instrument and are flush with the case

Performance This instrument operates in an entirely satisfactory manner

Recently advertisements for Sonotone Hearing Aids have appeared in *Life* magazine. In some instances these ads have incorporated quoted statements from users of the hearings aids The use of testimonials in advertising of accepted products is against the rules of the Council

The Council on Physical Medicine voted to accept the Sonotone Model 600 Vacuum Tube Air and Bone Conduction Hearing Aid for inclusion in its list of accepted devices

## RESEARCH ON CRASH INJURIES

The National Research Council is asking physicians to help in obtaining data on the nature, location and severity of injuries sustained by victims of "survivable" aircraft accidents Except in accidents of hopeless severity, survival can—and often does—occur People frequently survive serious crashes without dangerous injuries, serious or fatal lesions often occur in moderate accidents Study of the factors that allow survival may aid in lessening dangers in aircraft and automobile accidents

Research on injuries in crashes was begun in 1942 by the National Research Council working with the Safety Bureau of the Civil Aeronautics Board and study groups in the Army Air Forces and the Navy The research was pioneered and is being carried on at Cornell University Medical College, in consultation with members of the staff of Cornell and the New York Hospital Results already available indicate that the ability of the human body to withstand crash force has been greatly underestimated

Prior to scientific analysis of accidents, authorities believed that the snubbing action of "thousand pound" safety belts would cut the body in two in severe accidents and cause serious or fatal intra-abdominal injuries in lesser accidents Study now shows that "thousand pound" safety belts frequently are broken by survivors of severe accidents without evidence of injuries of abdominal viscera, this type of injury is reported among less than 1 per cent of survivors when the belt is used A similar belief that restraining harness would snap pilots' necks prevented early use of this safety gear By observing results of accidents the combination of safety belt and shoulder harness in military ships now has been increased in strength to hold the pilot against forces of 8,000 pounds The end point of human tolerance, where crash force is properly distributed, has yet to be determined

Because of the great dangers involved, human subjects cannot be exposed to extreme force in controlled experiments All possible information must therefore be obtained when exposures to force occur accidentally In order to relate resulting injuries to causative structure, Air Safety Investigators of the Civil Aeronautics Board now present special medical forms prepared by the National Research Council to physicians who observe victims of accidents An anatomic chart permits recording of areas of fatal lesions and the site of other injuries The weight of the injured person (an important factor in high speed accidents and safety belt breakages), the degree of concussion (mild, moderate or severe), the period of unconsciousness and evidence of intracranial or other internal injury are noted Clinical facts are the basis for judging the severity of injury in respect to the severity of the accident The location of contused areas on the head or torso in moderate accidents have given significant evidence on causes of fatal lesions under more severe conditions

Reports which physicians have returned to crash injury research of the National Research Council already have brought about notable improvements Instrument panels, for example, which were reinforced so solidly that they demolished the head under heavy impact blows are now being redesigned By using ductile instead of solid structure, the energy of heavy "fatal" blows can be distributed and absorbed without fracturing the skull—frequently with only mild or moderate evidence of "concussion"

Control wheels of cast materials which have been found broken in crashes causing puncture of the chest with intrathoracic lesions now are being replaced by wheels which will support the chest and cause lesser injuries of the chest under extremely severe conditions Structures which repeatedly caused massive injuries of the knees are being eliminated and elements substituted which moderate the chance of such injuries

When accident details and medical details from large numbers of crashes are related and analyzed, many improvements can be made Safety is basically the avoidance of injury Serious and fatal injuries can be avoided in many future accidents when the nature and cause of typical injuries are known Much that is being learned about airplane crashes has applicability in the field of motor car accidents The value of the physician's contribution to future safety through this work cannot be overemphasized

## WARNINGS ON THIOURACIL LABELS

The Food and Drug Administration has announced that pharmacists who dispense thiouracil on prescription must place a warning on the label cautioning the patient that this drug may impair resistance to infection and suggesting that the patient should report to his physician immediately at the first sign of fever, sore throat or other symptoms of a cold The Federal Food, Drug and Cosmetic Act exempts drugs dispensed on a written prescription of a physician from bearing a statement of the quantity of contents and a statement of the

active ingredients on the label The law does not, however, exempt such drugs from the requirement that the labeling bear adequate directions for use or warnings necessary for the protection of users

Thiouracil is a dangerous drug and may cause drug fever, skin rashes, leukopenia and agranulocytosis The most important step in treatment of the complications of thiouracil [1] is early recognition of the complications and prompt institution of appropriate therapy

The Food and Drug Administration is reported to have consulted with experts experienced in thiouracil treatment and to have stated that the consensus of these experts favored the placing of a warning to the patient on the label of the drug when dispensed on prescription This warning apparently is intended to supplement and reinforce warnings given orally by the physician Physicians should recognize that the pharmacist is required by federal law to place this warning on the label of the drug, even though it has been dispensed on written prescription This requirement on the part of the pharmacist may disturb normal pharmacist-physician relationship unless the physician is aware of the ruling Presumably the ruling is intended to prevent, as much as possible, needless deaths from this useful but potentially dangerous drug

## PREVENTION OF ERYTHROBLASTOSIS FETALIS

A study which may in time result in the development of a practical method for the prevention of erythroblastosis fetalis has been reported by Homburger [1] of Harvard Medical School

In 1922 Swift [2] of the Rockefeller Institute showed that rabbits which received sodium salicylate in daily doses of from 0 16 to 0.2 Gm per kilogram of body weight and at the same time were given intravenous injections of Streptococcus viridans or of washed sheep red blood cells had a greatly diminished formation of agglutinins, hemolysins and complement fixing antibodies Homburger immunized groups of guinea pigs and rabbits by repeated intraperitoneal (guinea pigs) or intravenous (rabbits) injection of washed rhesus cells Half of the animals of each group received 0 16 Gm per kilogram of sodium salicylate either by stomach tube (guinea pigs) or by subcutaneous injection (rabbits) Seven days after the final injection the plasmas of all animals were titrated for anti-Rh agglutinins, Rh-positive human erythrocytes being used

Fifteen of the 21 animals that had not received sodium salicylate showed relatively high titer anti-Rh agglutinins Of 18 animals which had received sodium salicylate only 2 showed slight traces of these agglutinins On account of the known toxicity of the drug Homburger [3] does not feel justified in suggesting a trial of salicylate therapy in the prophylaxis of erythroblastosis fetalis in man His experiments, however, do show the possibility of some future chemotherapeutic approach to the control of isoimmunization

Another promising lead is the "opposition factor" or "anti-immunity substance," recently described by Day [4] of the Pathological Institute, St Mary's Hospital, London This presumptive hapten is relatively specific for the pneumococcus It is found in pneumococcus autolysate and in the autolysates of certain other bacteria [5] Injected with pneumococcus vaccine, the "opposition factor" specifically "blocks" or otherwise inhibits the development of pneumococcus immunity Its in vivo action is presumably analogous to the well known in vitro blockade by specific hapten If Day's work is confirmed eventually some Rh hapten may be found that will specifically block the development of sensitivity to the Rh antigen

## BODY DISPROPORTIONS AND PERSONALITY

The possible relationship between body build and personality is intriguing Recently Seltzer [1] reported an extensive comparison of physical measurements in relation to dominant personality traits The work is based on 258 "normal" young men and includes an analysis of the frequency of certain dominant personality traits with relation to a considerable number of body disproportions The latter included stature tall for body weight, shoulders broad for circumference of chest, head large for size of chest and hands large for body weight Men with the disproportions mentioned (or one of the seven others of a similar type) were found to have a greater frequency of certain dominant personality traits, indicating lesser stability, lesser integration, greater sensitivity and complexity of personality and lesser capacity for making easy social adjustments Seltzer states that some of the traits which go with these bodily disproportions are "unstable autonomic functions," "less well integrated," "mood fluctuations," "bland affect," "inhibited," "cultural," "lack of purpose and values," "inarticulate" and "asocial" Conversely, those men with traits indicating personality soundness or stability had fewer disproportions in their physiques than the average of the group as a whole The author suggests that the disproportions are constitutional and as such may indicate a genetic element in the determination of personality and behavior This hypothesis, as Seltzer himself points out, requires verification and must wait further study with other groups in different age levels and with varying cultural backgrounds Even

1 Seltzer Carl C Body Disproportions and Dominant Personality Traits Psychosom Med. 8 75 (March April) 1946

if correlations of this kind prove to be statistically significant, it would also be worth while to study the many exceptions before drawing any conclusions of a clinical or psychologic nature

## PRESIDENT TRUMAN VETOES OPTOMETRY CORPS BILL

For a number of years optometrists have persistently urged the Congress to enact legislation to establish an Optometry Corps in the Medical Department of the Army During the present Congress they were successful in inducing the Senate and the House of Representatives to pass legislation to create such a corps, H R 3755, introduced by Representative Short of Missouri President Truman, however, has refused to approve this bill and in justification of his action had this to say in his veto message of May 9

In my opinion a separate Optometry Corps would be out of harmony not only with the present structure of the Medical Corps but also with the contemplated organization of the Medical Department of the postwar army

During the course of the war the Army has utilized optometrists to the maximum extent consistent with sound medical practice. The Medical Department of the postwar army will likewise utilize optometrists to the maximum extent practicable It is contemplated that they, together with the other professional and scientific groups included in modern medical service, will constitute a Medical Service Corps with appropriate commissioned rank However, our military personnel are entitled to the best medical care available, and the creation of additional separate corps will, in my opinion, hinder rather than facilitate the accomplishment of this aim. Medical care must be directed and coordinated by officers professionally trained and competent to recognize pathologic conditions and assume complete responsibility for adequate care

Furthermore, H R. 3755 would establish a promotion plan providing more rapid advancement for optometrists than for most other branches of the Army, and no persuasive reason is apparent why this particular group should be afforded more favorable treatment than others similarly situated.

## STANDING ORDERS FOR THE INDUSTRIAL NURSE

The Committee on Education of the American Industrial Nurses' Association has written to the Council on Industrial Health calling attention once again to a curious evasion of responsibility by physicians who direct medical departments of industrial plants These physicians seem reluctant to prepare, sign and administer standing orders for industrial nurses The nurses contend rightfully that without such orders they are often called to perform services for which they are not prepared or which they are not legally entitled to perform A simple refusal by a nurse to provide such an unwarranted service can be misunderstood by an employer If she can point to specific instructions, her position is strengthened tenfold Standing orders in industry as in hospitals constitute the professional status on which professional nursing standards rest The Council on Industrial Health has prepared model standing orders to be modified as the supervising physician and industrial circumstances dictate [1] Yet, even with this kind of assistance, many a nurse testifies that her medical director will not write orders or if prepared under his verbal direction he will not sign them To help the nurse out of her quandary, committees on industrial health in state medical societies should adopt standing orders for use by nurses in industrial dispensaries with the understanding that these will operate unless replaced by specific orders prepared by the physician in charge Only in this way can the chain of responsibility and continuity of professional relations which have existed so successfully in other forms of community medical service be satisfactorily maintained in industry

1 Standing Orders for Nurses in Industry, by Council on Industrial Health, American Medical Association, J A M A 122: 1247 (Aug 28) 1943

## DR. CHANNING FROTHINGHAM'S TELEGRAM

The record of the hearings on the Wagner-Murray-Dingell bill include a telegram sent by Dr Channing Frothingham, who now bears the title of chairman of the Committee for the Nation's Health, Inc. The telegram sent to many who did not answer was submitted with the signatures of fifty physicians who presumably telegraphed to him their approval The hearings brought out, through questioning by Senator Donnell, the opinion that nobody could really understand the telegram since it was phrased in confused diction Now a letter appears in *Philadelphia Medicine* for May 4, signed by Drs Edward B Krumbhaar, Joseph Stokes Jr, Francis D W Lukens, George I Blumstein and T Grier Miller, who say that they do not approve the national health program now under consideration and that they do not approve the Wagner-Murray-Dingell bill Apparently all that Dr Frothingham was able to accomplish by sending his message broadcast was to confuse a good many doctors who wanted to assert their desire to be of the utmost help in a wider distribution of medical care and to place a good many men under false pretense in the record of the hearings as supporting the Wagner-Murray-Dingell bill

## CONFERENCE ON RURAL HEALTH

Elsewhere in this issue (page 553) are published abstracts of the proceedings of the first National Conference on Rural Health This conference was held in the Palmer House in Chicago on March 30, 1946 Representatives attending and taking part in the conference came from almost all sections of the country, thus demonstrating the truly national character of the meeting Differences in point of view on the economic aspects of providing health services for rural areas were manifest Opinions on these matters were freely expressed in a spirit of cooperative endeavor aimed at meeting the medical needs of the large and important rural population The papers and discussions indicate that real progress is being made in developing the technics necessary to supply the benefits of modern medical progress to all

# MEDICINE AND THE WAR

## NAVY

### NAVY PLANS MEDICAL CENTER FOR GUAM

The U S Navy has planned a large medical center for Guam to include a 300 bed memorial hospital for natives and medical schools for native practitioners and nurses, in addition to the naval hospital and a tropical medicine research unit The Guam Medical Center will serve as the headquarters of a medical program designed to furnish medical care for all Pacific islands under navy jurisdiction Until the new hospital is constructed, natives are receiving treatment at a 300 bed quonset hospital operated by the Navy Fourteen outlying dispensaries serve all communities in Guam

### MEDICAL COLLEGE OF THE STATE OF SOUTH CAROLINA COMMENDED

A Mark of Commendation by the Navy Department was recently presented to the Medical College of the State of South Carolina, Charleston, by Capt. Marvin G Kennedy, commanding officer of the Regional Navy V-12 Unit

### NAVY AWARDS AND COMMENDATIONS

#### Captain Waltman Walters

Capt. Waltman Walters, Rochester, Minn, was recently commended by the Secretary of the Navy 'for outstanding performance of duty as chief of the Surgical Service and as surgeon in charge of the Dependents Unit, United States Naval Hospital, Philadelphia, from Dec. 28, 1944 to Oct. 23, 1945 Captain Walters aided materially in organizing and administering a high type of resident training for medical officers in the Philadelphia Naval Hospital, which achieved the recognition and unqualified approval of the American board for certifying specialists He maintained effective liaison between the surgical service of the Naval Hospital and the teaching institutions and surgical groups of Philadelphia and rendered counsel and guidance to the Rehabilitation Board while serving as a member of that activity His professional skill and tireless efforts on behalf of war casualties reflect the highest credit on himself and the United States Naval Service." Dr Walters graduated from Rush Medical College, Chicago, in 1920 and entered the service July 1, 1942

#### Lieutenant Commander Lawrence J Keenan

Lieut. Comdr Lawrence J Keenan, Fond du Lac, Wis, was recently awarded the commendation ribbon for meritorious service in connection with the early development of Guam as a senior medical officer of the 23d naval construction battalion The citation accompanying the award stated that, "working day and night under difficult conditions, he succeeded in the elimination of all sources of contagion His careful attention given to each man in the battalion kept the maximum number of men working on vitally needed projects such as the Orote field activities and the inner harbor development. His professional skill, leadership and devotion to duty were an inspiration to all with whom he served and were in keeping with the highest traditions of the U S Naval Service' Dr Keenan graduated from Marquette University School of Medicine, Milwaukee, in 1935 and entered the service Jan 18, 1943

#### Lieutenant Commander John H Sulzman

A Letter of Commendation was recently awarded to Lieut. Comdr John H Sulzman, Troy, N Y, for meritorious conduct in the performance of his duties in the Medical Research Department, Submarine Base, New London, Conn., from April 1945 to December 1945 ' The citation stated that, by his comprehensive and tireless studies in the field of visual research and his far sighted planning in connection with a program of visual training, he was of invaluable aid to all branches of the armed forces and contributed materially to the successful prosecution of the mission of this command His conduct throughout was an inspiration to all with whom he served and in keeping with the highest traditions of the Navy of the United States" Dr Sulzman graduated from Columbia University College of Physicians and Surgeons, New York, in 1932

#### Captain George Marshall Lyon

The Legion of Merit was recently awarded to Capt. George Marshall Lyon, Huntington, W Va, "for exceptionally meritorious conduct in the performance of outstanding services to the government of the United States as medical officer in connection with the safety of personnel employed in the Manhattan project An outstanding authority in the field of gas warfare, Captain Lyon readily assumed his weighty responsibilities in connection with the medical aspects of the Manhattan project and, applying with resourceful initiative the principles of his varied scientific knowledge and expert technical skills, effected sound protective measures for the safety control of service personnel and civilian employees engaged in essential duties By his keen foresight, tireless efforts and experienced judgment Captain Lyon greatly facilitated the development of a vital weapon which subsequently proved to be an important factor in the speedy termination of the war, and his loyal cooperation and professional achievements toward this end reflect great credit on himself, the medical profession as a whole and the United States Naval Service." Dr Lyon graduated from Johns Hopkins University School of Medicine, Baltimore, in 1920 and entered the service April 20, 1942

#### Captain Cecil Henry Coggins

The Bronze Star was recently awarded to Capt. Cecil H Coggins, Oroville, Calif, for "meritorious service as a field medical officer with the United States Naval Group in China from Oct. 30, 1943 to April 15, 1945 Participating in raids, ambushes and patrols with guerrillas behind the Japanese lines, Captain Coggins performed various types of medical duties ranging from major surgical operations in the field to organizing medical training classes in first aid, minor surgery and field hygiene, in which he instructed the Chinese doctors and first aid men in the basic principles of his profession. He also organized and operated a small mobile field hospital which was instrumental in saving many American and Chinese lives, thereby rendering valuable and heroic service in this hazardous theater of war His courageous conduct, disregard for his own safety and devotion to duty under difficult and perilous conditions reflect the highest credit on Captain Coggins and the United States Naval Service." Dr Coggins graduated from Jefferson Medical College of Philadelphia in 1930 and entered the service June 16, 1930

#### Lieutenant Commander Herbert R Brown Jr

The Bronze Star was recently awarded to Lieut. Comdr Herbert R Brown Jr, Rochester, N Y, "for meritorious service in connection with operations against the enemy as medical officer in charge of the Naval Whole Blood Distribution Center at Guam, Marianas Islands from Nov 1, 1944 to Sept 21, 1945" Dr Brown graduated from the University of Rochester School of Medicine and Dentistry in 1939 and entered the service June 11, 1942

#### Commander Murray Glusman

The Bronze Star and the Presidential Unit Citation with Oak Leaf Cluster were recently awarded to Comdr Murray Glusman, New York. Dr Glusman graduated from New York University College of Medicine, New York, in 1938 and entered the service July 7 1941

# ARMY

## ARMY AWARDS AND COMMENDATIONS

### Colonel Harold C Lueth

The Army Commendation Ribbon was recently awarded to Col Harold C. Lueth, Chicago According to the citation accompanying the award, "During World War II the Medical Department carried out its mission with outstanding success This achievement was made possible only through the combined efforts of all Medical Department personnel Your service with the Medical Department has been exceptional when compared with others of the same grade of similar position, and I wish to commend you for your outstanding contribution as liaison officer between the Office of the Surgeon General and the American Medical Association from March 15, 1942 to Feb 25, 1945" Dr Lueth graduated from Northwestern University Medical School, Chicago, in 1930 and entered the service Oct. 1, 1940 He was recently appointed dean of the University of Nebraska College of Medicine, Omaha (THE JOURNAL, April 27, p 1253)

### Lieutenant Colonel Laurence Miscall

Lieut Col Laurence Miscall, New York, was recently awarded the Legion of Merit for exceptionally meritorious conduct in the performance of outstanding services as surgical service coordinator and center consultant in thoracic surgery for the 6810th Hospital Center (Provisional) and later for the 804th Hospital Center during the period of July 11, 1944 to March 18, 1945 The citation stated that "Lieutenant Colonel Miscall achieved spectacular results in his determined effort to afford every possible care to wounded and suffering men who came for treatment. His singular professional ability and devoted practice of his profession combined in the development of a peerless thoracic surgical service which contributed a large share to the rehabilitation of men in the fighting forces of the United States" Dr Miscall graduated from Cornell University Medical College, New York, in 1930 and entered the service Aug 24, 1942

### Lieutenant Colonel Charles C Verstandig

The Army Commendation Ribbon was recently awarded to Lieut Col Charles C Verstandig, Hamden, Conn The citation accompanying the award stated that "during World War II the Medical Department carried out its mission with outstanding success This achievement was made possible only through the combined efforts of all Medical Department personnel" Said Major General Kirk "Your service with the Medical Department has been exceptional when compared with others of the same grade of similar position, and I wish to commend you for your outstanding contribution as medical director, Armed Forces Recruiting and Induction Station, New Haven, from March 1, 1943 to Dec 31, 1945" Dr Verstandig graduated from the University of Tennessee College of Medicine, Memphis, in 1939 and entered the service Aug 1, 1940

### Lieutenant Colonel Milton Kissin

Lieut. Col. Milton Kissin, New York, was recently awarded the Soldier's Medal "for heroic actions and services on Aug 19, 1945 On that date, prior to the surrender of the Japanese, he was sent to Canton as a member of one of the Allied emergency liaison teams by direction of the commanding general, U S Forces, China Theater, to establish initial liaison with prisoners of war and civilian internees in that area. This team, consisting of seven other American officers and enlisted men, eight Allied officers and men, landed at the White Cloud Airfield at Canton on Aug 19, 1945, preceded by leaflets dropped to Japanese and Allied personnel in the area and announcing the arrival of the humanitarian mission At the time of this landing the members of the team were told that air strips on all other fields in the area were mined and that the perimeter of the White Cloud strip was heavily mined. Through negotiations with Japanese authorities by American members of the team, arrangements were made for the team to remain as guests, begin a partial performance of their mission and even report by radio so long as messages were approved by the Japanese. However, as Allied members of the team made it obvious, even to the Japanese, that they did not consider it safe to remain, the team commander made the decision to depart and return later with a team made up entirely of American personnel In his heroic performance of a dangerous assignment Major Kissin reflected great credit both on himself and on the United States forces in the China theater" Dr Kissin graduated from Cornell University Medical College, New York, in 1928 and entered the service in November 1942.

### Colonel Cleve C Odom

The Legion of Merit was recently awarded to Col Cleve C. Odom, commanding officer of Mason General Hospital, Brentwood, N Y The citation accompanying the award stated that "Colonel Cleve C Odom, Medical Corps, Army of the United States, while serving as commanding officer of Mason General Hospital, distinguished himself through outstanding service. Colonel Odom expanded Mason General Hospital from a 1,320 to a 3,032 bed hospital during his tenure of command and provided instruction of the highest quality for medical officers and nurses undergoing instruction in the School of Military Neuropsychiatry operated at this station. Through his broad experience in neuropsychiatry and hospital administration, untiring efforts, remarkable initiative and enthusiastic and virile leadership, Mason General Hospital attained a prominent place in military neuropsychiatry and administered the best of care and treatment to the neuropsychiatric patients of the Army His cumulative achievements reflect great credit on himself and the medical corps" Dr Odom graduated from Vanderbilt University School of Medicine, Nashville, in 1916 and entered the service July 1, 1920

### Major Daniel F Crowley

The Silver Star was recently awarded to Major Daniel F Crowley, New York, "for gallantry in action on the afternoon of Nov 1943 near Italy Learning that there were some casualties in a draw about 2,000 yards from the battalion aid station, this officer and three enlisted men proceeded in an ambulance across a large open field, under constant enemy observation and heavy artillery fire. Finding one man dead and the other seriously injured, they administered first aid to the injured man The ambulance had attracted a heavy concentration of enemy fire, and while lifting the litter into the ambulance one man was instantly killed by a shell Undaunted by the continued heavy shelling directed at their ambulance, they drove back across the open field and brought the wounded man to safety The courage under fire and high sense of duty displayed by these individuals on this occasion is in keeping with the highest traditions of the military service." Dr Crowley graduated from the National University of Ireland in 1922 and entered the service April 19, 1943

### Major Philip E Zanfagna

The Army Commendation Award was recently presented to Major Philip E Zanfagna, Lawrence Mass, "for performance of meritorious service while serving as post medical inspector, assistant chief of medical service, prisoner of war dispensaries officer, medical and sanitary supervisor of prisoner of war branch camps, Hospital Center, Camp Forrest, Tenn, from April 1945 to December 1945 Displaying unusual initiative, devotion to duty and administrative ability," said the citation accompanying the award, "Major Zanfagna (then captain) was largely responsible for the high medical and sanitary standards among prisoner of war units and contributed materially to the successful operation of this center" Dr Zanfagna graduated from Boston University School of Medicine in 1934 and entered the service July 29, 1942

### Lieutenant Colonel Bernard J Pisani

Lieut. Col. Bernard J Pisani, New York, was recently awarded the Legion of Merit for "exceptionally meritorious conduct in the performance of outstanding services as director of the Medical Field Service School, European Theater of Operations, from February 1943 to October 1944" The citation

further states that "Lieutenant Colonel Pisani's organization of the curriculum and assembly and instruction of the teaching staff of the special medical department school revealed a competence of the highest type. His supervision of the field training and professional education greatly increased the efficiency of the service of the nurses and medical officers who attended the school Lieut Col Pisani's services during this period reflect the highest credit on himself and the armed forces of the United States"

Lieutenant Colonel Pisani was also honored with the Bronze Star Medal during the period of Feb 13, 1945 to May 8, 1945 for "meritorious service in connection with military operations as executive officer, professional services division, Office of the Surgeon, Communications Zone, European Theater of Operations The citation accompanying this award stated that in addition to his administrative duties Lieutenant Colonel Pisani's professional qualifications as a surgeon and gynecologist have been widely used. His unusual attributes have made him particularly valuable in the field of posthostilities training and proper redeployment of units" Dr Pisani graduated from New York University College of Medicine, New York, in 1933 and entered the service May 5, 1941

### Colonel Donald A Covalt

The Legion of Merit was recently awarded to Col Donald A Covalt, Muncie, Ind, for his services with the Army Air Forces The citation accompanying the award stated that "as convalescent training officer, Army Air Forces Hospital, Miami Beach Training Base, and later as executive officer of the Convalescent Services Program, office of the Air Surgeon, during the period from April 1943 to November 1945, Colonel Covalt rendered outstanding service of tremendous value to the Army Air Forces Medical Department and the military service at large The Convalescent Services Program which Colonel Covalt organized and directed became a model for the Army Air Forces, and the experience of this project was utilized by other branches of the service and by the military services of our Allied nations" Dr Covalt is now the assistant medical director of Medical Rehabilitation of the Veterans Administration He graduated from Indiana University School of Medicine, Indianapolis, in 1933 and entered the service May 11, 1942

### Lieutenant Colonel Paul C Morton

The Legion of Merit was recently awarded to Lieut Col Paul C Morton, New York, "for exceptionally meritorious conduct in the performance of outstanding services as chief of the surgical service, 2d Evacuation Hospital, and surgical consultant, United Kingdom, Base Section, European Theater of Operations, from Feb 22, 1942 to May 30, 1945" The citation accompanying the award further stated that "Lieutenant Colonel Morton has displayed a superior service in his pioneer studies in the relation of the drug penicillin to gas gangrene. His organization of special medical centers to care for unusual injuries were a notable contribution to the care of sick and wounded in this theater and materially assisted the medical field in the efficient performance of a vital mission" Dr Morton graduated from Harvard Medical School, Boston, in 1922 and entered the service Jan 21, 1942

### Captain A Lewis Shure

An Army Commendation Ribbon for meritorious service was recently awarded to Capt. A Lewis Shure, New Haven, Conn., for his services "from May 21, 1944 to Dec. 27, 1945 as chief of the Orthopedic Service Hospital at Fort Knox, Kentucky Accomplishing highly technical assignments with distinction, Captain Shure reflected great credit on his profession and the military service" Dr Shure graduated from Harvard Medical School Boston, in 1927 and entered the service in August 1942

## MISCELLANEOUS

### WHAT GERMAN OCCUPATION DID TO MEDICINE IN CZECHOSLOVAKIA

Francis Shattock, one of four British delegates to the World Students' Congress, visited Czechoslovakia in November 1945 In Prague he found that there were eight hospitals for 1,000,000 inhabitants, at most, he says (*St Bartholomew's Hosp J* **2** 19 [March] 1946), patients have to wait only three weeks for admission There were 9,000 undernourished children At St Anna's Hospital in Brno, of all the patients seen 30 per cent were tuberculous, and of these only 10 per cent could get proper treatment Before the war there were 10,000 doctors in Moravia and Bohemia, but the number has been reduced to 5 000 In Prague there is a center for mass radiography, but this cannot be used as films for it cannot be obtained.

The nursing situation in Czechoslovakia is critical. In 1936 there were three nurses to 30 or 40 patients during the day, and one for the same number at night In the chest and surgical blocks of the Bulovka Hospital there are only two nurses to 300 patients, and during the day only one to each ward, or 20 to 30 nurses for 300 patients

During the occupation all universities were closed and stayed closed for six years Now all the students who would have attended the universities during the war years have entered This leads to impossible conditions In Prague there are 6,000 first year medical students, 3,000 studying law, and 2,000 studying philosophy

The delegates also paid a visit to the Faculty of Medicine and saw the chemistry and physiology departments as well as the department of anatomy and the museum. In the department of anatomy the professor and his assistant were busy preparing wall diagrams and anatomic models to replace those destroyed by the Germans These are of inestimable importance in the absence of textbooks and lack of sufficient subjects for dissection It is impossible to teach anatomy adequately to thousands of students, especially when it is realized that each student may be present in the anatomy dissecting rooms for only three consecutive weeks in the year

Venereal diseases present a problem to the Czechoslovakian medical service on account of the German occupation. The German authorities during the occupation said that the German soldier on leave in Czechoslovakia had to be provided for, of course he was not allowed to produce a child with a woman of the 'low" Czech race, so that they had to find prostitutes Before the war this profession was practically extinct in Czechoslovakia, a condition brought about by an act for the prevention of venereal disease The situation changed completely after the German occupation of the country Figures are quoted in a document produced by the German police which stated that in 1938 in Prague there were only 440 prostitutes In 1941 the number had increased to 5,000 A third of these were German women, this is a fantastically high proportion when it is remembered that the German population in Prague was only 3 per cent.

During a reception given at his palace by President Benes to all the delegates of the World Students' Congress, Shattock had the opportunity of meeting the rector of the Charles University of Prague. He had spent two years in the Terezin concentration camp, where he performed all his operations with a razor His only drugs consisted of a small amount of aspirin.

There is a shortage of penicillin in Czechoslovakia The Koumc Colleges in Brno were visited by the delegates, as it was there that many medical students were killed The delegates placed wreaths around the three gallows, which had accounted for hundreds of lives of students, professors and patriotic Czechoslovakians They saw the Castle of Brno, which would have been the largest underground concentration camp in Europe, it was in the process of construction when the Russians freed the country Here they saw the special death chambers, with their floors sloping to a gutter in the center to carry away the blood, the gas chambers and also the chapel, where the altar had been removed, and in its place there was a colossal German eagle, weighing 51 tons, in front of which was the Holy Writ of the New Order—a copy of Mein Kampf in an illuminated cabinet.

## ARMY MEDICAL CORPS OFFICERS RECOMMENDED FOR/OR RELIEVED FROM ACTIVE DUTY

### Illinois

Roberg O T Jr Lt Col 2339 E North Geneva Ter, Chicago
Was Harold, Major, 10855 Indiana Ave, Chicago

### Louisiana

Tisdale Albert A, Medical Center Bldg Lafayette.
Weed John C, 3517½ Camp St., New Orleans
Welch, James W, 922 6th St, Alexandria

### New Mexico

Malone Earl L, Capt., 306 W 2d, Roswell

### North Carolina

Barringer, Phil L, Capt., 340 10th Ave, Hickory
Braudwell, Leslie J, Capt, Wendell.
Brookshire, Harley G Jr, Major 44 School Rd. Asheville
Brown, Frank R, Capt, 917 Walker Ave., Greensboro
Cekada Emil B, Lt. Col, 1010 Green St, Durham
Cox, Alexander M, Major, Madison.
Heimitsh, George Lt. Col, Fayetteville.
McCall, Robert E Jr, Capt, 236 S Main St, Marion
McCulloch Rudolph P, Capt., 820 Buchanan St., Durham
McGuffin William C, Major, Arcade Bldg, Asheville
Miller, Robert P, Capt, Lincolnton
Moore Roy H, Major, Box 909, Canton
Phillips, Neal J, Capt, P O Box 116, Lattimore
Pittman William A, Capt, 118 Stedman St., Fayetteville
Templeton, Ralph G, Box 80, China Grove
Thomas George J Jr 1420 Hattie Ave, Winston-Salem.
Thompson, John W Jr, Murphy
Way Samuel E., 110 Hammond St., Rocky Mount.
Wilkinson Charles T Wake Forest
Williams, Ernest H, 410 Sunset Ave Rocky Mount

### North Dakota

Barger, James D, Major Linton.
Bonzer, John D Capt., Lidgerwood
Curtis, Claude C Major Beach
Waters, Pattison A, 1233 3d St. N, Fargo
Weller, Lewis J, 1402 2d Ave. N, Grand Forks

### Ohio

Bakos, John, Capt, 10 W Miller Ave., Akron
Bayless, Francis, Lt Col, 2316 Delaware Dr, Cleveland Hgts
Beasley Norris M, Capt, Grandview Heights, Athens
Belmont Morrison H, Capt., 139 Benita Ave., Youngstown.
Berg, Theodore Capt., 115 Eastern Heights, Elyria.
Block Gordon L Jr, Capt., 801 E Mitchell Ave., Cincinnati
Bremner, Elizabeth A Capt, Red Fern Rd., Columbia Station
Brown Charles G Capt. 428 W Park Ave., Mansfield
Burton, Claud C, Lt. Col, U S Vet. Adm., Dayton.
Carson, James H, Lt. Col, 238 N 5th St., Martins Ferry
Cassaday Charles E, Capt., 781 W Town St, Columbus
Clark, Clyde E, Capt, 1112 Oakdale Ave., Dayton.
Clark, John J, 1st Lt., 82 Park Ave. West Mansfield.
Cohen, Jacob Capt., 216 Brabarton Rd., Steubenville.
Collins, James R., Major, 11311 Shaker Blvd., Cleveland
Consolo Charles W Major, 89 E Perry St., Tiffin
Cook, George W, Capt., 328 S Belle Vista, Youngstown.
Fisher, Abe A, Capt, 805 29th N E, Canton.
Fisher Alexander S, Capt, 206 W 7th St, East Liverpool
Forman, Wiley L, Major, 370 E Town St., Columbus
Foy, Paul E. Capt, 115 E Franklin, Troy
Frommeyer, Walter B Jr, Capt., 3526 Mooney Ave., Cincinnati
Garvin, Gilbert E, Capt., Blanchester
Glicklich, Earl A, Major, 3428 Burnet Ave., Cincinnati
Hahn, Carl W, Major, 11228 Harborview Dr, Cleveland.
Hahn, Paul D, Capt., Warsaw
Hardgrove, George L, Lt. Col, P O Box 13, Doylestown
Harris, Samuel, Capt., RR 8, Cincinnati
Hauser, Charles U, Major, 1253 Herschel Ave., Cincinnati
Hawk, Alpha F, Capt., 442 S Main St., Urbana
Headley, Nathan E, Capt, 237 W 8th Ave., Columbus
Hepp, Herman J, Capt., RR 6, Box 26-A, Ridge Rd, Lockland.
Hertz, Harold J, Capt., 2489 Overlook Rd., Cleveland Heights
High, Luther W, Capt., RFD 4 Millersburg

# ORGANIZATION SECTION

## National Health Program

### PLATFORM ADOPTED BY THE AMERICAN MEDICAL ASSOCIATION

*One of the ten points in this platform will be published each week*

**9 The services rendered by volunteer philanthropic health agencies such as the American Cancer Society, the National Tuberculosis Association, the National Foundation for Infantile Paralysis, Inc, and by philanthropic agencies such as the Commonwealth Fund and the Rockefeller Foundation and similar bodies have been of vast benefit to the American people and are a natural outgrowth of the system of free enterprise and democracy that prevail in the United States Their participation in a national health program should be encouraged, and the growth of such agencies when properly administered should be commended**

## Washington Letter

*(From a Special Correspondent)*

June 3, 1946

### Poliomyelitis Funds Appropriated for Public Health Personnel

Dr Thomas Parran, Surgeon General of the U S Public Health Service, and Basil O'Connor, president of the National Foundation for Infantile Paralysis, announced that $278,400 of infantile paralysis funds will be used for the training of public health personnel Dr Parran said that $228,400 of the appropriation would provide fellowships for recruits to meet the need for 1,200 physicians and sanitary engineers in state and local health departments "We believe," he explained, "that the conduct of successful programs of control and alleviation of poliomyelitis will be aided materially by the presence in health departments of well trained health officers and sanitary engineers"

### Veteran Patients to Share in Community Activities

Patients in Veterans Administration hospitals will be able to take active part in the life of the communities where their hospitals are located The Special Services Division of the agency said the plan has been adopted to help restore the confidence of sick patients through normal association with the civilian population The plan will bring to the hospitals recreational and entertainment programs, informal visits, assistance in letter writing and shopping and other services Patients will take part in civic and social activities of the communities

### Navy Nurses Would Retain Wartime Ranks

Legislation is now before Congress which would permit navy nurses to retain permanently commission rank which Congress granted to them for the duration and six months The Navy Nurse Corps was credited on its thirty-eighth anniversary by Secretary of the Navy James Forrestal with "a substantial share of credit for the Navy's low death rate of casualties" Capt Nellie Jane DeWitt is superintendent of the corps, which has 7,500 members

### Veterans Warned of Continuing Danger of Syphilis

Dr Donald M Pillsbury, chief of the Veterans Administration medical section on dermatology and syphilis, advised the 400,000 men who contracted syphilis in the armed forces during the war to visit their own doctors or public clinics to make sure that they had been cured He described the disease as the "most serious long term medical problem" continuing from the war He estimated that between 80 and 90 per cent had been cured but warned of the danger of relapse without adequate treatment and periodic checkups

### Magicians Help Fund for Nurses Memorial

Some 500 members of the Society of American Magicians will help raise funds for the war memorial in Washington for Nurses of the Armed Forces The magicians will stage a performance in Constitution Hall on May 31 during their annual convention in Washington, and the proceeds will go toward the nurses' memorial Mrs Norman Kirk is heading the memorial campaign

### Hospital Supplies Endangered by Strikes

The railway strike, which was terminated after President Truman appealed to a joint session of Congress for strike control legislation, threatened fresh food supplies of District of Columbia hospitals whose patients require a high protein diet Other hospital supplies such as medicine, x-ray equipment and bandages were reported adequate for three weeks

### Congressional Approval of Mental Institute Expected

The Senate Education and Labor Committee has approved and forwarded to the Senate floor the bill advocating a new mental health research institute at Bethesda, Md A similar bill passed the house last March, increasing the amount available for building the institute from 4 5 to 10 million dollars

### Anti-Vice Legislation Made Permanent

President Truman has signed legislation making permanent the wartime regulations prohibiting prostitution in the vicinity of military and naval establishments

## Bureau of Information

Of the several thousand medical officers who have consulted the Bureau of Information for areas needing physicians, few are inclined to establish themselves in areas where there are inadequate hospital facilities or where the community may be financially unable to support a doctor Realizing that the needs of these areas must be carefully evaluated, the House of Delegates during its meeting in December 1945 suggested that each state medical society should be urged to establish an information service This state office should at all times be in a position to furnish information concerning areas in need of physicians and a complete picture of the medical facilities and the physical and economic aspects of any community within the state The Bureau of Information should also, by the establishment of a cooperative monthly reporting system with state societies, be kept informed of areas needing physicians and from time to time seek information, either directly or *through* state medical societies, from individual physicians concerning location, type of practice and other relative data

Dr Robert Anderson of Texas, chairman of the Advisory Council to the Bureau of Information, has already sent to each state office a copy of a directive that the Texas State Medical Association sent to the county societies urging the appointment of county committees to survey regarding the present medical and hospital situation in each county and requesting the opinion of the committee regarding the need of any additional physicians or hospitals The Texas Association brought out in its letter to the county societies that no other subject is more important to the preservation of the independent practice of medicine in the state The state association must know on a statewide basis what is needed to be certain that all the people of the state have adequate medical and hospital facilities and be able to support its contentions in that regard with accurate facts and figures, carefully and thoughtfully assembled by those qualified to advise in local areas throughout the state As soon as the Texas Association receives these county reports, Dr Anderson forwards a copy for the files of the Bureau of Information at the headquarters office of the American Medical Association If this procedure

is followed in each state we shall have at all times at the central office accurate data regarding the medical care situation in each state so that studies can be made for the country as a whole.

# Official Notes

## TELEVISION PROGRAMS

The Bureau of Health Education announces changes and additional titles in the experimental pioneer telecasts over television station WKBK, Chicago, which began April 2 and which are believed to be the first telecasts sponsored by organized medicine.

Owing to the power curtailment during the coal strike, television stations were shut down The following schedule supersedes any previously published announcements

June 20 Contagious disease precautions in the home.
Dr W W Bauer
July 4 No telecast
July 18 Methods for administering drugs
Dr Austin E. Smith
August 1 Strange medical fakes
Thomas G Hull Ph D
August 15 Anesthesia.
Telecaster to be announced.

The programs are being telecast on a sustaining basis, that is, the station will derive no revenue Credit will be given on the program to Chicago medical supply firms which lend apparatus for demonstration, but there will be no other advertising Scripts will be prepared in cooperation with each medical demonstrator and coordinated by the Bureau of Health Education. Dr W W Bauer will summarize the odd numbered programs and Dr William W Bolton the even numbered programs

# Medical Legislation

## STATE LEGISLATION

### Louisiana

*Bill Introduced*—H 264, relating to the taxing powers of municipalities throughout the state, proposes to authorize, among other things, the power to levy and collect a license tax on and regulate all professions and occupations conducted within the limits of a municipality

### Massachusetts

*Bill Introduced*—H 1898 proposes the creation of a board of registration of opticians and defines an optician as "a person engaged in the filling compounding or reproducing of prescriptions of physicians or optometrists for ophthalmic lenses, eyeglasses or other optical appliances prescribed for the correction of defective vision or ocular anomalies of the human eye, and the mounting and fitting of the same to frames or supporting materials, and the adjusting of such lenses, eyeglasses and appliances to the use of the wearer" Exempted from this proposal would be licensed physicians and optometrists

*Bill Passed*—H 1922 passed the house May 10 To amend the law relative to the regulation of hospitals, it proposes to authorize the department of public health to license persons desiring to establish or maintain a hospital, sanatorium, convalescent home or nursing home. A hospital or sanatorium is defined by the proposal to be an institution, however named, whether conducted for charity or for profit, which is advertised, announced or maintained for the express or implied purpose of caring for persons admitted thereto for purposes of diagnosis or medical or surgical treatment which is rendered within said institution, except an institution caring exclusively for cases of mental diseases and licensed by or under the general supervision of the department of mental health. A convalescent home or nursing home would be defined as an institution, however named, whether conducted for charity or profit, which is advertised, announced or maintained for the express or implied purpose of caring for three or more persons, not acutely ill, admitted thereto for the purpose of chronic or convalescent care

*Bills Enacted*—H 230 has become chapter 365 of the Laws of 1946 It amends the medical practice act by authorizing the board of medical examiners to grant certificates of registration, without examination, to such persons as shall furnish with their applications satisfactory proof that they have the qualifications required in Massachusetts to entitle them to be examined and have been licensed or registered on a written examination in another state whose standards, in the opinion of the board, are equivalent to those in Massachusetts The law also provides that no person shall be registered without an examination if he is a graduate of a medical school not approved by the approving authority H 1749 has become chapter 364 of the Laws of 1946 It provides that the College of Physicians and Surgeons, a Massachusetts corporation duly organized and established in 1880, be dissolved

### Missouri

*Bills Enacted*—H 830 was approved May 17, 1946 It authorizes county courts to promulgate such rules, regulations or ordinances as will tend to enhance the public health and prevent the entrance of infectious, contagious, communicable or dangerous diseases into such county H 912 was approved May 24, 1946 It authorizes the county court of any county to levy an annual tax for the purpose of operating or maintaining a public county hospital within the county

National Tuberculosis Association Buffalo N Y June 11 13 Dr Charles J Hatfield 1790 Broadway, New York 19 Secretary

Society for Investigative Dermatology San Francisco June 30 Dr S William Becker, 55 E Washington St. Chicago 2 Secretary

# THE WAGNER-MURRAY-DINGELL BILL

## Hearings on S 1606—To Provide for a National Health Program

(NOTE.—*This is a condensation of the verbatim report of the hearings*—ED.)

*(Continued from page 469)*

United States Senate, Committee on Education and Labor

APRIL 23, 1946

HONORABLE JAMES E. MURRAY Presiding

PRESENT Senators Murray, Ellender and Donnell

### Statement of Dr John P Peters, Secretary, Committee of Physicians for Improvement of Medical Care

DR PETERS *In order to save the time of the senatorial* committee I should like to present for incorporation in the record of these hearings the official statement of the Committee of Physicians dealing with the bill S 1606, together with their statement about the previous bill, S 1050 The Committee of Physicians has consistently opposed the fee-for-service method of payment in public medical care programs because it engenders abuses, is not conducive to economy and does not promote cooperative effort. If this were allowed to become the chief or sole method of payment, existing groups and teaching hospitals would be threatened and the further formation of groups would be halted. The immediate and complete elimination of fee-for-service payment, on the other hand, would involve a revolution of the existing system of practice that might delay the development of the program The general principles on which this controversial matter is treated in title II have been wisely conceived

(*Senator Donnell brought out that Dr Peters is a full time salaried physician*)

SENATOR DONNELL *You* are appearing, *I understand*, on behalf of the Committee of Physicians for the Improvement of Medical Care DR PETERS Yes

SENATOR DONNELL How large a committee is that? DR. PETERS The committee itself is about fifty

SENATOR DONNELL Doctor, do you know of any organizations of physicians except the Physicians Forum and the committee for which you speak today who favor officially the enactment of S 1606 into law? DR PETERS Yes There are several small ones There is a group of physicians organized under the Independent Citizens Committee of the Arts, Sciences and Professions, and there are several other smaller groups One in Hollywood, that, by the way, is a branch of the Independent Citizens group There is a small one in St Louis, the committee of Physicians for the Study of Medical Care I cannot identify many of them I have a great many requests from them in correspondence continually for information from our committee.

SENATOR MURRAY Do you know of many individual physicians and surgeons who do not belong to any particular group who recognize the need of legislation? DR PETERS There is an enormous number of them, especially among the young men I would like to call attention to and put on the record the vote taken by the New York County Medical Society yesterday that shows at least there is a large minority favoring legislation The vote was 503 against the Wagner-Murray-Dingell bill for compulsory health insurance and 152 for it. That at least is not a negligible minority, and when you consider that, besides the younger men and a great many of the older men are afraid to express themselves, *you may enlarge that* minority considerably

SENATOR DONNELL As I figured hastily the vote that you refer to, 500 against and 152 for, it means that approximately 76 per cent of those voting in New York County Association were against the enactment of S 1606 Is that right? DR. PETERS I think it is significant when you ask whether there are individual physicians or groups of them that you have at the present time, after all the propaganda that has been brought about, practically 25 per cent in a medical association of that kind who can stand up and vote for the Murray-Wagner Dingell bill

SENATOR DONNELL In your statement No 15 Doctor that is the one that is filed here under that number, there appears on page 2 the statement "Compulsory insurance bills have been presented to the Congress of the United States and numerous state legislatures The popular demand for legislation of this nature is steadily increasing" Would you tell us, please, is there any state legislature in the United States to your knowledge that has thus far enacted any legislation providing for compulsory health insurance? DR PETERS Not unless they have done it very recently

SENATOR DONNELL Do you favor a revolution in the method of practice personally? DR. PETERS I think it must be changed if we are going to have the quality of care we require And I think the fact that medicine is more and more gravitating toward hospitals is one indication that we will have it

SENATOR DONNELL I asked you a little while ago, and I know you said you could not tell us, the aggregate number of associations which have affirmatively approved compulsory health insurance Would you say that in your judgment it would run as high as 10 000? DR. PETERS Well, what kind of organization?

SENATOR DONNELL I should have qualified that I meant any organizations of physicians or surgeons or both, would there be as many? I will put it this way Are there associations of physicians and surgeons in this country, including the Physicians Forum and your own committee, and any others, are there such organizations the aggregate of membership of which would in your opinion be as great as 10,000 who have expressed themselves by official action as favoring compulsory health insurance in this country? DR PETERS My opinion is that there would be that many

SENATOR DONNELL That there would be that many? DR PETERS In my opinion, and it is only an opinion, and therefore I do not know just how much it is worth I will say this *that at the end of these hearings I hope we will have a better* basis for opinion

SENATOR DONNELL The Physicians Forum, as I recall it and I may be in error in this, has 2,000 or 2,500 members somewhere in there, possibly even less than that Is that correct? DR. PETERS I do not know

SENATOR DONNELL Are you a member of that organization? DR. PETERS I am not a member of that organization

SENATOR DONNELL At any rate, the testimony of Dr Boas tells us the membership, whatever it may be SENATOR ELLENDER If you will permit me, there were a thousand in that

SENATOR DONNELL Senator Ellender calls my attention to the fact that there were only one thousand.

SENATOR ELLENDER Six hundred and some odd came out of New York and the rest are scattered throughout the country

SENATOR DONNELL I remember that very distinctly, and I thank you for mentioning that. Do you know of any other organization of physicians and surgeons that you can give us *the name of here this morning*, other than the Physicians Forum or the Committee of Physicians for the Improvement of Medical Care, which have taken any official action favorable to compulsory health insurance in this country? DR. PETERS Yes but they are very small

SENATOR DONNELL Could you give us their names? DR PETERS The Committee of House Physicians for the Study of House Care

SENATOR DONNELL That is the one that you are here appearing for? DR. PETERS House Physicians

SENATOR DONNELL How large an organization is that? DR. PETERS I do not know at the present time It is a very small one.

SENATOR DONNELL A thousand? DR PETERS Oh, no

SENATOR DONNELL A hundred? DR. PETERS I do not think so

SENATOR DONNELL Less than a hundred, you think, that is the Committee of House Physicians What is the next one? By the way, where is that committee located? DR. PETERS In St Louis

SENATOR DONNELL *Who is the head of that?* DR. PETERS Richard M Peters

SENATOR DONNELL Is he related to you? DR. PETERS Yes

SENATOR DONNELL What relationship? DR PETERS My son.

SENATOR DONNELL And when was it organized? DR PETERS It is less than a year ago

SENATOR DONNELL Was it organized to advocate the passage of legislation of this kind? DR PETERS It was organized as a study group first You asked for all the organizations I know, and it is a small group of house physicians that is expanding, and I do not think it is of great significance except to show the spirit among the younger men On the other hand, there are not organizations of that age group They are not possible, any more than there are among the veterans groups and the other younger men

SENATOR DONNELL And that is that organization We have then the Physicians Forum and this committee for which you appear the Forum constituted of a thousand members, as Senator Ellender points out, 600 of whom are in New York State and your organization that you appear for here this morning, with about 50 members, or I should say 1,500 who are in a sense associates, but the 50 is the active committee, is that right? DR PETERS Yes

SENATOR DONNELL So we have those two organizations We will count that as 1,500 for your committee, so as to be perfectly fair on it Then the House Physicians have a maximum of 100 What other organizations of physicians or surgeons in this country have passed official action favorable to compulsory health insurance? DR PETERS It is not really an association of physicians and surgeons, there is a council, medical council, and a large medical group or division in the Independent Citizens Committee which has favored it

SENATOR DONNELL Where? DR. PETERS In the Arts and Sciences branch of the Independent Citizens Committee of the Arts, Sciences and Professions

SENATOR DONNELL That is the one of which Mr Ickes is head? DR. PETERS Yes

SENATOR DONNELL I remember Frank Sinatra is in that He is not a physician DR. PETERS No, I say within that there is a division of physicians

SENATOR DONNELL Yes I did not mean any reflection on Mr Sinatra in the slightest. Undoubtedly a man of great capacity in his profession but he is not a physician is what I am getting at DR PETERS But there is a large group of physicians in their organized division.

SENATOR DONNELL How many are there? DR PETERS You would have to inquire from the offices there.

SENATOR DONNELL My recollection, Doctor, subject of course to correction by either of these other gentlemen, is that the testimony of Dr Butler or Mr Ickes, one or the other, is about 200 one of them had seen them coming together in a meeting Do you know whether there is a larger number of doctors than that? DR. PETERS There are more than that.

SENATOR DONNELL Are there 500? DR. PETERS I would have to get the figures from New York.

SENATOR DONNELL Do you think there are as many as 500 in that committee of doctors, I should say? DR. PETERS I should suspect that.

SENATOR DONNELL You think that is a fair figure, an estimate of 500? DR. PETERS Yes

SENATOR DONNELL That is what we call the organization represented here by Mr Ickes the other day What other organization in this country that you know of of physicians or surgeons has given official sanction to compulsory health insurance? DR. PETERS I do not know of any

SENATOR DONNELL You do not know of any others? Dr Peters taking your figure, first the figure of 1 000 for the Physicians Forum, taking your own organization at 1 500 which I think is perfectly liberal, because the active, as I understand it more or less active, membership is much smaller, that is right, is it not? DR. PETERS It has to be in any organization You cannot make 1,500 write a statement.

SENATOR DONNELL The actual operating membership of your organization is only about 50, but I want to ask you what the other 1 450 do which will come to that as an organization. But taking your organization as 1 500 the Forum so many, the House of Physicians of which your son is the head, and the medical components that enter into this organization of which Mr Ickes is the head, 500, we get a total of 3,100 That of course counts yours at 1,500 But let me ask you about the 1,450 in your organization who are not included in this committee of 50 What do they do in connection with the affairs of your organization? DR. PETERS They subscribe to our principles That is not the end of our mailing list. I am talking about the physicians in there They subscribe to our principles and have asked for and receive the letters

SENATOR DONNELL Are those 1,500 physicians? DR PETERS I cannot say whether somewhere between 1,400 and 1 500 at the present time We are at a loss in two respects One, we are getting new members, and the other is that servicemen are turning up that we thought were lost, and we cannot absolutely be sure what our list of servicemen is, but it is between 1,400 and 1,500

SENATOR DONNELL And do those 1,400 to 1,500 men come together in annual convention? DR. PETERS No

SENATOR DONNELL Your convention consists of about 50, is that right, sir? DR. PETERS Yes

SENATOR DONNELL And that is the committee, generally speaking, the names of whom are on this letterhead? DR PETERS That is the committee

SENATOR DONNELL Doctor, do these 1,400 or 1,500 people participate in committee memberships of your organization, or do they just subscribe and get the benefit of information? DR PETERS There is not any subscription

SENATOR DONNELL How do they join? DR PETERS They ask to join and state that they would support us and are interested in furthering our work

SENATOR DONNELL Have you taken any poll of those people to see whether or not they approve statements 16, 15 and the other statement which has been filed here? DR. PETERS Except that we send them out and ask for their criticism

SENATOR DONNELL Have you taken a poll of them to see whether they approve it? DR. PETERS No

**Statement of Dr Carl O Flagstad, Chairman, Legislative Committee, American Dental Association, Accompanied by Dr Allen O Gruebbel, Secretary of the Council on Dental Health, American Dental Association, Dr Harold Hillenbrand, Editor of the Journal of The American Dental Association, and Mr George H Fox, General Counsel of the American Dental Association and Secretary of the Committee on Legislation of the American Dental Association**

DR FLAGSTAD I am Dr Carl O Flagstad of Minneapolis, chairman of the Committee on Legislation of the American Dental Association. I have been engaged in private dental practice for thirty-five years and am a professor and chairman of the Division of Prosthetic Dentistry at the University of Minnesota The American Dental Association, whose headquarters are in Chicago, has a membership of 56 000 dentists This represents more than two thirds of the 75,000 dentists registered in the United States The Committee on Legislation, of which I am chairman, has its members elected by the House of Delegates and we serve without personal remuneration. This democratic pattern of organization with extensive membership in every state of the Union unquestionably gives the American Dental Association the right to voice the opinion of the great majority of dentists in the United States

In legislation of the type of S 1606 there has been a tendency to include dental practice and treatment under the categorical head of 'medical service." It is true that close cooperation between dental and medical practitioners exists in routine and special practice, but it does not follow that the needs and program of the two professions are identical There are some specific facts about dental disease and dental practice which must be taken into consideration before an intelligent and long-range program can be planned

1 Dentistry must include in its program provisions for treating a disease that is almost universal It is almost axiomatic that 95 per cent of our population suffer from dental diseases at some point or other in life and that an extremely high percentage need annual dental care.

2 Because of the extremely high prevalence of untreated dental defects, it is impossible to apply the insurance principle

3 The real causes of the chief dental diseases, dental caries and periodontoclasia, are not entirely known, so it is impossible to prevent them in the true sense of the word by attacking the cause. The best methods of control that are known to date are early and regular dental treatment

4 If such early dental treatment is not sought, the ensuing dental neglect becomes much more costly than timely dental treatment.

5 If early and regular dental treatment can be given to children it will assure a definite lowering of serious dental defects later in life and the production of a generation of adults comparatively free from the accumulated defects caused by early neglect.

6 The cost of providing such essential dental service for children is according to present estimates, less than one-half the cost of providing essential dental service for adults

7 Since many people do not seek dental care until great damage has occurred, it is absolutely essential to maintain a continuing program of dental health education to inform all of the importance of dental health and to motivate them to secure dental care.

8 Because of the limited number of dentists, it is impossible to carry out any program that promises complete dental care to both children and adults

9 In the face of this dental personnel problem, it is obvious that the most efficient use should be made of the present number of dentists It is the opinion of competent dental authorities that in public dental health programs the most efficient use of available dental services is to devote all needed attention to dental disease in children and provide additionally as much service as possible for adults

10 One of the reasons for dental neglect besides those already mentioned is that the prevention and control of dental diseases have never been given continuing financial support by either public or private agencies

All these factors are brought to your attention to demonstrate that legislation, even if it may be well designed to meet medical problems and conditions, is not necessarily as well adapted to meet dental problems which are quite different in nature The attitude of the American Dental Association toward the current bill, S 1606, is based largely on the fact that it does not take into sufficient account the unique complex problem of providing adequate dental care

The American Dental Association is opposed to the enactment of S 1606 because

1 The American Dental Association believes that compulsory health insurance for a majority of the population should not be established in this country without preliminary scientific experimentation involving less extensive groups of the population

2 The American Dental Association believes that it is unsound administration to disperse responsibility for health among the three agencies mentioned by the bill the U S Public Health Service, the Children's Bureau of the Department of Labor and the Social Security Board

3 The American Dental Association believes that a compulsory health insurance system basically similar to the systems in effect in foreign countries should not be established on a national basis until there is incontrovertible evidence that the American pattern is an improvement and that the errors of the foreign systems will not be perpetuated in the American program

4 The American Dental Association believes that a program the size of the one proposed should not be established without directly facing the problem of expense. This expense should be clearly enunciated in terms of both cost to the individual and cost to the nation

5 The American Dental Association believes that the grants-in-aid system has been effective in meeting certain health needs under the Social Security Act The American Dental Association believes that this system should be enlarged to meet all health needs and that there is no necessity for enacting a national compulsory prepayment plan

6 The American Dental Association believes that the right of a state to determine the methods of meeting its health needs should not be taken away

7 The American Dental Association believes that a program as comprehensive as the one proposed should not be designed without seeking the official cooperation of all agencies and professions involved.

S 1606 proposes to make emergency dental care available to larger groups of the population This proposal involves a false concept in public dental health practice because, if only emergency dental treatment is given the problem of dental disease will be as great ten or fifty years from now as it is today In contrast to this uneconomic and unscientific approach, the dental profession of this country supports the view that the problem can be solved through a coordinated program of disease prevention and dental care for children. The reasons behind this belief are realistic and practical If we cannot prevent the occurrence of dental disease, we must concentrate our efforts on dental research If we cannot provide services to all persons (which is obviously the case) the benefits of the plan must be limited to the age groups in which dental disease begins

S 1606 provides that dental benefits shall have such restricted content as the Surgeon General may determine "provided, that on and after July 1, 1947, the restricted content of general dental or special dental benefit shall include at least (1) examination (including x-ray survey) and diagnosis, (2) prophylaxis (3) extraction of teeth which are considered by the dentist and an attending physician to be or likely to be injurious to the general health of the individual, and (4) treatment of acute diseases of the teeth, their supporting structures and adjacent parts, including fractures of the teeth or jaws'

Contrast this limited, emergency type of program in S 1606 with that proposed by the Council on Dental Health for the 12-18 year age group

1 Examination using posterior bitewing roentgenograms at least once a year and other roentgenograms as may be needed.

2 Prophylaxis at intervals depending on patient need and susceptibility

3 Restoration of carious teeth with silver amalgam, silicate cement and gold

4 Pulp treatments including pulp capping, pulpectomy of vital exposed pulps and treatment of putrescent teeth in young patients

5 Restoration and appliances including prosthetic restorations to replace missing teeth and appliances to maintain space so as to prevent malocclusion

6 Treatment of mouth infection

7 Extraction of infected teeth, supernumerary teeth and impacted teeth, using local or general anesthesia

8 Surgery as may be necessary to maintain health including if necessary, root resection of infected permanent teeth

9 Health education of the patient

Authorities in the field of dentistry have agreed after a careful study that the services listed would be considered minimum services for the protection and maintenance of dental health Any amount less than that would be inconsistent with modern dental practice.

The vast difference in dental benefits of the two proposals emphasizes again the need for technical advice in planning health legislation Such advice obviously was not sought or taken into account in drafting the dental provisions of S 1606

There are other valid reasons for seriously questioning the dental benefits in the proposed legislation S 1606 provides, for example, that every insured person will be entitled to receive 'treatment of acute diseases of the teeth ' A careful reading of the bill does not disclose what is meant by the term 'acute diseases of the teeth" If dental decay is an "acute disease" of the teeth, and many authorities believe that it should be so classified then the bill promises that all types of dental procedures for treating diseased teeth would be included in the plan and only prosthetic dentistry would be excluded Under this provision the American people would not know the amount of dental health service to which they would be entitled Such vague and indefinite wordings constitute a basic objection to the proposal

The American Dental Association also wishes to raise another objection to the dental provisions of S 1606 Experience in foreign countries reveals that effective dental health programs have not been developed under the compulsory health insurance system

The following short quotations are taken from the report of an official committee of Parliament appointed to study the British dental program "Roughly, two thirds of the insured population that is between 13 and 14 million people are entitled to dental benefit, but only 800,000 (less than 7 per cent) of these claim it on an average each year ' It is the contention of the American Dental Association that there is something intrinsically wrong with a program which compels 13 or 14 million people to contribute for a service which only 800 000 receive.

Another quotation from the committee's report "The state of the dental health of our population is bad and its effect on their general health is bad" The American Dental Association does not believe that any program which must make such an admission after several decades of existence gives any indication that it will aid in rearing a generation of adults less afflicted with dental disease.

Perhaps it might be impressive to add the general opinion expressed by our veterans of the Dental Corps stationed in England during the war Their opinion is 'The Dental health of the people of England is very poor and so is their dentistry

The American Dental Association would be reluctant to end its testimony with mere opposition to the proposal that is now before this committee. So intense have been the interest and activity of the American Dental Association in this great problem of better dental health for our people that it has sponsored two measures which are also pending before this very committee S 190 and S 1099 These bills provide, as has been stated, federal grants-in-aid for intensified dental research and experimental programs in all phases of dental health education and care.

### Statement of Dr Maurice Kaufman, Accompanied By Seymour J Schoenfeld, Secretary, Dentists Committee for the Passage of the Wagner-Murray-Dingell Bill

DR KAUFMAN I am Dr Maurice Kaufman I represent the Dentists Committee for the Passage of the Wagner-Murray-Lingell bill

The Dentists Committee for the Passage of the Wagner-Murray-Dingell bill is a very new organization. It was formed out of necessity Owing to the stifling of democratic procedure within the American Dental Association, there was no other way to give public notice to proponents of the bill This new committee is composed exclusively of members of the American Dental Association and is supported entirely by contributions of dentists The chairman of the committee is Dr John Oppie McCall, who is also director of the Murray and Leonie Guggenheim Dental Clinic of New York City Among our sponsors are men who have held the most honored and trusted positions in the American Dental Association and its components We favor the Wagner-Murray-Dingell bill, S 1606, because it provides a much needed and wide coverage of essential health care to the American people It links dental care with health care, which in our opinion is its proper orientation The bill is not socialized medicine, retains free choice and protects the dentist with assurance of adequate compensation It provides incentive for dentists and protects the public against threat of deterioration of service The Dentist Committee for the Passage of the Wagner-Murray-Dingell bill fully supports this proposed legislation

---

APRIL 24, 1946

HONORABLE CLAUDE PEPPER Presiding

PRESENT Senators Murray, Pepper, Smith and Donnell

### Statement of Katharine J Densford, R N, President, American Nurses' Association

MISS DENSFORD My name is Katharine J Densford, director of the School of Nursing in the University of Minnesota and President of the American Nurses' Association The opinions which I am about to express do not necessarily reflect my personal views but are the opinions of the association as made known through boards of directors and other representatives of state nurses' associations The house of delegates of the American Nurses' Association on June 7 1944 adopted a recommendation which favors "the expansion of health insurance plans and providing for nursing service including nursing care in the home. It is believed that, in addition to voluntary effort, governmental assistance is necessary for attaining adequate distribution of health services" In order to secure definite action regarding specific legislation on the subject of a national health program now pending before Congress, it would be necessary to present the matter to the American Nurses' Association house of delegates which will convene Sept 23, 1946 The American Nurses' Association has made continuous study of all proposed legislation dealing with such matters and has through its official publication, the *American Journal of Nursing*, and otherwise, kept its constituent associations and members abreast of developments No program of health care or of health insurance, whether voluntary or compulsory, can be considered complete unless the program includes necessary nursing care Any such program should contain provisions adequate to insure that the nursing services rendered will be of high professional quality If a federal health insurance program is adopted, the administrator, namely the Surgeon General of the United States Public Health Service, should of course, be a duly licensed physician, and the program relating to nursing service and nursing education should be administered through federal and state councils composed predominantly of qualified graduate registered professional nurses

Attached hereto are statements which are being filed by the National League of Nursing Education and the National Organization for Public Health Nursing

SENATOR SMITH Just one question Miss Densford, does this imply that you are supporting the compulsory health insurance plan compulsory contributions? MISS DENSFORD Mr Chairman, before Senator Smith was able to be here, the statement as given here indicated that the House of Delegates on page 1 of my testimony, the house of delegates of the American Nurses Association on June 7, 1944 adopted a recommendation which favors "the expansion of health insurance plans and providing for nursing service, including nursing care in the home It is believed that, in addition to voluntary effort, governmental assistance is necessary for attaining adequate distribution of health services" That is the only action, Senator, that has been taken by the American Nurses' Association, with no specific action taken regarding any specific bill

SENATOR SMITH I see. They are not necessarily endorsing this bill but just the general principle of governmental assistance to the health program? MISS DENSFORD The American Nurses' Association has not taken action regarding S 1606 The only action it has taken is quoted here

SENATOR DONNELL It has taken no action affirmatively in favor of compulsory health insurance? MISS DENSFORD Neither affirmatively nor negatively There has been no action

### Statement of Mrs Beatrice F Jacobs, Chairman of the Health and Education Committee, League of Women Shoppers, Inc

MRS JACOBS It is my privilege to represent the League of Women Shoppers, a national consumers' organization. The purposes and activities of our organization have always been directed toward the improvement and protection of the American standard of living Since good health is vital and essential to that standard, we support Senate bill 1606, which will do much to promote the physical and mental well-being of our population and so insure a higher standard of living for all Americans

(*Senator Donnell brought out that the league has nine branches and that Mrs Jacobs had not seen any resolutions passed by them*)

### Statement of Mrs Sophie Anzel

MRS ANZEL I am a member of the League of Women Shoppers, and so far as I know the national executive board determines what is to be supported, and anything that the national executive board decides on is binding on the local leagues, regardless of whether they have originally passed a local resolution or not. They may have individually passed on them locally, but the national board speaks for the league always as a whole throughout

---

APRIL 25, 1946

HONORABLE JAMES E MURRAY Presiding

PRESENT Senators Murray, Donnell and Thomas of Utah

SENATOR MURRAY I would like to insert in the record at this point the report to the Education and Labor Committee on the pending bill from the Secretary of Agriculture, Hon Clinton P Anderson

(*Secretary Anderson wrote in behalf of the bill He said in part*)

SECRETARY ANDERSON The states could pay insurance contributions in behalf of their needy citizens Such an arrangement, which is permitted in the bill, would avoid the development of a dual system of medical care in which the system worked out for the needy might well be at a generally lower level of quality than for the rest of the population

With respect to inclusion of farmers and farm workers in this program, the administrative technics in collecting contributions from this group present no insurmountable difficulties The Department of Agriculture, with the aid and cooperation of the Social Security Board of the Federal Security Agency, has been working on these problems It is my understanding that what appears to be workable methods are available in assessing incomes of farmers and collecting their contributions for the insurance program

(*Secretary Anderson emphasized the shortage of medical facilities and personnel in rural areas*)

### Statement of Charles F Brannan, Assistant Secretary of Agriculture

MR. BRANNAN The 57 million Americans who live in rural areas have a tremendous stake in any program that serves the national interest. Forty-three per cent of the nation's population live in communities of less than 2,500 persons Only about 400 of our 3,070 counties are really urban, and it surprises many to learn that such an urban state as New York has a greater farm population than the five rural states of North and South Dakota, Nebraska, Wyoming and Montana combined Indeed, rural America is the continuing source of

city populations, the urban birth rate is far lower than that of farm families, and it is only the farm-to-city migration that maintains the size and growth of our cities Medical experts tell us that illness is most prevalent in the early and the waning years of life It is, thus significant in any evaluation of the rural benefits of a national health program to remember that more than half of all the nation's children under 15 years of age, and a higher proportion of persons over 65, live in rural areas

In 1940 the Farm Security Administration made a survey of low income farm families and discovered an average of more than three significant physical defects for each man, woman and child examined. Anemia, malnutrition defective vision, dental caries, hernias, childbirth injuries—such was the repeated pattern Only four out of every hundred were free of significant defects

Perhaps the most sensitive indicator of health standards is the infant mortality rate Rural areas have a rate one-fourth higher than that in large cities and in addition have a maternal mortality rate that is one-third higher Over 3,000 infants could have been saved in 1943 in Texas alone if this state had the infant death rate of urban Connecticut. That 9 more rural than urban infants die out of every thousand born alive is a reflection in part of the fact that less than half the births in rural areas occur in hospitals and many are unattended by a doctor or nurse.

The voluntary health agencies that are helpful in the cities too seldom penetrate to the farmer, and rural sections and whole rural states cannot provide the kind of public welfare services that the industrial centers are able to establish The Bureau of Human Nutrition and Home Economics has shown that less than 10 per cent of any farm income group receives free medical care Here again the less wealthy rural states are at a disadvantage from the current 50-50 matching grant formula of federal assistance

The rural needy are further handicapped by existing state statutory maxima on cash benefits and by the present legal restrictions on the use of federal funds for direct payment for medical services While in 1942 the most urban state was spending $2 92 per capita for general assistance, the most rural one could afford only $0 25

Despite the fact that 43 per cent of the population is rural, only 18 per cent of all professional medical and related personnel are in the farm and village localities Our most rural counties had, before the war, an average of 1 doctor to every 1,700 persons while the big city ratio was 1 to 650 Although it is generally agreed that the minimum proportion should be 1 to 1 000 many farm counties have been struggling with ratios of 1 to 3,000 to 1 to 5 000 or even worse, indeed, the war left eighty-one counties in the nation without any doctor at all

The lowest figures suggested for the average cost of good family medical care, about $100 a year, are beyond the reach of some 80 per cent of all farm families So lack of purchasing power results in continued deficiencies of medical care, which in turn is the forerunner of poor health Then inevitably, illness and poor health affect earning capacity and work efficiency thereby further lowering income and the ability to purchase needed care Thus the vicious circle completes itself The circle must be broken at some point And the effective means is prepayment scaled to income—health insurance for all In this way the catastrophic consequences of unexpected illness can be avoided

The fundamental solution of the problem of payment for medical services is the one proposed in title II of this bill—that of a single national plan of compulsory health insurance supplemented with general tax funds Only a nationwide plan has the actuarial soundness to provide equally comprehensive medical care to those in the cities and those in the country to those in rural as well as in urban states to the economically insecure as well as to the prosperous Only such a national plan can offer complete medical care at rates within the reach of all The limitations of the voluntary approach are overcome while exploiting to the full the principle of spreading of risks and sharing of costs

### Statement of Dr Frederick D Mott, Chief Medical Officer, Farm Security Administration, Department of Agriculture

DR. MOTT The Farm Security borrower families, who are typically in a quite low income group, have been helped to receive needed care through these programs They have had through the programs, I think, a degree of security which it is hard to overemphasize even though the services have had to be limited Of course from a hardboiled point of view this program has helped to secure government loans, something we sometimes forget. There have been other good sides of it, I mean a great deal of health experience with health insurance has been gained by farm people, some farm leaders, and by local professional medical people in over a third of the counties in the United States On the other side, though, I think our outstanding experience has been that not enough families join these plans, even when they have been organized and are right there ready to join In fact, even though there are supervisory possibilities in the Farm Security program, that is, we have county supervisors and a program of education farm and home management, and in spite of educational efforts of the county staff and the assistance of loans and so on, not nearly enough farmers tend to join the plans There were less than one third of the borrowers eligible for the plans who joined

There are other disturbing features I will be brief One is the tremendous turnover A study made by people at Ohio State University of several plans in Ohio over a period of a little over three years showed that of the families who started in the program only 24 per cent were still members at the end of a three year period In fact, of all of the families who were members at one time or another during the three years only 8 per cent had been members throughout the whole period from beginning to the end That type of turnover, of course tends to leave poor risks in the plan and that same study revealed something very interesting there They showed that the families who stayed in in continuous membership required much more service than the other families The families who stayed in throughout the three years received over 3 000 office and home calls a year per thousand people. The figure for those who were in for one year periods was 2,000, about 2,027 almost 3,000 and 2,000 showing the effect of leaving poor risks in a voluntary plan, thus keeping costs high and services low

There have been other points, such as that when people pay just from their own resources on the basis of their ability to pay benefits have to be quite rigidly limited and it has not been possible to have comprehensive plans The effect of the plans too has not been to do anything fundamental about improving local resources They simply do not mobilize the purchasing power that would bring physicians into an area or enable a hospital to be maintained better

Those I think, are some of the major points in our experience. The plans have done some good but these inherent weaknesses have certainly been perplexing and we see no other answer except a more or less universal program for the whole population, both rural and urban

SENATOR MURRAY Some complaints have been made against the system proposed under this legislation as limiting the free choice of doctors Have you any comment on that, Dr Mott? DR. MOTT Of course one point that I might bring out right at the start is that there is extremely little choice and very often no choice at all for rural people in many areas First there is the economic side. When you cannot afford medical care, it happens in the case of many of these farmers that they simply do not get the care, and that could hardly be called a choice of physicians

SENATOR MURRAY The doctors often live considerable distances from the homes of these rural people DR MOTT The distance factor comes into that raising the cost I mean we still tend to keep to what was a horse and buggy institution of a dollar a mile one way and making costs prohibitive.

SENATOR MURRAY Sometimes a single call will cost $25 in some rural areas where you have to use an automobile and go a considerable distance DR. MOTT There is another point there on this question of choice if I may say so, and that is we have of course many counties in which there is not even a single physician Towards the end of the war there were some eighty one counties with no physicians at all There were another twenty counties, which had populations of over 10,000 people, with only one doctor There is hardly much choice there. There were another fifty counties with only one doctor with populations from 5 000 to 10 000 people. There were another fifty one with only one doctor, with populations of from 3 000 to 5,000 people. Of course, I believe that under this bill freedom of choice will be increased and enhanced In the first place the economic barriers are removed, and you can go to your physician.

SENATOR MURRAY Your department has had much experience in medical care plans sponsored by state medical societies Will you give us your experience with those kinds of plans?

DR MOTT We have had some experience, sir, along those lines Of course in certain states it has been most excellent for us to work out contractual arrangements, with medical society plans In some states it has been the only way in which we could bring any protection to our borrowers, because of state enabling, or we sometimes think of them as disabling acts, making it possible for a medical care system at this time to be the only one dominated by the organized profession We have had arrangements with medical societies' plans in several states, in New Jersey, in western New York, in North Carolina, in Oregon and in California

Two or three points about our experience I think might be worth bringing out. To me one of the discouraging things about the development of plans sponsored by the organized profession is that the very group which should believe most in the high quality of service and should put every ounce of effort behind the development of programs that would produce services of high quality are doing the least They are doing the least in this way, that the plans being sponsored are restricted in the main to care received in hospitals Usually it is the end result of illness or disability of some kind or another that puts you in the hospital, not always by any means, but when one thinks of what medical service of real quality would be, preventive services, early care, diagnostic services of various kind laboratory, x-rays, consultation all the patients usually go through before being in the hospital, or frequently so, these plans are wofully weak in that respect

That brings me more closely to our own experience Virtually the only medical society plans in the United States today offering any kind of general medical service, including home and office care, are the special arrangements which we have induced the medical society plans to put into effect, often for our borrowers or for a low income group of farmers It has taken constant struggle and effort year after year and often every quarter of the year for us to keep these plans going The whole tendency of the organization is to drop plans of that type. I might cite the California Physicians Service, for example I believe there has been some testimony with respect to that organization here. We have had a plan or an agreement with the California Physicians Service for a period of something like four years There is a special contract for all farm families who wish to join, or join in groups, who have net incomes of under $2,000 The plan has been confined almost entirely to our borrowers however The rates were forced up at one stage during the last three or four years to the point where the families are now paying around $60 a year for a family of three or more for a somewhat limited service but one that does include home and office care, some hospitalization and surgical care, except for chronic conditions That is the only plan administered by the California Physicians Service for families which provides a general medical service, including home and office care.

They now are threatening, and this has gone on for some months to close out each of our local health associations at the end of the fiscal year, offering in return higher rates for less service in a contract that is almost precisely like this so-called commercial contract It is not a happy prospect for our families They will not pay more for less service, dropping home and office care, and I suppose the more or less monopoly situation is such that no other plan will be open to them if they are dropped from that program

*(In his questions Senator Donnell took Mr Brannan over the rights of the Surgeon General and other administrative agencies in the bill)*

*(By his questions Senator Donnell elucidated the opinion that the bill would require three billion three hundred million dollars a year)*

SENATOR DONNELL Doctor, there would be the necessity of having under the jurisdiction of the Surgeon General, and finally back under the direction and supervision of the federal security administrator, such employees in every city of any size in the country, would there not? That is, in the administration of this? DR. MOTT Any city of any size, I would think you are right

SENATOR DONNELL Wouldn't it be necessary almost to have somebody in every town in the country as a representative to make quick decisions as to matters arising under the compulsory insurance act? DR. MOTT I would not think so, sir Knowing rural counties fairly well, and I have not given a great deal of thought to this, but I might say, sir, that I would think that an employee in a single county would often be excessive If we get into the kind of a district organization of health services which most of us hope for, with coordination of public health and medical care services in districts, the rural district will often comprise, let us say, three counties I am not sure how much detail would be involved in this bill I would think in terms of a full time employee at such a level, that would be more logical perhaps once the system was under way

SENATOR DONNELL On page 14 of your statement you say "In a voluntary program there is little incentive for preventive medical practice and little inducement to improve the quality of medical care" Do you not think that, as a matter of fact, under the voluntary program that we have had of the administration of medicine in this country, for the entire history of the country, that there has been some incentive for doctors to advance and to progress and that there has been advancement in the country? MR BRANNAN Senator, I am a profound admirer of the medical profession, and I do think they have done wonderful things with limited facilities, but I think it is time this nation ceased to impose on them We should make adequate facilities to do the type of a job they are doing and not ask them to take on unlimited numbers of charity patients or patients from whom they cannot reasonably expect to get adequate remuneration

AFTER RECESS

### Statement of James G Patton, President, National Farmers Union

MR PATTON For many years the National Farmers Union and I personally have contended for the use of the full power of the national government to bring to rural America the facilities and lacks that are so deplorable as to shame the great nation of which we are a part I appreciate doubly, therefore, the opportunity to appear before the committee today to give unqualifiedly the endorsement of my organization and myself to the national health bill, S 1606

*(Mr Patton covered much the same statistics as had been covered by previous testimony)*

These vast needs are not being met now In the 1,000 most rural and isolated counties before the war there was only one doctor to 1 750 persons, whereas in cities there was a doctor for each 650 persons During the war the situation became even more alarming In hundreds of rural counties the war caused the ratios to rise to one physician to 3,000 to 5,000 or even in extreme cases to 10,000 persons The same thing is true of dentists and of nurses Before the war there was one dentist for 1,400 persons in the cities and but one to 4,200 in the country As to nurses, the rural state of Mississippi in 1940 had but 62 active nurses per hundred thousand persons, whereas Massachusetts, largely industrialized, had 403

The key to this situation lies in the universal compulsory prepayment plan embodied in this bill Only on such a base will it be possible to erect the structure that is needed in rural areas The most altruistic of doctors must, after all, earn a living, and a hospital cannot operate without an economic base That base does not exist in rural areas and will not exist unless a prepayment plan of the kind proposed here is adopted As Dr Henry B Richardson, chairman of the Physicians' Committee on Research, an eminent physician himself has said "You can hardly expect a doctor to settle in a small community if it is contrary to his professional growth, or if it is contrary to the interests of his family and the education of his children" Voluntary plans will not do the job This is not to condemn their efforts Indeed, the National Farmers Union not long ago inaugurated its own voluntary prepayment plan, the Triangle Health Insurance Plan, and naturally I would not have urged the adoption of that plan if I held any bias against voluntary programs But at their best such plans cannot give complete coverage Those most in need of insurance against disease are the very people who fail to benefit from voluntary programs Both membership and services of such plans are restricted, in most instances necessarily, in order to protect the structure of the program itself Then too the costs of such plans are always much higher than a universal compulsory prepayment plan, if for no other reason than that they cannot achieve the coverage that a national program can achieve. Moreover, many of those who are attracted to voluntary programs are those who expect to require medical treatment or hospital care, and hence costs are inevitably increased for all participants There is no graduation of costs in voluntary plans on the basis of the ability of those taking part to pay, whereas under the proposed national program charges are based on ability to pay Finally, many of the existing voluntary programs fail to give any representation in management to the participants, those who after all are the ones whose needs are supposed to be met. I do not believe that the adoption of the bill would mean that exist-

ing voluntary programs would be damaged, since S 1606 provides for the utilization wherever possible of existing programs

In conclusion I wish to appeal to the committee to proceed as rapidly as possible to the approval of the bill and to Congress to enact it speedily It has been said that the bill is 'state socialism," which of course is nonsense. Every advance in the use of governmental power for the people has been greeted with the same phrase Democracy does not mean impotence or lethargy To me it means the right of the people to use their government to their own ends "Government of the people, by the people and for the people" would be a futile array of words if "for the people" was omitted I think that this bill is an illustration of government not only "by the people" but "for the people" and as such illustrates the workings of democracy at its best

It has been said that the bill may restrict the freedom of choice of patients in choosing their doctors, or of doctors in choosing whether to stay in or out of the program These objections seem to me to be quibbling The bill has been carefully drawn to protect these rights within any reasonable interpretation Moreover I ask, what choice does a farmer have now in the hundreds of counties where there is no doctor at all? His only choice is made for him He must die or get well without benefit of choice.

(*Senator Donnell in his questions covered the total cost of the measure and its method of administration*)

SENATOR DONNELL At any rate your organization never has passed a resolution endorsing S 1606, that is correct, is it not? MR PATTON Yes, that is correct And I doubt that we will, until it is, that is, until it becomes the law We know what goes on up in this place and how many different times it can be twisted before it gets through, so we are not going to endorse something until we know what we are buying

SENATOR DONNELL I understand, however, if I read the language correctly, you do endorse it here today MR PATTON As it is now constituted We will also refuse to endorse it the minute it gets some bad amendments in it which we do not agree with

SENATOR MURRAY And you feel that it is only through a *universal prepayment plan of some kind* that adequate health care can be brought to the people of the United States? MR. PATTON I do

SENATOR MURRAY You do not believe that it is possible to accomplish that by voluntary systems? MR PATTON You know, Senator, out in the West, you are from the West, we tried hail insurance First the Farmers Union and some of the cooperatives tried hail insurance and as long as we had it so that to put it on their tax roll, you see the cost was away down but when we got to it so that it was a voluntary business the man who lived in a hail area always insured, but the fellow who did not would try and loop in and loop out, with the result that our cost began to go up very drastically, and the whole proposition of insurance is predicated on getting a broad enough risk to get an actuarial or an adequate, at least, sampling

SENATOR MURRAY The people who join the voluntary system are usually prompted by the fear that they are going to suffer ill health in their family MR PATTON Yes

### Statement of Mrs Jerome Evanson, Director of Education, North Dakota Farmers Union

MRS EVANSON Rural people can have adequate medical care and health services World War II proved that hitherto debatable point. During World War II we saw modern health facilities and services—the best in the world—brought to our farthest desolate outposts on the Aleutian Islands in the North Pacific. Our government provided medical care and services on the most inaccessible islands of the South Pacific, in the impenetrable jungles of Burma and India and over the "hump" to the natives in the interior of China. No spot in the world was too remote. It gladdened our hearts and made us proud, but it also made us think.

No longer can these same services be denied to our own people here at home. No longer can any one say it is not feasible to establish good medical care and services in our rural areas The war provided these services wherever there was a need for them at the war front. The peace shall provide these services wherever there is need for them on the home front, and the greatest need on the home front today is in rural areas. What a pity that it had to take a world war to awaken us to the realization that "medical care for rural people can be complete and it can be good."

To shock people out of their complacency, I would like to suggest that for every area posted as disease free for cattle we should have posted the list of needless cases of illness and deaths among the people in that area who have not had the same consideration as our cattle It may awaken some people to an awareness that even though our children haven't the cold dollars and cents value of cattle they should and must warrant the same protection that is given our cattle. That protection has definitely not been given our people in rural areas to date Shocking? Yes So are the high rejections of rural boys for the services—the highest of any major occupational group Shocking too are the figures for maternal and infant death rates and for death rates in all age groups in rural areas

We the people want to participate in the formulation of a health program We believe that those who receive services as well as those who give services should have the right of representation on councils determining quality, cost distribution of hospital care and health services Medical people seem to resent participation by lay people and seem to look on it as interference It would seem that to many people the sole responsibility of the consumer should be to furnish the patient and the fee To justify their insistence on control of programs they speak of their past record and point to the high standard of services rendered. We can only think of how bad the services are for so many of our people. They talk of the high quality, and, important as quality is, we think quantity and distribution are important too, for what good is quality when it is out of reach of the people who are ill and need it? These problems will not be overcome until lay people actively participate in the formulation of health programs

The American Medical Association is particularly opposed to the matter of compulsion—'it is so undemocratic" Would they take away compulsion in the matter of education and let every child volunteer to attend school? Would they take away compulsion in the matter of contagious diseases and leave it to the individual to isolate himself voluntarily? Would they take away the compulsion of sanitation laws, doctors' licenses or intern training or even the years one must study before one can practice medicine? Isn't compulsion a necessary safeguard where the welfare of all is at stake? The shocking revelation of health conditions in rural areas most certainly justifies compulsion in the matter of health care

SENATOR DONNELL Were you on the committee which drew up this statement of principles that Mr Patton referred to? MRS EVANSON No, I was not a member of the resolutions committee However, I was a participant in the discussions

SENATOR DONNELL You were familiar with S 1606 at the time? MRS EVANSON That is right

SENATOR DONNELL And that particular bill was not in express terms at any rate endorsed in those resolutions, was it? MRS EVANSON No

SENATOR DONNELL Simply there was a commendation of President Truman for his courage and vision in calling for a universal prepayment medical care program and calling on Congress to pass legislation to put that into effect?

MRS EVANSON However, at this meeting at this discussion we stated that we would go out and work for any health compulsory health act, as it would give expression to our objectives and we did state at that time it was the Wagner-Murray-Dingell bill and this new bill which we had not felt that we had not given the study to, that we should, but that we would endorse it as it gave expression to the objectives of our program

SENATOR DONNELL *You refer in the conclusion of your* remarks to new ideas. You say it takes courage to sponsor new ideas, to chart new courses You do not undertake to say that this idea of compulsory health insurance is a new idea, do you? MRS EVANSON No, I do not, but it is a new idea to many, many people, and it seems to be a very new idea and a dangerous new idea, seemingly, to the medical association

SENATOR DONNELL On the matter of this hail insurance that you speak of in Dakota, I presume we would agree that there are very many different problems applicable to hail insurance as distinguished from health insurance, would we not? MRS EVANSON I do not see why there should be too many

SENATOR DONNELL Just to illustrate, without going into detail, the matter of hail insurance involves first the payment of a premium, and in the second place if there is a loss by hail the ascertainment of the damage and then in the third place the collection of the damage, that boiled down is hail insurance, is it not? MRS EVANSON Yes

SENATOR DONNELL Whereas health insurance involves the matter of the selection of doctors, the question of the quality of doctors whether or not initiative of the doctors is or is not encouraged, the question as to the best means of encouraging advancement in the medical profession, the question as to whether or not there is to be a national control of health insurance, and of the selection of doctors away down the line out in your state and mine, all of those things differ from hail insurance, do they not? MRS EVANSON That is right.

SENATOR DONNELL However, that may be North Dakota tried the compulsory hail insurance, did it not? MRS EVANSON It did, that is right.

SENATOR DONNELL And later on the legislature had the matter of repeal of that up before it, did it not? MRS EVANSON Yes, it did

SENATOR DONNELL Did it repeal it? MRS EVANSON It changed, it did not repeal the law It changed it from compulsory to voluntary

SENATOR DONNELL So the question of whether or not you should retain compulsory hail insurance was in the first instance presented to the legislature, which passed a law providing for compulsory hail insurance and in the second place, later on, the legislature had before it the question as to whether compulsory hail insurance should be abandoned and voluntary hail insurance be substituted, is that not correct? MRS EVANSON That is right

SENATOR DONNELL And the legislature, whether for good or for bad reasons decided to abandon the compulsory hail insurance and substitute voluntary insurance is that not right? MRS EVANSON That is right.

SENATOR DONNELL On page 4, where you make the statement that I am wondering just what you mean by it You say "Since most diseases are preventable, then why are they not prevented? Is it because certain groups have a stake in our illness?" Do you mean to imply by that that the doctors of our country are trying to hold back this country from solving the health problems because they are going to make more money out of it if we have sickness than if we do not have it? Is that what you mean? MRS EVANSON No, but I was reminded of the experience in Manitoba, where they are hiring doctors in municipalities, where he said that he had a stake in the health of the people so it was his job to keep them healthy, and he had gone into the preventive phase of health care had developed much greater in that community, and he said it was because he had a stake in their health instead of their illness It was his job to keep them well

SENATOR DONNELL I understand, but that does not quite answer the question I had in mind and that I tried to state to you. You say "Science says that most diseases are preventable Then why are they not prevented? Is it because certain groups have a stake in our illness?" Let me say Who did you mean by "certain groups"? MRS EVANSON I would say the medical people.

SENATOR DONNELL The medical profession? MRS EVANSON They are the ones that have the stake in our illness

*(Mrs Evanson described two doctors who refused to see patients unless assured of their fees)*

SENATOR DONNELL Are those the only two doctors that you personally know of who have been guilty of this kind of unkind conduct? MRS EVANSON No, in our discussions of health out in the rural areas I have heard enough stories that made me sick,

SENATOR DONNELL You do not— MRS EVANSON Sick at heart and sick to my stomach for the things that have been done.

SENATOR DONNELL You feel that the medical profession is in many instances guilty of very reprehensible conduct, is that your thought? MRS EVANSON Yes, indeed

SENATOR DONNELL As you have indicated, you think there is this clique that places dollars above health? MRS EVANSON I want to say this— SENATOR DONNELL Just a minute. Is that right? MRS EVANSON Yes

SENATOR DONNELL I am curious to know what the difference is if any, between the underlying principles of the National Farmers Union and the underlying principles of the Grange and of the Farm Bureau Federation Do you know what the difference is, the underlying differences between them?

MRS EVANSON I can speak as far as the health program is concerned, of course. The Farm Federation, the Farm Bureau, and you very likely know their stand but they do not believe in compulsory health insurance.

SENATOR DONNELL I wanted to know what the underlying differences are between the National Farmers Union and the Grange and the Farm Bureau MRS EVANSON We believe in the security of the family type farm and a more satisfactory way of life for the farm family on the land

SENATOR DONNELL Does the Grange believe in the same thing? MRS EVANSON I think the Grange is very much socialistic, that is, I mean it is more of a brotherhood fellowship society I do not know too much of their stand I think the Farm Bureau works among the people, the larger land owners, and are concerned about them Of course this is just my own personal observation as I have seen it. We are working for the small family type farmer, and the general welfare always is considered in whatever program we take up

### Statement by Harold Aaron, M D

DR AARON I am Harold Aaron, M D I appear here as the medical adviser of Consumers Union of United States, a nonprofit organization supplying technical information on goods and services to more than 100,000 American families I am a family practitioner and have practiced medicine in hospitals and clinics as well as in private practice since 1929 In common with an ever increasing number of physicians, I am convinced that high quality medical care can be obtained only if the financial barrier to such care is removed by a system of prepayment compulsory insurance. If S 1606 is enacted into law, the great majority of American families could obtain all the services necessary for high quality care at a price that they could afford to pay

SENATOR DONNELL Doctor, you are the medical adviser of Consumers Union of the United States? DR AARON Yes, sir

SENATOR DONNELL What is that organization? DR. AARON A technical organization, nonprofit, which supplies information on goods and services to those who subscribe or belong to the organization

SENATOR DONNELL Do you know how many persons either subscribe or belong to it? DR. AARON At the present time about 105,000 people subscribe to it, or families, if you will

SENATOR DONNELL What is the annual charge that the subscribers pay? DR AARON It varies from $4 to $5 When you come in in a group, I think it is $3.50 I think if you do not come in with a group it is about $4 or $4 50 I am not altogether sure of the exact figure.

SENATOR DONNELL So there is an annual income of this organization of somewhere in the neighborhood of $425,000, is that right? DR AARON Approximately, yes, sir

SENATOR DONNELL Who are the officers of that organization, Doctor? DR. AARON Well, I do not have a statement of all the officers I have a list of the executive committee, which authorized me to appear here.

SENATOR DONNELL Will you tell us who is on that committee? DR AARON Myself, Dr Frank Beube, who is a dentist an assistant professor of dentistry at the College of Physicians and Surgeons of Columbia University, Mr Jerome H Hellerstein, an attorney, Dr Emanuel Klein, a psychiatrist, formerly on the New York Psychiatric Board, Dr Edward Reich, who is an educator, Mr Bernard Reis, a certified public accountant and executive secretary of the American Investors' Union Miss Adelaid Schulkind of the League for Mutual Aid, Dr Colston E Warne, professor at Connecticut College, Arthur Kallet, and Miss Madeline Ross

SENATOR DONNELL You say you are authorized and directed, I take it, by this executive board to come here to testify? DR. AARON The executive committee of the board

SENATOR DONNELL Do you know whether or not the organization holds meetings or conventions of its members or delegates? DR. AARON We have a yearly convention

SENATOR DONNELL When was the most recent one held? DR. AARON The most recent one was held in June of last year

SENATOR DONNELL Approximately how many people attended it? DR. AARON I do not know Approximately about fifty or sixty It was a very hot day

SENATOR DONNELL And they represented this approximately 105,000 members? DR AARON No They did not represent these 105,000 members We get the will of the 105,000 members through an annual questionnaire which we send to all our members every year, asking them for their opinion about the services, the way we have been giving them service, what criticism they have, and so on And we tabulate the answers, that is, the questions and the answers, and we also tabulate at the same time their votes for members of the board That represents the opinion of the membership

## ALABAMA

**Physician Sentenced for Income Tax Evasion**—The Birmingham *News* reported on April 1 that Dr Haickel A Elkourie, Birmingham, was sentenced to one year and one day imprisonment and fined $2 500 on charges of income tax evasion by Federal Judge Clarence Mullins in the U S District Court in Birmingham Dr Elkourie was also placed on two year probation on a third count of the indictment. The fine and prison sentence were for two other counts The prison sentence was to begin on May 31, the Birmingham *News* stated. In addition to the fine Dr Elkourie will have to pay $27 000, which represents $18 000 the government claims he owes in taxes plus a $9 000 penalty The physician was given the two years probation on one of the counts on the condition that he pay this sum Dr Elkourie was charged with evading income tax payments for 1941 1942 and 1943 He failed to report $67,000 income for these three years according to the indictment.

## CALIFORNIA

**Dr Swartout Resigns as Health Officer**—Dr Hubert O Swartout, Los Angeles has resigned as health officer of Los Angeles County, effective at the end of June He held the position for three years Dr Swartout plans to locate in Santa Maria

**The Dock Lecture**—Dr Donald I Frick, Los Angeles, gave the annual George Dock Lecture of the Barlow Society for the History of Medicine April 4 at a joint meeting with the Los Angeles County Medical Association. His subject was "Carlos Finlay and Yellow Fever"

**Cosmic Ray Healers**—On April 13 police raided open air cosmic ray centers and arrested three men on suspicion of violating the State Medical Practice Act, the Los Angeles *Times* reported. Nearly a hundred persons, most of them aged and scores of cars were clustered around the trailer establishment operated by Paul and Charles Beebe Those taking treatments clutched bare wires or wrapped them around legs arms or their neck while supposedly absorbing cosmic rays from the sun, according to the *Times* The theory on which the operators offered the treatment was that the rays were transmitted directly to affected parts of the body after being picked out of the air by wires and 'reduced' to health-giving strength. No charge was asked for being permitted to hold one of the wires but gifts of money were accepted Sandwiches, wheat, water ice cream and other food which the operators claimed had been treated by cosmic rays also were seized as evidence

**Physicians and Horticulture**—The *Bulletin* of the Alameda County Medical Association for May discusses the horticultural activities of some of its members Dr Warren B Allen Oakland president of the county society is one of the founders of the Orchid Society of California Dr Michael A Torrano is a charter member and Dr Lloyd H Hawkinson both of Oakland, is present president of the orchid group and associate editor of its quarterly magazine the *Orchid Digest* At a recent camellia show in San Francisco Dr Walker M Wells, Oakland won first prize Dr Noble H Logan, Oakland, who is official photographer of the exhibit in San Francisco and elsewhere, has won prizes for camellias roses and other flowers Other members of the county medical society engaged in horticulture as an avocation include Drs Stanley R Truman, Herman V Allington George F Calvin, Evelyn H Case, Brooks P Stephens, Demetrio E Jeffry, George V Van de Vert Kenneth A Nielson Harold A. Morse Stanley S Davis, Kenneth J Thompson, John I Phillips and Philip N Baxter, all of Oakland.

## FLORIDA

**New Director of Laboratories**—Dr Albert V Hardy who has been serving with the Office of Scientific Research and Development and the National Institute of Health, Washington, D C, has been appointed director of the bureau of laboratories of the Florida State Board of Health Dr Hardy graduated at the University of Toronto Faculty of Medicine in 1924 He once served as epidemiologist with the Iowa State Department of Health, as associate professor of preventive medicine at the State University of Iowa College of Medicine, Iowa City and as associate professor of epidemiology, Columbia University College of Physicians and Surgeons New York.

## IDAHO

**Hospital News**—The Sisters of St Francis are planning construction of an $800 000 hospital in Idaho Falls The site has been purchased and a finance committee has been appointed

**State Medical Meeting**—The Idaho State Medical Association will hold its 1946 meeting in Boise, June 17-20 Among the speakers will be

Dr James J Waring Denver Various Aspects of Tuberculosis
Dr Kenneth C Sawyer Denver Carcinoma and Gastrointestinal Complications
Dr Ward Darley Jr Denver Diagnosis of Rheumatic Fever and Rheumatic Heart Disease.
Dr Edwin Stewart Taylor Worthington Minn Practical Gynecologic Endocrinology

Dr. Charles W. Steele, Lewiston, Infectious Mononucleosis
Dr. Theodore C. Bramhall, Portland, Diagnosis of Cancer of the Cervix
Dr. Edward I. Herlihy, Bangor, Small Bowel Obstructions
Dr. Edward H. Risley, Waterville, Progress in Handling Surgical Diseases of the Colon
Dr. James M. Parker, Portland, Deep Thrombophlebitis
Dr. Leo J. McDermott, Portland, Epiphysial Injuries
Dr. Thomas A. Martin, Portland, Colles's Fracture
Dr. Chester S. Keefer, Boston, Streptomycin
Dr. Joe Vincent Meigs, Boston, Wertheim's Hysterectomy

In addition the program will include a symposium on gastrointestinal bleeding. Dinner and luncheon speakers will include Mr. John O'Connell, Bangor, editor, Bangor *Daily News*, Dr. Harry C. Loos, Ross-Loos Medical Group Clinic, Los Angeles, and Dr. Charles G. Heyd, New York, past President of the American Medical Association.

## MASSACHUSETTS

**Walter Cannon Memorial to Be in France**—A memorial to Dr. Walter B. Cannon, late George Higginson professor of physiology at Harvard Medical School, Boston, is to be established in Toulouse, France. A hospital there, organized and staffed by Spanish refugees from Franco to serve their fellow refugees in France, is to be expanded and operated under its new name, the Dr. Walter B. Cannon Memorial Hospital. Dr. Cannon, who was president of the American Association for the Advancement of Science in 1939, actively aided the Spanish Republicans from the start of the Civil War in 1936 to the end of his life. He became chairman of the Medical Bureau to Aid Spanish Democracy in 1937 and at his death was honorary co-chairman, Boston chapter, Joint Anti-Fascist Refugee Committee. Through the Unitarian Service Committee the Joint Anti-Fascist Refugee Committee has been helping the 150,000 or so Spanish refugees remaining in France after three years of war and seven years of destitution and suffering. Ineligible for aid from the Red Cross, UNRRA or the French government, these 'people without a country" are said to be as acutely in need of medical care as almost any one in the world. They depend entirely on American charity. Some 150 prominent Boston citizens, including thirty-seven physicians, have just started a drive for $75,000 to buy some of the necessary equipment for the hospital in Toulouse and to safeguard its continued operation. All funds are managed and spent in France by the Unitarian Service Committee. After Spain returns to democracy, the memorial to Dr. Cannon will be perpetuated there. Co-chairmen of the drive are Dr. George R. Minot, professor of medicine, Harvard Medical School, Boston, Frederick May Eliot, D.D., president American Unitarian Association, Ralph Barton Perry, professor of philosophy, Harvard University, Boston, and Paul T. Smith, attorney. Headquarters of the Dr. Walter B. Cannon Memorial Fund are at 14 Beacon Street, Boston.

## NEW YORK

**Rochester Academy Awards Prizes**—Dr. William W. Percy, Rochester, executive director of the Rochester Academy of Medicine since 1939, was given life fellowship in the academy at a meeting, May 14. The honor was accompanied with a citation for "outstanding services to the academy." Formerly president of the Rochester Medical Association, Dr. Percy was instrumental in joining that organization with the Academy of Medicine to form the present Rochester Academy of Medicine. The academy also presented the following prizes to Rochester physicians for the work indicated: Dr. Searns S. Bullen, the Albert Kaiser Medal for his work in the field of allergy; Dr. Jacob W. Holler, the John W. MacCauley Prize for his paper "Potassium Deficiency Occurring During the Treatment of Diabetic Acidosis'; Dr. George P. Heckel, The Paine Drug Company Prize for his paper on "The Association of Ovarian Pain with Ovarian Dysfunction, the Role of Estrogen and the Importance of Conserving Ovarian Tissue," and Dr. Herbert R. Brown, Jr., the Taylor Instrument Company's prize for his paper on "The History and Analysis of Human Whole Blood Distribution in the Pacific Area."

### New York City

***George Humphreys Named Professor of Surgery***—Dr. George H. Humphreys has been appointed Valentine Mott professor of surgery at the Columbia University College of Physicians and Surgeons and director of surgical service of Presbyterian Hospital, it was announced May 28. Dr. Humphreys succeeds Dr. Allen O. Whipple, who will retire in September after twenty-five years' service. Dr. Humphreys graduated at Harvard Medical School, Boston, in 1929 and is currently assistant professor of clinical surgery at Columbia, a position he has held since 1940. He is also assisting attending surgeon at Vanderbilt Clinic and the Babies and Presbyterian hospitals.

**State Plans Mental Hygiene Expansion.**—A mental hospital to cost $15,000,000, with beds for 3,160 patients, will be erected on Ward's Island in the East River as part of the state's postwar public works program, according to the New York *Times*. The project contemplates an outlay of $10,005,000 for the first group, which will be a medical and surgical building, a unit for the care of disturbed and continued-treatment patients, two admission service blocks, administration quarters and a central kitchen. Preliminary plans for fourteen additions proposed by the department of mental hygiene are under preparation for the planning commission. The estimated cost of these is in excess of $5,000,000.

**Physicians Warned of Sending Patients to Arizona**—The New York Tuberculosis and Health Association has informed the five medical societies of New York City of an exchange of communications with Arizona health and business organizations. The information is given as a warning to physicians who are sending their patients in search of an ideal climate to hasten their cure from asthma and other conditions. The housing shortage is still acute in Arizona, it was stated, with no immediate relief in sight. The chambers of commerce in Arizona are cooperating in an effort to locate suitable facilities for patients. One chamber of commerce issued a special monthly housing bulletin in which it reported 343 applications for housing in March 1946 and only 127 placements. No furnished houses were available and there were only two apartments during the month. C. Edgar Goyette, secretary of the Tucson Chamber of Commerce, in reply to a query from the New York Tuberculosis and Health Association stated that 'during the past year we have had the most difficult and acute housing shortage in our history,' and Mr. Goyette adds, 'we would earnestly suggest, in view of conditions, that definite arrangements be made for housing before coming to Tucson."

**Israel Weinstein Named Health Commissioner**—Dr. Israel Weinstein, acting health commissioner of New York, has been appointed health commissioner, filling the vacancy that occurred when Dr. Edward M. Bernecker resigned (THE JOURNAL, March 23, p. 805). Dr. Weinstein graduated at Columbia University College of Physicians and Surgeons in 1926. He has been associated with the health department since 1924, serving in a full time capacity since 1936. At the time he was named acting health commissioner, Dr. Weinstein was first deputy commissioner. On the resignation of Dr. Ernest L. Stebbins, Dr. Edward M. Bernecker was on March 4 appointed by Mayor William O'Dwyer as commissioner of health. The selection invited considerable protest primarily because it was believed that Dr. Bernecker, in his position as commissioner of hospitals of the city health department, did not have the proper qualifications and practical experience for a public health administrator and his name had not been included in a group of candidates recommended by a specially appointed committee or in a group recommended by the board of health. The recommendations totaled some thirty-eight names. Dr. Bernecker resigned the position on March 13 and was immediately reappointed to his former position as commissioner of hospitals. Following the appointment of Dr. Weinstein as acting commissioner, March 13, press reports indicated that Drs. Dean A. Clark and Leonard Greenburg were being considered for the appointment but on May 24 Dr. Weinstein was named to the post. Prior to his appointment as deputy health commissioner Dr. Weinstein had been released from military service with the rank of lieutenant colonel.

## NORTH CAROLINA

**Valy Menkin Goes to Philadelphia**—Dr Valy Menkin, assistant professor of pathology at Duke University School of Medicine, Durham, has been appointed associate professor of experimental pathology in the newly created department of surgical research at Temple University School of Medicine, Philadelphia (THE JOURNAL, Dec. 1, 1945, p 972)

**Good Health Association.**—The North Carolina Good Health Association was organized in Thomasville March 14 with Mr I G Greer superintendent of the Baptist Orphanage, Thomasville, as president. Lieut Col Charles R Jones was elected executive vice president Objectives of the program are

State assistance in the care of indigent sick
State assistance, in accordance with wise provisions for building or enlarging local hospitals and establishing and equipping rural health centers.
A medical education loan fund to help worthy North Carolina young men and women who pledge themselves to practice in a rural community for four years
The expansion of the two year medical school of the University of North Carolina into a standard four year school
A special study of the medical education of Negroes
The promotion of voluntary or Blue Cross group insurance plans

**Endowment Fund of Ten Million Approved**—March 26 the board of trustees of the Wake Forest College acted favorably on an offer from the Z Smith Reynolds Foundation of an endowment fund with the present market value of $10,500,000 According to the *North Carolina Medical Journal* the charter of the foundation provides that 20 per cent of the income be added to the principal until, through this and other contributions it reaches $50,000,000 The offer stipulated that Wake Forest College be moved to Winston Salem, where the Bowman Gray School of Medicine of Wake Forest College and the North Carolina Baptist Hospital are now located Final decision in the matter will be made by the North Carolina Baptist state convention Officers and directors of the Z Smith Reynolds Foundation are W N Reynolds president Stratton Coyner, secretary, Richard J Reynolds, Mary Reynolds Babcock, Nancy Reynolds Bagley and W R Hubner

## NORTH DAKOTA

**Public Health Meeting**—The third annual meeting of the North Dakota Public Health Association was held in Bismarck, May 28-29 under the presidency of Francis C Lawler, Sc D, Grand Forks Among the speakers were

Dr Gaylord W Anderson Minneapolis Public Health an Expenditure or an Investment.
Dr James F Hanna Fargo North Dakota Physician s Service in Cass County
Mrs Marguerite L. Ingram Fargo, and Carlyle D Onsrud Bismarck The Current Hospital Survey and Hospital Planning in North Dakota
Mr A L Bavone Minot The Environmental Sanitation Program Carried Out in the First District Health Unit
Dr William M Smith Bismarck, The Tuberculosis Control Program in North Dakota
Mr John A Page Grand Forks The Proposed Medical Center—Its Program and Plans

## UTAH

**Medical Activities at Utah**—The radiologic service, which has heretofore been a part of the department of medicine has been given full time departmental status Dr Henry H Lerner formerly a major in the medical corps, Army of the United States, at the Station Hospital, Kearns, has been named professor and head of this department Dr Walter S Loewe of Cornell University Medical College has been appointed research professor of pharmacology Recent research donations to the medical school include

Abbott Laboratories North Chicago Ill $1,500 to Dr Louis S Goodman for continuation of studies on anticonvulsants and $2 000 to the department of pharmacology for research fellowships
John and Mary R Markle Foundation $1,250 to Leo T Samuels Ph D professor of biochemistry for the study of the adjustment of organisms to diet $2,500 to Horace W Davenport Ph.D for studies of intracellular enzymes of the gastric mucosa
Ciba Pharmaceutical Products Inc., $3 000 to the department of pharmacology for research fellowships
Winthrop Chemical Company $1 500 for continuation of its fellowship fund for the years 1946 1947 in the department of pharmacology
Sandoz Chemical Company $1,000 to the department of pharmacology as an unattached grant for research in the field of epilepsy under the direction of Dr Goodman
Committee on Scientific Research American Medical Association, $1,000 to Dr George Sayers Ph D assistant professor of pharmacology for research on pituitary adrenocorticotropic activity

Dr Cecil J Watson, professor of medicine, University of Minnesota Medical School, Minneapolis, delivered the second annual William R. Tyndale Lecture at the school recently on "Clinical Aspects of Hemoglobin Degradation" and "Recent Studies of Hepatitis and Cirrhosis"

## WISCONSIN

**The Helmholz Lecture**—Dr Thomas Francis Jr, Ann Arbor, will deliver the fourth annual A C Helmholz Lecture at the University of Wisconsin Medical School Madison, June 20, on "The Conquest of Influenza." The lectureship was endowed in 1941 by the four children of Mr and Mrs A C Helmholz of Milwaukee

## GENERAL

**Will Braun's Testimonial Open to Every One**—An open invitation is extended to any one wishing to attend the reception and testimonial in honor of Will C Braun at the St Francis Hotel, San Francisco, July 3 In the San Francisco number of THE JOURNAL, page 300 it was erroneously stated that the dinner is being given by Mead Johnson & Company, an inaccuracy arising from the fact that the details of the dinner are being handled by Mr A L Rose of Mead Johnson & Company, Evansville, Ind Mr Rose is acting in behalf of the sponsors of the event, who are Mr Braun's many friends in the profession and in industries serving the medical profession Any one wishing to attend the dinner should write to Mr Rose for complete details

**Medical Memorial Fund**—Establishment of a Medical Memorial Fund to provide financial aid for medical research was announced on May 14 To obtain from $5,000,000 to $10,000 000 a year, it will accept contributions in any amount as memorial gifts Harlow Shapley, Sc D, director of the Harvard College Observatory, is chairman of the board of trustees and in a statement to the press said that the fund will conduct a continuing campaign to raise as much of this sum as possible He explained that gifts to the fund may be made at any time, either immediately after the death of a relative or friend or to honor some one who has died in the past To make a gift the Medical Memorial Fund should be addressed at 630 West 168th Street, New York 32 with the name of the person in whose memory the gift is made and the name and address of the bereaved person to whom the memorial certificate should be sent In addition to Dr Shapley, officers of the Medical Memorial Fund are Henry S Simms, Ph D, president, Drs Russell L Cecil and John M Steele, vice presidents, Marvin R Thompson, Ph D, secretary, and Guy Emerson, treasurer all of New York

**Program in Pharmaceutical Education**—On May 9 the American Council on Education announced that it is undertaking a nationwide survey of pharmaceutical education About $100,000 has been provided by the American Foundation for Pharmaceutical Education to finance the survey under the direction of Edward C Elliott, Ph D., formerly president of Purdue University, with the assistance of a technical staff The plans for the survey include a study of the supply and future demand for trained pharmacists, the practices of the colleges of pharmacy as to the admission, guidance selection and training of students, analysis of present day prescriptions to determine the knowledge required of the professionally trained pharmacist, the relation of pharmaceutical education to business and industry, the role of pharmacy in medical care the qualifications of faculty members and the conditions of faculty service in the colleges of pharmacy, and the relation of the requirements for licenses to the programs of training and practical needs Special attention will be given to methods and means for the training of the scientific specialist now required by the rapidly growing pharmaceutical industries and for pharmaceutical research

**Grants and Fellowships in Cancer Research**—The Committee on Growth of the National Research Council acting for the American Cancer Society, announces that it will entertain applications for grants in cancer research to become effective July 1, 1947 Applications will be received until Sept 15, 1946 Applications for fellowships and senior fellowships in cancer research of the American Cancer Society for the ensuing year will be received until Dec 1, 1946 To date the Committee on Growth has recommended to the American Cancer Society a total of seventy-five research grants and fourteen fellowships The committee will continue to recommend support of research in the basic sciences and in clinical investigative medicine broadly pertaining to problems of growth It will continue also to rely heavily for counsel on its advisory divisions of chemistry, biology, physics and clinical investigations and their subjacent panels in specialized areas of research Applications for research grants for the current year will no longer be entertained Communications should be addressed to the Committee on Growth, Division of Medical Sciences National Research Council 2101 Constitution Avenue, Washington 25, D C

**Radio Series Dedicated to Medical Profession**—Development of wider public understanding and appreciation of the contribution made by the medical profession and by medical research to the world's health and welfare is the objective of a new series of radio programs which was launched over the Columbia Broadcasting System, June 4, at 9 30 p m, Eastern daylight saving time The half hour program known as "Encore Theater," presents radio dramatizations of famous films, novels and biographies dealing with medicine s immortals, as well as with the work, achievements and struggles of thousands of members of the medical profession who, although bypassed by fame, daily are making substantial contributions to the prevention and cure of disease often at great personal sacrifice Sponsor of the program is Schenley Laboratories Inc which for the past two years has sponsored a somewhat similar program dedicated to the medical profession, "The Doctor Fights" The programs are designed to underline the scientific achievements of the medical profession while stressing the human warmth and sympathy which often prompt members of the profession to sacrifice health and even life in order to serve others

**The Third Phase of Medical Care**—A report has been issued by the Baruch Committee on Physical Medicine discussing the need for additional rehabilitation services and centers where the disabled and handicapped can receive post-hospital physical rehabilitation, psychosocial adjustment and vocational guidance and retraining Model community rehabilitation centers discussed in the report would not provide definitive medical treatment but would bridge the gap between the bed and the job by following preventive and curative medicine and surgery with what the committee terms "the third phase of medical care" The model center outlined in the Baruch plan is based on an estimated load of 50 dormitory and 200 outpatients They estimate the average patient stay at two months which would result in a case load of 1,500 patients a year Total program costs for physical therapy, occupational therapy, medical services, vocational testing, guidance and retraining and psychosocial adjustment are estimated at $125 per patient, exclusive of dormitory care and food services Such centers once established the committee believes, would be relatively self supporting as fees would be received from private patients, the Veterans Administration, state rehabilitation programs, industry and insurance companies Copies of the complete report are available from the Baruch Committee on Physical Medicine, Room 3500, 597 Madison Avenue, New York 22

## LATIN AMERICA

**Health Activities in Latin America**—*Personal*—The Legion of Merit was conferred on Col Harold B Gotaas, acting director of the Office of Inter-American Affairs and president of the Institute of Inter American Affairs, at special ceremonies in Washington recently for "exceptional meritorious conduct in the performance of outstanding services in conducting the health and sanitation work of the institute

*Bolivia Establishes National Blood Bank*—The Bolivia National Blood Bank is to be set up in the city of Cochabamba, Bolivia Two Bolivian physicians are in training by the Institute of Inter-American Affairs to take charge of the national plasma project and train other technicians who may be needed

*Chile Opens New Hospitals*—Dr Theodore I Gandy, chief of the six man Institute of Inter-American Affairs medical mission to the South American republic reports that a large modern center of preventive medicine has been completed in the port of Antofagasta and that the 500 bed Trudeau Tuberculosis Hospital in Santiago will be ready for use shortly The United States field party working with Chilean health officials in the Inter-American Cooperative Department of Public Health, helped to plan both of these institutions

*New Minister of Education and Health*—Dr Ernesto de Souza Campos, formerly professor of bacteriology, São Paulo School of Medicine, Brazil, has been appointed minister of education and health of Brazil According to the *News Letter* of the Health and Sanitation Division Institute of Inter-American Affairs the new minister informed Dr Eugene P Campbell, chief of the Institute of Inter-American Affairs field party in Brazil, that no changes are planned in regard to the administration of Servicio Especial de Saude Publica, the cooperative public health program in Brazil, now almost 4 years old

*Sanitation Engineer Honored*—A new modern hospital in the jungle city of Guayamerin will be named for Major Curtis E Richey of Des Moines "as a tribute to the work he performed in our tropical region as a member of the Institute of Inter-American Affairs, and of the Bolivian Servicio Cooperativo Inter-Americano de Salud Publica' Major Richey a former official of the Iowa State Public Health Department went to Bolivia with the Inter-American Affairs medical field party in 1943 He helped to set up small modern hospitals in Guayamerin and Riberalta at the headwaters of the Amazon and directed a campaign against tropical disease in both areas, which were important producers of wild rubber during the early part of the war According to reports published recently in the La Paz press, the health work which Major Richey directed was instrumental in transforming Guayamerin from a malaria ridden small town of a few hundred people into a thriving city about three times its former size Malaria is no longer a problem there, and the general death and morbidity rates are lower in the jungle settlement than they are in towns in "healthful" regions

*Inter-American Medical Congress*—The National Academy of Medicine, Rio de Janeiro, Brazil, will sponsor the first Inter-American Medical Congress, September 7-15 Information may be obtained from Dr A Austregesilo, president of the congress, or Dr Al Cumplido de Sant Anna, general secretary

*First Regional Conference on Sanitary Engineering*—The Pan American Sanitary Bureau in cooperation with the Institute of Inter-American Affairs is planning to inaugurate the first regional conference on sanitary engineering in Latin America This conference is scheduled to be held in Rio de Janeiro, Brazil, the week of June 10 It is planned that sanitary engineers from Argentina, Bolivia, Brazil, Chile, Paraguay Peru, Uruguay and the United States of America will participate in the conference The objectives of the conference are advancement of the profession of sanitary engineering, exchange of scientific data and ideas in the development of sanitary engineering in the Americas, to promote the development of standards for sanitation in regard to international travel, to accelerate the development of sanitation in the Americas to aid in the economic development, to create a better understanding between the engineers of the American republics and to organize a permanent Pan American organization of sanitary engineers

*Congress on Cardiology*—The second Inter-American Congress of Cardiology will be held in Mexico City, October 6-12 at the National Institute of Cardiology, Calzada de la Piedad 300, Mexico, D F, under the auspices of the Inter-American Society of Cardiology, American Heart Association, Argentine Society of Cardiology Cuban Society of Cardiology, Mexican Society of Cardiology, National Institute of Cardiology of Mexico, Ministry of Health of Mexico, Ministry of Foreign Relations of Mexico and the National University of Mexico Additional information may be obtained from Dr Mario Salazar Mallen, general secretary of the congress

## FOREIGN

**Model Medical Centers in China**—Plans to establish model medical centers in China to rebuild the country s medical system were announced by the press on April 23 The program is sponsored by the Chinese government with the cooperation of the American Bureau for Medical Aid to China The first medical centers will be built in Shanghai and places to be designated in North and South China Later units are planned for western and central China

**Effect of War on Russian Health**—The American Society for Russian Relief reports that 40 000 hospitals clinics and other medical institutions were destroyed by the Nazis during their invasion and occupation of the Soviet Union, giving implication for an estimated 15 000,000 war wounded, 4,000 000 children orphaned and war shocked, 1 000,000 youngsters suffering from rickets and other diseases of malnutrition and 1 000,000 amputation cases in which rehabilitation cannot be effected in the immediate future. The statement is released in the society s 1945 program for Russian relief The campaign hopes to obtain $25 000,000 for the purchase of medical supplies and hospital equipment Also as part of its medical campaign Russian relief will undertake to equip a network of hospitals and workshops and an affiliated factory specifically for the treatment of 1 000,000 civilian and military amputees in the Soviet Union Detailed information on this program may be obtained by writing to the American Society for Russian Relief, 5 Cedar Street, New York 5

---

## CORRECTION

**Jaundice Following Yellow Fever Vaccination.**—In the third line of the editorial with this title (THE JOURNAL, May 11), page 142, the words "increase in the" should follow the word "thirty-six-fold." Also the second word in the sentence beginning just below should read 'incubation' instead of "inoculation"

# Deaths

**Robert Wilson** ⊕ Charleston, S C, born in Stateburg, S C Aug 23, 1867, Medical College of the State of South Carolina, Charleston, 1892, joined the faculty of his alma mater in 1893, serving as instructor in bacteriology until 1900, from 1901 to 1903 adjunct professor, later professor of medicine and dean and since 1943 dean emeritus and professor emeritus and special lecturer on medical history chairman of the state board of health from 1907 to 1931, First Vice President of the American Medical Association 1909-1910, president of the South Carolina Medical Association 1904-1905, of which he had been an honorary member the Southern Medical Association, 1915-1916 and the Tri-State Medical Association of the Carolinas and Virginia 1927-1928, member of the American Clinical and Climatological Association, American Heart Association and the National Tuberculosis Association, fellow of the American College of Physicians on the staff of the Roper Hospital, specialist certified by the American Board of Internal Medicine in 1939 the American Legion, department of South Carolina presented him with its plaque for distinguished service to South Carolina received honorary degrees from the University of South Carolina and the University of the South in Sewanee died May 20, aged 78, of coronary thrombosis complicated with pneumonia

**James Watson White** ⊕ New York Albany (N Y) Medical College 1905, born in Dutchess County, N Y, July 3 1876 professor of clinical ophthalmology at the New York Post-Graduate Medical School and Hospital, Columbia University where he was director of the service specialist certified by the American Board of Ophthalmology, member of the American Academy of Ophthalmology and Otolaryngology American Ophthalmological Society, New York Ophthalmological Society and the Association for Research in Ophthalmology fellow of the New York Academy of Medicine formerly associated with the Herman Knapp Memorial Hospital in New York, on the consulting staffs of the Newark (N J) Eye and Ear Infirmary, Brooklyn Eye and Ear Hospital Essex County Contagious Disease Hospital in Belleville N J Roosevelt Hospital in New York and the Mountainside Hospital in Montclair, N J, where he died May 15, aged 69

**Lucius Arthur Wing** ⊕ New York Cornell University Medical College, New York 1907, born in 1882 associate professor of clinical obstetrics and gynecology at his alma mater specialist certified by the American Board of Obstetrics and Gynecology, Inc member of the American Association of Obstetricians Gynecologists and Abdominal Surgeons, fellow of the American College of Surgeons associate attending obstetrician and gynecologist at the New York Hospital, consulting obstetrician to the Margaret Hague Maternity Hospital Jersey City N J and the Nassau Hospital, Mineola N Y, died in Southfield, Mass, February 17, aged 63 of coronary thrombosis

**Edward E Barlow** ⊕ Dermott Ark Memphis (Tenn) Hospital Medical College 1902, born in Laton, Ill, in 1873, member of the House of Delegates of the American Medical Association from 1939 to 1943, past president of the Arkansas Medical Society fellow of the American College of Surgeons past president of the local school board founder of the Barlow Clinic and leader in the building of the Dermott Municipal Hospital first secretary of the Dermott Chamber of Commerce and a charter member and past president of the local Rotary Club, died in the Baptist Hospital Memphis, Tenn, February 6, aged 72 of coronary thrombosis

**Walter De Witt Shelden** ⊕ Rochester, Minn, Rush Medical College, Chicago, 1895, professor emeritus of neurology and psychiatry at the University of Minnesota Graduate School, member of the American Neurological Association, of which he had been vice president, Minnesota Society of Neurology and Psychiatry, Central Neuropsychiatric Association, Osler Medical Historical Society and the Alumni Association of the Mayo Foundation, died February 13, aged 76, of dilatation of the left ventricle and healed rheumatic endocarditis

**John Winston Adams Sr**, ⊕ Chandler, Okla, University of Louisville Medical Department, 1905, served as medical director of the Chandler Sanitarium died February 24, aged 67, of cerebral hemorrhage

**Belle Jane Allen**, Kasauli, India, Boston University School of Medicine, 1904, served as a missionary, died January 24, aged 84

**John Pearl Allen**, Cairo Mo, Barnes Medical College St Louis, 1904, member of the American Medical Association, died February 9, aged 69, of carcinoma

**William Wesley Anderson** ⊕ Fort Thomas, Ky Medical College of Ohio, Cincinnati 1893, born in Weisburg, Ind, Oct. 9, 1866, a major in the medical corps of the U S Army during World War I, fellow of the American College of Physicians, formerly affiliated with U S Veterans Bureau in Cincinnati, died in the Speer s Hospital, Dayton, April 2, aged 79, of anterior coronary occlusion

**Edward Young Anthony**, Omaha Texas (licensed in Texas under the Act of 1903), member of the American Medical Association, for many years secretary of the Morris County Medical Society, member of the Selective Service examining board during World War II, died January 23, aged 75, of uremia

**George Edgar Armour**, St Ignatius Mont, Sioux City (Iowa) College of Medicine, 1905, also a graduate in pharmacy member of the American Medical Association had been affiliated with the Indian Service, died in January, aged 65, of cerebral hemorrhage

**Herbert Burr Bailey** ⊕ Fairmont, Minn University of Minnesota Medical School, Minneapolis, 1913, died in the Community Hospital February 11, aged 62, of coronary thrombosis and hypertensive heart disease

**Louis Andrew Balcke** ⊕ Pekin, Ill, Northwestern University Medical School, Chicago, 1932 entered the medical corps of the U S Naval Reserve on May 10, 1943, served nine months on a small island off Australia later stationed in Bloomington, Ill, where he was an examining physician for the V-12 candidates at Illinois State Normal University, recently released from active duty died in St Louis February 24, aged 41

**James Asher Caldwell** ⊕ Southgate Ky, Medical College of Ohio, Cincinnati, 1901 formerly member of the county board of health staff member and member of the board of trustees of the Speer s Memorial Hospital, Dayton, where he died February 26 aged 74, of cerebral hemorrhage

**Lewis Walter Frank Carpenter**, Reasnor Iowa, Drake University College of Medicine Des Moines, 1904, member of the American Medical Association, died February 24, aged 78, of coronary sclerosis

**Henry Charles**, Brooklyn Medizinische Fakultät der Universität Wien, Vienna Austria, 1921, died in January, aged 56

**Thompson Coberth** ⊕ The Dalles, Ore University of Oregon Medical School, Portland, 1911, fellow of the American College of Surgeons, past president and vice president of the Oregon State Medical Society, formerly member of the state board of health, served in France during World War I, for many years associated with The Dalles Hospital died January 13, aged 57, of dilatation of the heart

**F Homer Curtiss**, Washington, D C, University of Pennsylvania School of Medicine, Philadelphia 1909 died in the Doctors Hospital February 5, aged 70, of cerebral hemorrhage and coronary occlusion

**James David Daniel**, Daniels Landing, Tenn, University of Tennessee College of Medicine Nashville, 1896, also a druggist, died in the General Hospital, Nashville, February 11, aged 77 of massive pulmonary hemorrhage.

**Charles King Dutton**, Moberly, Mo, Marion-Sims College of Medicine St Louis 1895, vice president and director of the City Bank and Trust Company, found dead February 18 aged 75, of heart disease.

**Walter Harmon Dyer** ⊕ Tampa, Fla Atlanta College of Physicians and Surgeons, 1911, died February 9, aged 57, of coronary thrombosis

**Louis Lee Edwards** ⊕ San Marcos, Texas Memphis (Tenn) Hospital Medical College, 1910, fellow of the American College of Surgeons, on the staff of the Soldiers and Sailors' Memorial Hospital, died January 14, aged 64, of coronary thrombosis

**Henry S Fendler**, Santa Monica Calif Baltimore University School of Medicine, 1898 veteran of the Spanish-American War died January 7, aged 72

**James Watkins Fennell**, Missoula, Mont., University of Nashville Medical Department, 1907, member of the American Medical Association, served with a Johns Hopkins unit in World War I, affiliated with the Northern Pacific Beneficial Association Hospital, died February 23, aged 60, of virus pneumonia

**Harry L Fiscus**, Reinersville, Ohio, Baltimore University School of Medicine, 1897, served as county coroner and on the staff of Marietta (Ohio) Hospital, died January 6, aged 75, of coronary thrombosis

**William Ernest Floyd**, Holdenville, Okla., Vanderbilt University School of Medicine, Nashville, Tenn, 1903, member of the American Medical Association, county superintendent of public health, died near Lincoln, Ark., January 22, aged 65, of virus pneumonia

**William Henry Gilbert** ⊕ Los Angeles Bellevue Hospital Medical College, New York 1889, an Affiliate Fellow of the American Medical Association, fellow of the American College of Surgeons, served during World War I, died in the Veterans Administration Facility Sawtelle, February 3, aged 78, of arteriosclerotic heart disease

**Enea Augusto Gius** ⊕ San Francisco, Regia Universita degli Studi di Firenze Facolta di Medicina e Chirurgia, Italy, 1921 member of the hospital corps of the Italian army during World War I, served as clinical instructor in pediatrics at the University of California Medical School, died January 5, aged 52, of acute bronchial obstruction and pulmonary atelectasis

**John Henry Goebel**, Racine, Wis , Wisconsin College of Physicians and Surgeons, Milwaukee, 1909, on the staff of St. Lukes Hospital died February 1, aged 62, of lobar pneumonia and chronic nephritis

**Martin Luther Golberg**, Minneapolis Minneapolis College of Physicians and Surgeons 1901, member of the American Medical Association, died February 26, aged 69, of coronary thrombosis

**Harry Templar Guss**, St. Petersburg, Fla., Jefferson Medical College of Philadelphia, 1886 formerly employed in the insurance medical section of the U S Veterans Bureau, died January 19, aged 86

**Morris H Herzman** ⊕ Chicago, Jenner Medical College, Chicago 1898 died February 4, aged 78, of coronary thrombosis

**George Yerger Hicks**, Dallas Texas Tulane University of Louisiana School of Medicine, New Orleans, 1932, interned at the Southern Baptist Hospital in New Orleans, served a residency at the Mississippi State Charity Hospital, Vicksburg, Miss , served in the medical corps, Army of the United States, during World War II formerly associated with the city health department died in a local hospital January 11, aged 39, of gastric hemorrhage.

**Albertus Tribue Hoxie**, Dearborn Mich , University of Michigan Homeopathic Medical School, Ann Arbor, 1901, died in the Wayne County General Hospital, Eloise, February 8, aged 85, of arteriosclerosis

**John Rogers Hudson**, St. Louis, College of Physicians and Surgeons of Chicago, 1896 served during the Spanish-American War, died January 3 aged 89

**Frank Orville Hunt**, Fall River, Wis Bennett College of Eclectic Medicine and Surgery Chicago 1890 member of the American Medical Association, served as health officer of Fall River, died February 8, aged 78, of coronary thrombosis

**Fayette Lane Inslee** ⊕ Le Raysville, Pa., Medico-Chirurgical College of Philadelphia, 1898, past president of the Bradford County Medical Society, examining physician for the draft board during World War I, for many years school director and physician for the board of health, died February 8, aged 74, of angina pectoris

**George Wiley King**, Atlanta Ga., University of the South Medical Department, Sewanee, Tenn., 1896, died January 12, aged 73, of cardiovascular renal disease

**Arthur Lewis Loebel**, New Orleans Chicago Medical School, 1945 assistant surgeon U S Public Health Service, Reserve, died January 12, aged 28

**Charles Hodge Lyon** ⊕ Phillipsburg, N J University of Pennsylvania Department of Medicine, Philadelphia, 1898, formerly a medical missionary served during World War I, for many years designated medical examiner for Phillipsburg for the Veterans Administration on the staff of the Warren Hospital, died April 19, aged 72, of carcinoma of the liver

**William Tarlton McCurdy**, Stone Mountain, Ga., Atlanta Medical College, 1897, died February 13, aged 70, of myocardial heart disease.

**Jesse H Martin**, Selma, Ala Mississippi Medical College, Meridian 1909, Memphis (Tenn.) Hospital Medical College, 1910 member of the American Medical Association, died January 31, aged 64

**Clarence Warren Mehlhop**, Washington, D C , University of Michigan Department of Medicine and Surgery, Ann Arbor, 1899, served during World War I, for many years affiliated with Veterans Administration, died in the U S Naval Hospital, Bethesda, Md, January 19, aged 73

**Wendell Holmes Montgomery** ⊕ Louisville, Ohio, University of Pittsburgh School of Medicine, 1921, served during World War I, died January 20, aged 53

**Francis Joseph Mulligan**, Newton, Mass , Boston University School of Medicine 1928, member of the American Medical Association, examining physician for the city health department, on the courtesy staff of the Waltham (Mass ) Hospital, on the staffs of Newton-Wellesley Hospital in Newton and St Elizabeth's Hospital in Boston, where he died February 5, aged 44, of rheumatic heart disease.

**Pirl B Myers** ⊕ El Reno, Okla , National University of Arts and Sciences Medical Department, St. Louis, 1912, died March 24, aged 57, of coronary occlusion

**Leo Lewis Newfield**, Los Angeles, University of Michigan Medical School, Ann Arbor, 1921, died January 3, aged 51

**Elmer Ree Newland** ⊕ Drakesville, Iowa, Keokuk Medical College, College of Physicians and Surgeons, 1904, died February 6, aged 66, of coronary thrombosis

**Charles Hannibal Nims** ⊕ Hot Springs National Park Ark., University of Michigan Department of Medicine and Surgery, Ann Arbor, 1897 member of the Radiological Society of North America, Inc served during World War I, died February 6, aged 75, of paralysis agitans with progressive degenerative myocarditis

**George Henry Noble**, St Augustine, Fla. Columbia University College of Physicians and Surgeons, New York 1917, died February 11 aged 55, of coronary thrombosis

**Richard Smith Pickler** ⊕ Beloit, Kan., John A. Creighton Medical College Omaha, 1912, served in France during World War I, died February 23, aged 61, of heart disease.

**Frederick James Port** ⊕ Peoria, Ill College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois 1912, past president of the Christian County Medical Society, formerly surgeon for the Peabody Coal Company in Taylorville, died February 15, aged 59, of coronary thrombosis

**Samuel P Radin** ⊕ Aliquippa, Pa., Western Pennsylvania Medical College, Pittsburgh, 1906, died February 11, aged 64, of coronary thrombosis

**Charles Clay Reed Sr**, ⊕ Little Rock, Ark. University of Arkansas School of Medicine, Little Rock, 1906, on the staffs of the Baptist State Hospital and St. Vincent s Infirmary, where he died February 16, aged 71 of coronary occlusion

**Joseph Loram Reed**, Wilmot, Ohio Ohio Medical University, Columbus, 1897, died January 17, aged 78

**Charles Washington Reid**, Pelham, Ga. Atlanta Medical College, 1882, member of the American Medical Association, served as president and secretary of the Mitchell County Medical Society, charter member of the local board of education, died January 1, aged 87

**William Gifford Rice**, Cheboygan Mich University of Michigan Department of Medicine and Surgery, Ann Arbor, 1891, served on the staff of the Little Traverse Hospital in Petoskey died February 4, aged 76, of coronary occlusion

**Edgar T Riley**, Frenchburg, Ky , University of Louisville Medical Department, 1896, member of the American Medical Association, health officer of Menifee County for many years, died February 15 at Elkton, aged 71, of cerebral hemorrhage

**Herman Call Runyan**, Alexandria, Ind., Rush Medical College, Chicago, 1906 member of the American Medical Association, served during World War I, health officer, died January 8 aged 68, of acute circulatory collapse

**James H Sanderson**, Detroit Michigan College of Medicine and Surgery, Detroit, 1890, member of the American Medical Association formerly secretary of the Wayne County Medical Society, died January 30, aged 84, of carcinoma

**Bernard Schloasmann** ⊕ Milwaukee Rush Medical College Chicago, 1919 died in the Mount Sinai Hospital January 27, aged 53 of carcinoma of the rectum.

**Irvin William Sherwood**, Columbus, Ohio, Starling Medical College, Columbus, 1901 member of the American Medical Association, died December 31, aged 76

**George Francis Shiley** ⊕ Seattle, State University of Iowa College of Medicine, Iowa City, 1903, for many years affiliated with the city health department, died in February, aged 69, of pneumonia.

**James Rex Sholl,** St Petersburg, Fla , Chicago Homeopathic Medical College 1904, also a D D S , served during World War I , at one time health officer of Peoria, Ill , died February 21, aged 65, of carcinoma of the cecum

**Charles Sherman Smith,** Clarkesville, Ga , University of the City of New York Medical Department, New York, 1892, member of the American Medical Association and the Rhode Island Medical Society, died February 11, aged 82, of organic heart disease.

**Albert L Smither,** Chaplin, Ky , University of Louisville (Ky ) Medical Department, 1888, died February 25, aged 84, of injuries received in an automobile accident

**A H Sorrelle,** Brownsville, Tenn , Memphis Hospital Medical College, 1907, member of the American Medical Association, died January 10, aged 64

**Lester James Spinharney,** Cherokee, Iowa, Creighton University School of Medicine, Omaha, 1923, member of the American Medical Association, served as city health officer, died February 14, aged 46, of coronary thrombosis

**Robert Sponner,** Milwaukee, Medizinische Fakultät der Universität Wein Vienna, Austria, 1904, member of the American Medical Association, died in Tucson, Ariz, February 3, aged 66, of arteriosclerotic heart disease.

**Harry Frank Stamos** ⊕ Detroit, University of Michigan Medical School, Ann Arbor, 1929, interned at St. Joseph's Mercy Hospital, where he was staff consultant, began active duty as lieutenant commander in the medical corps of the U S Naval Reserve, April 1, 1942, retired June 29, 1943, died December 12, aged 42

**Edmund Arthur Steenburg** ⊕ Aurora, Neb Rush Medical College, Chicago, 1887 served as president of the Hamilton County Medical Society, died February 1, aged 80, of pulmonary embolism

**Frank Stockman,** New York, Long Island College Hospital, Brooklyn, 1905, died January 7, aged 68, of carcinoma of the stomach

**Charles Wright Stoughton,** Westerville, Ohio, Ohio Medical University, Columbus, 1901, died February 23, aged 72, of diabetes mellitus

**Charles Clifton Stroup,** Bloomington, Ind , Rush Medical College, Chicago 1900 for many years school physician, died February 14, aged 74, of arterial hypertension.

**Longin Tabenski** ⊕ Chicago, Chicago College of Medicine and Surgery, 1914, served during World War I , member of the staff of St. Mary of Nazareth Hospital, died in the Veterans Administration Facility, Hines, February 15, aged 59, of coronary heart disease.

**Oliver P Templeton,** Fairfax, Mo Physio-Medical Institute, Cincinnati, 1878, also a druggist, died in the Missouri Methodist Hospital, St. Joseph, February 2, aged 91, of uremia

**Michael H Thielen,** Grundy Center, Iowa, State University of Iowa College of Medicine, Iowa City, 1898, member of the American Medical Association, died in St Francis Hospital, Waterloo, February 24, aged 79, of pneumonia and uremia

**William C Thompson,** Waterloo, S C., Chattanooga Medical College, 1900, died December 19, aged 71

**John William Tinder,** Detroit, Medical College of Indiana, Indianapolis, 1892, served during World War I , died February 5, aged 81, of cerebral hemorrhage.

**William Marshall Trowbridge** ⊕ Viroqua, Wis , Chicago Homeopathic Medical College, 1893, member of the board of pension examiners for Vernon County, died in Rochester Minn , January 23, aged 79, of pneumonia

**Eldridge Curts Turner,** Sacramento, Calif , University of California Medical Department, San Francisco, 1905, member of the American Medical Association, on the staff of the Mercy Hospital, where he died February 9, aged 62, of heart disease.

**Wilson Lewis Vickers** ⊕ Franklin, Ky Vanderbilt University School of Medicine Nashville, 1915 owner of the Vickers Hospital, where he died February 13, aged 61, of bronchopneumonia

**Frederick Symonds Wakefield,** Lewiston, Maine, Columbia University College of Physicians and Surgeons, New York 1899, member of the American Medical Association, ophthalmic surgeon emeritus at the Central Maine General Hospital, where he died January 20 aged 72, of chronic uremia, bilateral hydronephrosis due to chronic urinary retention and prostatic hypertrophy

**Wiley H Ward,** Cumby, Texas (licensed in Texas under the Act of 1907) died February 13, aged 79, of coronary heart disease

**Charles Thomas Way** ⊕ Cleveland, Western Reserve University School of Medicine, Cleveland, 1921, assistant clinical professor of medicine at his alma mater specialist certified by the American Board of Internal Medicine, fellow of the American College of Physicians, past president of the Academy of Medicine of Cleveland, on the staff of St Luke s Hospital, died in the University Hospitals February 4, aged 58 of bronchopneumonia and cardiovascular renal disease.

**Henry Emerson Wetherill,** Audubon, Pa., University of Pennsylvania Department of Medicine, Philadelphia, 1893, died March 4, aged 74, of heart disease.

**Carl C White,** Mathews, Va , Baltimore Medical College, 1897, secretary of the county board of health, died February 3, aged 77, from a fracture of the hip incurred in a fall

**James D Whittaker,** Cannel City, Ky , Kentucky School of Medicine, Louisville, 1894, member of the American Medical Association, formerly state senator, died January 23, aged 74, of arteriosclerotic heart disease.

**Ozion Price Wilson,** Moundsville, W Va , Kentucky University Medical Department, Louisville, 1904, member of the American Medical Association, member of the staff of the Reynolds Memorial Hospital in Glen Dale, for many years physician for the West Virginia Penitentiary, died February 16, aged 68, of coronary thrombosis and hypertensive heart disease

**Alfred Millard Wose** ⊕ Syracuse, N Y , Harvard Medical School, Boston, 1901, assistant professor of clinical surgery (urology) at the Syracuse University College of Medicine, member of the American Urological Association and the Syracuse Academy of Medicine, on the staffs of St Joseph's and Syracuse Memorial hospitals, died February 13, aged 69, of coronary occlusion

**H Sanford Yost,** Fairmont, W Va Indiana Eclectic Medical College, Indianapolis, 1890, died February 17, aged 77, of cerebral hemorrhage.

## PUBLIC HEALTH SERVICE

**Carl Michel** ⊕ Rear Admiral Assistant Surgeon General, U S Public Health Service, Washington, D C , College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1912, born in Chicago May 4, 1890, following his internship in the U S Marine Hospital in Chicago was detailed to assist the Indiana State Board of Health during the floods of 1913 appointed an instructor in bacteriology at his alma mater, later detailed work on plague eradication measures in New Orleans and studied the etiology of pellagra at Rankin State Farm Mississippi, later assigned at Ellis Island N Y , on declaration of World War I was temporarily transferred from the public health service to assignment as medical officer in the Coast Guard, this duty terminated in February 1918, when he was attached to the hospital division of the public health service, Washington, D C , in 1921, at the request of the Mexican government, he was ordered to Tampico, Mexico to institute control measures in an outbreak of bubonic plague, an outbreak of plague in Los Angeles in July 1925 resulted in duty at that city, to be followed by another detail at Seattle, in August 1927 was transferred to Arkansas for flood relief work and the organization of twenty-three county health units during an assignment to Miami, Fla in the summer of 1930, organized a standard airplane quarantine system and was first to call attention to the fact that airplanes may carry mosquitoes, bringing such diseases as yellow fever and was instrumental in establishing a system of inspection of airplanes to eliminate this danger in 1932 in conjunction with Pan American Airways, designed plans for airplane quarantine stations which were incorporated into a new airplane terminal at Miami, after five years as chief medical officer of the U S Coast Guard Academy at New London Conn, reported to Coast Guard headquarters in July 1940 for duty as chief medical officer, since that time the medical division has expanded to many times its former size and much progress has been made under his direction in relation to constructing additional medical and dental facilities for the wartime personnel of this branch of the service, in November 1943 became assistant surgeon general with the rank of rear admiral, died in the U S Naval Hospital Bethesda, Md, January 3 aged 55, of cerebral hemorrhage.

### Second Reading of National Health Service Bill

The minister of health, Mr Aneurin Bevan has at last published his proposals for a national health service In moving the second reading of the bill in the House of Commons he said that the first reason why a health scheme was necessary was that all parties agreed that money ought not to stand in the way of obtaining an efficient health service The national health insurance system already provided a general practitioner service for 21 million, but the rest of the people had to pay whenever they desired the services of a doctor A person ought not to be financially deterred from seeking medical assistance at the earliest stage. One of the evils of having to buy medical advice was anxiety about doctors bills In an overwhelming number of cases the services of specialists were not available to poor people Further, our hospital organization had grown up with no plan or system It was unevenly distributed over the country, and often the best hospital facilities were available where least needed Many hospitals were much too small About 70 per cent had fewer than 100 beds and over 30 per cent fewer than 30 To be efficient a hospital must provide specialist services which small hospitals could not In other respects the health of the people was not properly looked after Their teeth were a reproach, and there was a woful shortage of dentists Only 25 per cent of the people could get their eyes tested and obtain spectacles Sufficient attention had not been paid to deafness and the provision of cheap hearing aids

One of the first merits of the bill was that it provided a universal health service and was intended to universalize the best health advice and treatment The three main instruments were the hospitals general practitioners and health centers The hospitals in many ways were the vertebrae of the health system, but it was repugnant that they should have to rely on private charity In the future 80 to 90 per cent of the revenue of the voluntary hospitals would be provided by public funds, and they could no longer be called voluntary His decision that the voluntary system must go had given rise to considerable resentment. How could the voluntary hospitals be articulated with the municipal ones? The only course was to create an entirely new hospital service to take over both By grouping the hospitals round the medical schools they would provide what was badly needed—means by which the general practitioner would be kept in more intimate association with new medical thought, practice and training One of the shortcomings of the existing medical service was the intellectual isolation of the general practitioner in many areas The appropriate hospital unit was 1 000 beds Specialist service could be provided only with a grouping of that size The hospitals would be administered by regional boards drawn from members of the medical profession, major public health authorities in the area, medical schools and those experienced in voluntary hospital administrations

As to the general practitioner service, his proposal was that general practitioners should not be in direct contact with the Ministry of Health but in contact with new bodies, on which doctors dentists and pharmacists would have half representation The whole scheme would give a greater degree of medical representation than ever before. It would strengthen democracy by giving doctors full participation in the administration of their own profession. They would not become civil servants Regarding the distribution of doctors, he regarded the present condition as most harmful to the health of the people. He gave figures showing a variation in different towns from one doctor to 4,100 persons to one to 1,200 If the country was to get doctors where they were most needed, it could not allow a doctor to go to a particular area because he had bought a practice He always regarded the sale of medical practices as an evil, it was tantamount to the sale of patients With regard to remuneration, the profession was not ripe for a fully salaried service There must be some reward for zeal He therefore proposed that capitation should remain the main source of income, but there would be a basic salary

Health centers would vary in size There would be larger ones with dental clinics, maternity and welfare services and general practitioner consultative facilities, and smaller ones where the practitioner could see his patients

#### OPPOSITION TO THE BILL

Mr Willink, minister of health in the coalition government, moved an amendment "That this House, while wishing to establish a comprehensive health service, declines to give second reading to a bill which prejudices the patient's right to an independent family doctor, which retards the development of hospital services by destroying local ownership and gravely menaces all charitable foundations by diverting to purposes other than those intended by the donors the trust funds of the voluntary hospitals and which weakens the responsibility of the local authorities without planning the health service as a whole" Mr Willink said that the opposition totally disagreed with the intention of the labor party to organize the medical profession as a national full time, salaried pensionable service The bill would enable this to be accomplished in time. This view is confirmed by a reply made later in the debate by Mr Bevan When challenged on the point he said "There is all the difference in the world between plucking fruit when it is ripe and plucking it when it is green" Another argument used against the bill was opposition of the great majority of the medical profession and of the three Royal Colleges of Physicians, Surgeons and Obstetrics and Gynecology After a protracted debate extending over three days the opposition amendment was negative by 359 votes to 172, and the bill was read a second time

### Thirty-Six Days of Starvation in the Open Sea

An interesting case of prolonged starvation was recently reported in the *Naval Military Surgeon* by Capt. P Yeressko Jr of the Naval Medical Corps of the Black Sea Captain Yeressko left the Crimea in July 1942 when the Nazi troops invaded the peninsula, in a small boat with three comrades, they had only one small flask of fresh water and three cans of preserved fish for food The crew rowed in turn during the first three days, but rowing soon became impossible They decided to lie quietly without moving or speaking The feeling of hunger was very strong for the first week, but later it diminished, nevertheless, the thoughts of the crew were continually about eating By the end of the third day all fresh water was gone Captain Yeressko proposed that they drink sea water, to which all four men gradually became accustomed By chance it was noticed that tablets for chlorinating water gave it a somewhat better taste Later the four men became so accustomed to sea water that on the fifth day all could drink about a quart and a half daily However, when it was possible the crew enthusiastically drank rain water

During the first fifteen days there was a keen feeling of starvation backache, ache in the muscles of feet, fatigue, shortening of work capacity, reduction of weight, decrease of the pulse rate *(about 56 per minute)*, decreased sweating, and dryness of the skin These symptoms became more intense after the fifteenth day, and nervous and psychic symptoms such

as hallucinations and loss of consciousness were added The first member of the crew died on the nineteenth day, the second on the twenty-fourth day and the third on the thirtieth day of starvation Captain Yeressko was rescued unconscious by a passing ship on the thirty-sixth day of starvation He lost 22 Kg during those five weeks On the seventh day after rescue, when eating meat for the first time instead of the usual tea, gastric distress with diarrhea developed and was controlled only after treatment with hydrochloric acid and pepsin

Although more than two years have passed Captain Yeressko notes that fresh water and ordinary food still taste undersalted

### The Death of Alexis Zavarzin

Prof Alexis Zavarzin died on July 25, 1945 after a disease of long duration He received his scientific education from the Russian histologist A Dogel and soon became a brilliant research worker In 1914 he became a privatdozent in the University of St Petersburg, and in 1916 he was elected professor at the University of Perm In 1922 he assumed the chair of histology and embryology in the Military Medical Academy and later in the Naval Medical Academy He was one of the founders of the All-Union Institute of Experimental Medicine, where he headed the anatomy department until his death Zavarzin's principal work, 'Essays on Evolutional Histology of the Nervous System," is considered the best monograph of Soviet scientific literature He received for this work the Stalin Award In 1943 he was elected a member of the Soviet Academy of Sciences He did not cease work during the war and though evacuated to Tomsk in Siberia began to write a monograph on the evolution of the connective tissue He published more than a hundred scientific works

### BCG Vaccination in Denmark

Much work on BCG vaccination against tuberculosis was carried out in different parts of Denmark during the war, and if it had not been for the inhibitory influence of the German occupation and the engrossing interest of diphtheria immunization BCG vaccination would have been carried out on a nationwide scale. Even so, the experience gained during the war has proved far reaching and instructive. There are two main reasons why this measure has gained so much ground of late The first concerns its intrinsic merits The second hinges on the fact that it has been sponsored by the State Serum Institute and other influential bodies representing the most expert talent in the country In December 1945 the public health authorities conferred with the Danish National Association against Tuberculosis with a view to calling a representative conference early in 1946 When it was held in February of this year its members included a representative cross section of the Danish medical profession One of the reports presented to this conference dealt with the experiences of all the tuberculosis dispensaries in the country This report showed that BCG vaccination was carried out so systematically among tuberculin negative school children between 1940 and 1945 that in another two years all school children between the ages of 10 and 14 requiring such immunization will have undergone it

### New Maternity Welfare Legislation

For some years before the second world war Danish medical practitioners had united in a voluntary system of maternity welfare with special reference to prophylactic measures during pregnancy This movement was outside the scope of the health insurance societies which were pledged to therapeutic but not to prophylactic activities on behalf of expectant mothers The movement has now been changed from an unofficial and voluntary basis to an official footing by the adoption of the Pregnancy Hygiene Law on Oct 1, 1945 by the Rigsdag This law came into force in December last year and provides for three prophylactic medical examinations by a doctor and up to seven examinations by a midwife for every pregnant woman requesting such examination free of charge The state, not the health insurance societies, defrays the expenses of this measure, the adoption of which so soon after the end of the war was hastened by the great increase of syphilis during the war After discussions with the Danish Medical Association and the Danish Association of Midwives, the government fixed the remuneration for doctors at 10 kroner for the first examination, 5 kroner for each of the two following examinations and 3 kroner for each examination by a midwife The medical examination includes a Wassermann test at the State Serum Institute free of charge There is not any fee for medical examination if pregnancy is not demonstrable The first medical examination is to be made at the beginning of pregnancy and is to include the Wassermann test The second examination should be about the middle of pregnancy and the third examination about six weeks before confinement is expected The framers of this law have been careful to invoke the aid of the general practitioner rather than that of a selected group of specialists in this scheme This will maintain the interest of general practitioners in the movement and they will be encouraged more than ever to link preventive with therapeutic measures

### Diphtheria Immunization in Copenhagen

The work of the State Serum Institute and of the Blegdam Fever Hospital serving Copenhagen has recently been correlated and studied by Dr J Ipsen He has investigated the diphtheria immunity of the adult population of Copenhagen and has found that persons who had contracted diphtheria more than fifteen years earlier did not possess more antitoxin than those who had never contracted this disease One of the most remarkable findings is the shift of the age incidence of diphtheria in recent years Until 1941 the ratio of child to adult cases of diphtheria was 5 to 1 In 1941 the voluntary vaccination of children in Copenhagen against diphtheria became general, and when the last wave of diphtheria began in 1943 the ratio of child to adult cases was 1 to 1 8 and in 1944 it was 1 to 2 2 In the same year more than 90 per cent of all the children in Copenhagen between the ages of 4 and 15 had been vaccinated This shifting of the age incidence of diphtheria has been accompanied with a greatly increased mortality rate, which in 1943 and 1944 was between 8 and 9 per cent, as compared with 2 to 4 per cent earlier Dr Ipsen suggests that this change must be attributed to the sudden appearance in 1943 of the "gravis type." His investigation of the antitoxin content of the blood in vaccinated persons is all the more valuable because the same technic and the same vaccine are employed everywhere in Denmark The interval between the first and second injections is one month and between the last two injections is one year Dr Ipsen concludes from his investigations that "the Danish vaccine has stood the test of a serious epidemic"

## Marriages

James L. Fender, Bamberg, S C, to Miss Betty Petty of Belleville, Ill, in St Louis, March 23

James K Cunningham, Newark, Ohio, to Miss Ann Loren Wilson at Camp Lejeune, March 30

Reid Hogan Anderson, Pullman, Wash, to Miss Uva Louise Teiser of Henderson N C, April 22

Stanton L. Collins, Fort George Mead, Md., to Miss Anne Keith of Columbia, S C April 7

John C Hanley to Miss Ruth Grey Argersinger, both of Lewistown, Mont., April 27

Gayle G Arnold to Miss Elizabeth Key Boyle, both of Baltimore, Nov 17, 1945

## THE CASE HISTORIES OF DOCTORS' ILLNESSES

*To the Editor* —I intend to publish in book form a collection of subjective case histories written by physicians, if a sufficient number of suitable contributions can be obtained

The response of patients to disease is essentially second hand knowledge, since it is by necessity based on information provided by patients Since the development of ever wider and more refined methods for the objective evaluation of morbid conditions, the information that only the patient can give has more and more been relegated to the background This tendency is enhanced by the much greater variety of individual symptoms than that of objective signs Apparently uncontrolled variables (namely, the patients' response) are obviously less valuable in diagnosis and prognosis than are objective, recordable and preferably measurable signs and laboratory findings Within limitations this tendency is scientifically sound and fertile. However, it needs to be complemented by a fuller knowledge of patients subjective experience of disease This refers to a much broader field than what is customarily called symptoms Parenthetically it may be noted that the understanding, analysis and treatment of symptoms per se tend to be neglected in modern scientific medicine. Such neglect deprives the physician of most valuable diagnostic hints and the patient of relief that he may justifiedly expect. The physician who has had no intimate subjective experience with disease is apt to underrate greatly the patient's overwhelming interest in symptoms, falsely assuming that the patient always shares with him his dominating interest in diagnosis

The full significance of the argument will be understood only if the term "symptoms" is used to mean the total subjective experience of the patient caused by disease. To the commonly acknowledged symptoms, such as pain, fatigue and nausea must be added such subjective experiences as are related to the mental, emotional, social and economic aspects Any subjective experience proceeds not in a theoretical vacuum of the "normal' or 'average" person but within the canvass of an established personality with all its modalities of intellect, emotions, faith, codes of behavior and social and economic realities The argument may then well be encompassed in two main questions

1 How has my personality (in the fullest sense of the word) *modified* the disease?

2. How has the disease modified my personality?

A fertile approach to this problem is to induce physicians to analyze and describe their own experience with diseases they have or have had The combination of objective medical knowledge with the subjective experience should be particularly fruitful of original contributions in this field While many subjective case histories could be and have been culled from autobiographies and from case reports, the present purpose has been advanced by only a small percentage of them, mainly because most of them were not written with the specific aim in mind.

I contemplate, therefore, publishing a collection of subjective clinical descriptions, written by physicians who have, or have had, certain diseases In such a collection, emphasis should be placed on chronic or recurrent diseases, because they are likely to show, more than acute ones, modifications caused by the patients' individuality and more of such significant marks as disease may leave on the individual in his mental, emotional, physical, social and professional life.

Each contributor should be limited by no other concern than the general aim of the collection It is therefore expected that objective clinical details be limited to that minimum which is germane to the story Full emphasis should be given to subjective symptoms, especially to those that the usual textbooks consider unessential or fail to mention Considerable details are expected in the matter of psychologic attitude to the disease as such, to pain, to the prognosis—right or wrong—to the limitations imposed by the disease or its consequences, to accomplished or attempted readjustments, and to peculiarities of the premorbid personality if it is essential to the total picture.

I am aware of the inherent difficulties and pitfalls In many discussions the main and first objection raised was the impossibility of getting "unbiased accounts" This is simply met by the answer that unbiased accounts are neither expected nor desired, since it is precisely the individual experience that should be told There will presumably be the contributor with exhibitionistic tendency, and the stoic on the other extreme Proper editorial selection, it is hoped, will provide balance and the desired variety

Each contributor will have the choice whether or not he wishes to remain anonymous, and, if anonymity is desired, it will be strictly maintained

Physicians who may be interested in contributing reports of their illnesses are invited to write to

MAX PINNER, M D, Editor,
American Review of Tuberculosis,

## QUININE AS PROVOCATIVE TEST IN MALARIA

*To the Editor* —The remarks by Commander Fred A Butler in the January 5 issue of THE JOURNAL deserve a little additional comment He states that 'the use of quinine as a provocative measure has not to my knowledge, ever been reported before and requires confirmation" My own experience at a Southwest Pacific naval hospital revealed several cases in which the thick blood smear showed malarial parasites for the first time after the administration of 1 Gm of quinine. That this experience was not unique is indicated by the statement on page 90 of Stitt's Diagnosis, Prevention and Treatment of Tropical Diseases (ed 6) 'Provocative measures to produce a relapse with a reinvasion of the blood by malarial parasites are occasionally employed for diagnostic purposes Among these may be mentioned fatigue, refrigeration, exposure to sunlight, administration of small doses of quinine for ten to fourteen days "

BERNARD M JACOBSON M D, Boston

## "PHYSIATRIST" FOR PHYSICIAN SPECIALIZING IN PHYSICAL MEDICINE

*To the Editor* —An editorial comment in THE JOURNAL, May 4, suggests the term "physiatrist" for physicians who specialize in physical medicine. Many lay folk now have difficulty determining the spelling and significance of the words psychiatry, psychiatrist and psychologist. "Physiatrist" will further confuse. Psychiatrists will be answering calls from patients seeking physiatrists Physiatrists will be embarrassed by unwelcome maniacal and paranoid guests "Physiatrician," the second of three terms suggested, is discriminated better That he is a physician rather than a lay healer is denoted by the last syllable of this term.

Please publish my protest to the term "Physiatrist."

RUSSELL G MACROBERT,
Neuropsychiatrist,
Captain, MC (S), USNR.

## MEDICOLEGAL ABSTRACTS

**Prepayment Medical and Surgical Plans Limitations, Good Faith of Physician Member**—The plaintiff sued King County Medical Service Corporation to recover for the surgical expense of having a "stomach ulcer removed by a physician member of the defendant organization From a judgment in favor of the plaintiff, the defendant appealed to the Supreme Court of Washington

The King County Medical Service Corporation, a charitable organization founded some years ago by a large number of physicians and surgeons in Seattle, Washington, entered into a contract with the Seattle-Tacoma Shipbuilding Corporation plaintiff's employer, to furnish certain surgical and medical services to its employees, among which were the following

Services (a) All surgical services reasonably required for any operation and/or for any accidental bodily injury to the patient for a period not to exceed twenty six (26) weeks.

(b) All medical services reasonably required for the treatment of any disease and/or any sickness and/or any accidental bodily injury to the patient for a period of not to exceed Twenty six (26) weeks

The contract also provided

8 The medical director of the company who is hereinafter referred to as the 'medical director or any physician whom he may designate shall have the exclusive and absolute right to determine whether any patient is entitled to treatment, and if so to what treatment, and any such determination made in good faith shall be deemed and held to be conclusive and binding upon the company the patient his heirs executors administrators and dependents and upon the employer if the employer be interested and upon those offering said services

Terms Limitations and Exclusions The physician shall not be required to treat

3 Any preexisting sickness injury or physical disability whether patent or latent and their complications and sequelae from which the patient may be suffering or which may originate or exist prior to the commencement of his relationship with the company and the medical director or a physician whom he may designate shall in line with the authority conferred upon him in paragraph 8 of the agreement have the exclusive and absolute right to determine the question whether or not any such condition originated or existed prior to the commencement of the relationship between the patient and the company and further, that any such determination made in good faith shall be deemed and held to be conclusive and binding upon the patient his heirs executors administrators and dependents and upon his employer if any there be interested and upon the company and upon the physician

The plaintiff, as an employee of the Seattle-Tacoma Shipbuilding Corporation, became a contributor in 1942 and thus became entitled to the privileges of the contract existing between his employer and the defendant, King County Medical Service Corporation At 11 p m on Aug 23, 1942 the plaintiff became violently ill Dr Hagyard a member of the defendant organization, was called and determined that an operation should be performed at once Plaintiff was rushed to the hospital where Dr Hagyard operated and found a perforation of the bowel, the perforation being right in the center of a hard mass which the doctor discovered to be an ulcer Because the immediate condition of the patient did not permit the removal of the ulcer at that time, Dr Hagyard closed the perforation by covering it with layers of fat so that food and fecal matter would not escape into the abdominal cavity Both before and after the plaintiff had left the hospital he was informed that he still had a "stomach ulcer" The physician did not recommend the surgical removal of this ulcer, however, but suggested that medical treatment be tried first and accordingly prescribed a specific diet for the plaintiff to follow The medical treatment was unsuccessful, however, and in September of 1943 Dr Hagyard performed another operation on the plaintiff and at that time removed a "stomach ulcer" The defendant paid all the expenses of the first operation but refused to pay for the second operation

The question presented was whether the defendant corporation, under its contract, was bound to pay the expenses of the second operation The plaintiff argued that Dr Hagyard and the defendant purposely "attempted to avoid any liability for considerable expense by putting the plaintiff off, week after week, and not performing the operation which was necessary to effect a cure, putting him off until twenty-six weeks had expired" We have made a careful study of the statement of facts, said the Supreme Court, but cannot find any evidence to support the plaintiff's contention At one time during the trial the plaintiff was asked how long it was after the operation before he was ready to have the second operation performed The trial court sustained an objection made by the defendant on the ground that the question could be answered only by medical men We are compelled to hold, the court concluded that there was neither evidence, nor inference from the evidence to substantiate the plaintiff's contention The defendant argued that under its contract it was not compelled to pay for treatment of a disease for a period longer than twenty-six weeks and that the ulcer was a preexisting sickness for the treatment of which it was not liable. This contention, the court said, is founded on provisions of paragraph three of the rider to the contract Neither the jury nor the members of this court are able to determine the proper treatment of the plaintiff's ulcer The doctor attempted for over a year to cure the plaintiff but finally had to perform the operation. We cannot determine in the absence of medical evidence, and there was none, that the operation should have been performed within the period mentioned in the contract We must decide this case in favor of the defendant for the reason that the ulcer from which the plaintiff suffered was a preexisting disease for the treatment of which the defendant was not liable under its contract. Medical testimony showed that many people have ulcers of the stomach and never have any trouble or pain to indicate that they have the condition, which at a later date becomes acute We therefore conclude that there was no evidence which justified the court in submitting the case to the jury but that, on the other hand the evidence showed that the defendant had complied with its agreement contained in the contract Accordingly the judgment in favor of the plaintiff was reversed with instructions to dismiss the action—*Schultz v King County Medical Service Corporation 165 P (2d) 857 (Wash., 1946)*

AMERICAN BOARD OF UROLOGY *Oral* Chicago, February 1947 Final date for filing application is Nov 15 Sec., Dr Gilbert J Thomas, 1409 Willow St Minneapolis 4

# NATIONAL CONFERENCE ON RURAL HEALTH

## First Annual Meeting, Held in Chicago, March 30, 1946

### Purpose of Conference

DR F S CROCKETT, Chicago The purpose of this conference is to seek improvement in rural medical service Rural medical service is more than having a doctor in the community Good housing, warm clothing, a suitable diet, together with adequate health education are important factors in maintenance of rural health The problem is economic and social as well as professional Given all of these, yet the well trained physician cannot operate in a professional vacuum The good physician never ceases to improve his educational and professional skills He must have available diagnostic resources such as the laboratory, x-ray and an opportunity for consultation with his fellows and with those who have acquired special training, if he is to give the sort of service satisfying to his professional soul Attracting and retaining well equipped doctors, such as returning veterans and recent graduates, to areas some distance from medical centers will be helped by what we doctors and interested farm groups do here and carry back to our home states

The problem cannot be solved on a national level It must be worked out in the community where the need resides Every one in the community must join if any effort is to succeed One of the first things to be done is to find out where medical service is lacking Some states have made surveys of rural and urban medical facilities In some states councils have been created joining all elements within the state in this health effort. Committees of state medical societies should join actively with their comparable farm group committees in identifying themselves with existing state councils or inspiring the creation of such organizations where not now existing Since legislation to create more hospitals and other facilities may be passed by Congress rural areas will benefit. This feature should be of especial interest to us

Sound judgment should direct the location of hospitals and other facilities in relation to population served—distances that the sick can be transported, the physical features of roads and terrain and the professional personnel available for good results

Providing plans for the payment of good medical and hospital care is another part of our problem It is hoped that in all our states the medical profession will sponsor plans to aid those who find it difficult to pay for catastrophic illness In some states such plans already exist but serve principally industrial groups Our state committees should seek to extend these benefits to country people. One of the difficulties will be in application of such plans to farmers of the marginal type unable to pay the usual total premium for medical care and hospitalization insurance Whether the general plan of the Farm Security Administration could be adapted to this segment of our country population where the family pays something which in turn is supplemented by general taxation, remains to be seen I believe it has possibilities as well as difficulties At least it is something for our state committees to consider

It is our duty the duty of those we represent, to exercise the greatest vigilance wherever we believe our common interests are threatened through federal domination There can be too high a price paid for help Medical care of our farm people is a nationwide problem which can best be solved on a state and county basis This is your opportunity to do a constructive job in your own home states

### Address of Welcome

DR OLIN WEST, Chicago I extend to you in behalf of the Committee on Rural Medical Care of the American Medical Association and the American Medical Association and its constituent units a most cordial and sincere welcome. We are delighted to have in this audience representatives of national farm organizations, individual farmers, representatives of state medical societies and some physicians not representing any of those organizations The American Medical Association and its constituent units are sincerely interested in the efforts being made for the solution of the problems involved in the farm care. Some states have already organized committees representing organized agriculture. These problems are not going to be easy of solution Some of the problems involved are factors that are actually involved in biologic law, the very law of nature, and in economic law These laws are well nigh immutable Many of those factors or changes effected in those laws are going to be effected through process of evolution and not through revolutionary procedures

### The Farmers' Medical Care Problem

MR RANSOM E ALDRICH, Jackson, Miss The chief problem of medical care in rural America is cost. It is economic. It is social I live in a county that doesn't have an active practicing physician The nearest physician is 22 miles away The flat charge is a dollar a mile. The low income group in American agriculture simply doesn't get medical service from that kind of charge They go without it I don t know that the doctor can render service any cheaper than that. I know we must work out some type of prepayment plan We must work out a program of health centers, diagnostic clinics, ample service and large hospitals in the areas where they can be supported. Some of our people are too anxious to build hospitals in areas that can't support them Before a hospital is established there must be a survey made and adequate profession for maintenance in that community It would be a tragedy to have ghost hospitals all over America We can provide hospital services and adequate beds, and then I am urging your group to see that rural America has just as good a supply of doctors as any other group in America and that they are just as well trained Frankly, people think you have the standards too high for doctors Your costs are exorbitant. I don't entirely subscribe to that I do say we have a shortage and I think it is up to you and the agriculture group to stimulate interest in producing enough doctors to serve rural America From our committee of the American Farm Bureau Federation I pledge you our support in trying to work out a constructive long range adequate program

#### DISCUSSION

DR L W LARSON, Bismarck N D Rural health has always been a problem. Education of the farmer through the public schools and universities, press and radio and improvements in the means of transportation from the farm to the town and from the town to the city have certainly decreased the seriousness of the problem. However, two phases of the problem remain unsolved, they are (1) availability and (2) cost of rural medical care Availability of rural medical care resolves itself into the problem of either bringing the doctor to the people or making it possible for the people to get to the doctor The fees for the actual services rendered by the rural practitioner are not exorbitant, they are usually much lower than the fees charged for comparable services in urban areas Improvements in transportation, particularly in the development of good highways which are passable throughout the year, will accelerate the growing tendency of rural people to bring the patient to the doctor This will reduce the cost of medical care, it will conserve the time of the physician, who too often spends the majority of his working hours in traveling to and from his patient. The only solution of the problem of cost of rural medical care is to raise the level of the farmer's income or reduce the cost of the physician s services or spread the cost of medical care throughout a prepayment medical insurance plan

### A Public Health Program for Rural Areas

DR. FRED D. MOTT, Washington, D. C.—The disadvantage in rural health is chiefly with respect to those conditions which can be influenced directly by modern health educational and preventive services. Thus the death rates of rural infants, preschool children and youths 15 years of age and over were higher in 1940 than those of residents of large cities. While cities of 100,000 or more had an infant mortality rate of 34.3 in 1942, the rate was 43.3 in rural places and 44.6 in semirural towns. The rural maternity mortality rate in 1941 was almost one third higher than the big city rate. As of 1940 we find that the infectious and more or less preventable diseases take larger rural tolls. If we consider the most rural state and the most urban state in each of the nine census regions we find that, as a group, the most rural states had higher case rates in 1942 for chickenpox, whooping cough, mumps, scarlet fever, diphtheria, septic sore throat, malaria, bacillary dysentery, typhoid and paratyphoid, tularemia and smallpox. Trends show that tuberculosis and syphilis may soon become primarily rural. Despite gratifying progress since passage of the Social Security Act in 1935 there were still 1,242 counties in 1942, 40 per cent of all the counties in the nation, without full time county or district health departments. Excluding the people covered by municipal health agencies in these counties, there still remained 33 million people, one fourth of our national population, lacking the protection of a full time health department. Moreover, this consideration of the counties lacking any official health coverage gives only part of the picture. Few of the rural health departments that we do have are housed, staffed or financed in a manner adequate to do their job.

Competent authorities agree that $2 per capita is required to provide satisfactory public health services. Yet in rural counties the per capita expenditure for public health work is hardly 50 cents annually. Total expenditures by local health agencies in our most rural states in 1942 were at only about half the rate of those in the most urban states. A study of Farm Security borrower families in 1940 showed that only 37 per cent of children up to 8 years of age had been vaccinated against smallpox either at public health clinics or by private practitioners. In contrast, 89 per cent of children in this age group had been vaccinated in twenty eight large cities studied in the National Health Survey. The same story holds true for tuberculosis control, venereal disease control, health education or almost any other accepted function of a local health department.

The American Public Health Association has proposed a sound plan that would group counties with small populations into districts of at least 50,000 people. On this basis the 3,070 counties in the nation could be grouped into fewer than 1,200 districts, a far more sensible organization of public health than today's 18,000 independent, uncoordinated health jurisdictions. If rural communities would put up about one dollar per person per year themselves to match about another dollar coming from outside sources, far more could be done to improve rural health than anything we have accomplished up to this time.

Most states now have permissive legislation regarding the establishment of local health departments. Under these laws a county or a community may appropriate funds for public health. Surely we have reached the stage where we should insist on mandatory state legislation under which appropriate public health units would be established throughout the state and their financial support would be required. We already have laws of this kind governing the establishment of public schools. Similar legislation would be the surest way—and an entirely practical and intelligent way—to make public health services available to every rural citizen within a reasonable period of time.

The major public health problems today are the degenerative diseases of advancing years—the various diseases of the heart, the blood vessels and the kidneys, diabetes, cancer and arthritis.

I want to touch on the fundamental question of rural purchasing power and the medical purchasing power of farm families. In 1941 half of all farm operators had annual net cash incomes of less than $760 per family, including income from all nonagricultural sources. So far as rural medical purchasing power is concerned, as contrasted to general purchasing power, it is revealed most readily in the annual expenditures per person for medical care by median income families. Studies show that in 1941 median income urban families spent $26.76 per person for medical care, while median income farm families spent $14.37 per person, or hardly more than half the urban expenditure.

It is not surprising that there is so close a relationship between purchasing power and the distribution of physicians, dentists and nurses and of general and other types of hospital beds. Modern medical services of high quality cannot be provided without adequate resources in personnel and facilities.

Before we set out to solve the whole problem of payment for medical services on a voluntary basis we must not only face these cold factual income and expenditure figures but we must remind ourselves that fewer than 5 per cent of the whole population now receives general medical services on a prepayment basis. Less than 3 per cent of all farm people are covered even for Blue Cross hospitalization and, taking whole states, the states which are over 70 per cent rural had just 4.2 per cent of their population in Blue Cross plans last July 1 as against 18.7 per cent in the states over 70 per cent urban. We must note too that in voluntary plans offering general medical care—aside from those sponsored by the Department of Agriculture—the greatest urban rural disparity is found with respect to medical care insurance sponsored by medical societies. As of 1945, medical society plans covered 3 per cent of the population of the twenty states that are over 50 per cent urban, but in the twenty eight predominantly rural states they covered only one half of 1 per cent of the population.

Before we look at the voluntary prepayment approach with optimism, we must ask ourselves frankly how many farm families can afford to join comprehensive medical service plans. There is general agreement that a plan offering physicians' and specialist care, hospitalization, dental services and prescribed drugs would cost at least $100 for a family of average size. Studies show that farmers had to have net cash incomes averaging well above $2,000 in 1941 before they made average expenditures of $100 or more for medical care. The fact is that not more than 20 per cent of all farm operators had such incomes in 1941, counting income from all sources. The great majority of farm families throughout the nation simply cannot afford to purchase adequate health protection on a voluntary prepayment basis.

We have a choice to make. Each road we may choose has its toll. One road winds for a time through the field of voluntary health insurance. Although this road is an improvement over the past, its toll is one we should calculate honestly. It has its cost—in almost certain failure to bring anything approaching maximum health opportunity to the majority of our 57 million rural citizens. There is also a hidden cost behind these phrases that we must face. There are people living out over this broad land—people on farms and in villages—people whose babies get sick, whose children break arms and legs, who get every physical and mental disorder known to American medicine. These people want competent physicians nearby, they want a modern hospital within reach, they want certain specialists closer than the metropolis 200 miles away. And they want a simple and sure method of paying their share for the support of these essential resources. I, for one, am unwilling to say to representatives of the farm population that these objectives are utopian. On the contrary, they are realistic, they make sense and they are attainable. But it will take more than the road winding through the tempting pastures of voluntary health insurance to reverse the inexorable trends dictated by economic laws. We may choose this first road—for five years, for eight years or for ten years—but if we do, let us count the cost along with any gain.

There is another road we can choose today, the road charted by President Truman. It is broad and it is direct—the way of compulsory health insurance. In one sweep it cuts through the economic barrier, bridges the uncertainties of individual medical costs and stretches out into the future a solid economic foundation for all the challenging measures we can devise to build good health. This road also has its toll, but of a different sort. If we choose this road, the cost we shall pay will be found largely in the taxing of our minds and our imaginations to build, and build promptly, on the solid and unaccustomed economic base the system will provide.

Think for a moment what it would mean if we had this central core of national health legislation Medical purchasing power would be spread evenly the country over Hospital planning and construction proposals would suddenly have real meaning for rural people, for hospitals could be placed where needed once their maintenance was assured The urban-rural double standard would be wiped out—rural people would be assured the number of hospital beds they need and not just those they can support today Something like ten dollars per person would suddenly become available to pay physicians bills each year—$10,000 for every 1 000 rural people $20 000 for every 2,000 people Think of the opportunities this would create in hundreds of underserved rural counties Picture the flow of veteran physicians and new graduates into rural districts under these changed economic circumstances and with the assurance of hospital or health center facilities

Farm leaders have a responsibility to see that farmers know all the facts when they make their choice They should know all the strong and weak points about voluntary prepayment plans They should know the facts too about the President s program They should know that the day to day administration of the President s program will be local They should know that in this program local people and their doctors will serve as consultants in their localities They should know that—as always—they would choose their own doctors and their hospitals And they should know the cost of either course in terms of money Under the President's proposal for a national health program the farm family would pay from 3 to 4 per cent of net income for personal health services The average percentage of net cash income spent by farm families in 1941—for inadequate services—was actually 8 7 and the percentage spent by low income farmers was higher yet. It seems unlikely that farmers will miss the point or will fail to recognize the clear advantage to farm people and to entire rural states of pooling the resources of the whole nation to tackle this problem

DISCUSSION

DR. VICTOR JOHNSON, Chicago The small enrolment in voluntary plans for hospitalization and medical care cited by Dr Mott is deceptive since the absolute figures do not include the important factor of expansion and growth For example, a few years ago only 700 000 persons were enrolled in hospital prepayment plans In a few years this figure has been multiplied more than twenty times so that today there are twenty million people enrolled in one system alone the Blue Cross, which is the largest of the hospitalization insurance plans Again in the state of Michigan the medical care plan sponsored by the state medical society has grown to nearly a million subscribers or one in five to six of the population in a relatively few years We may look forward to growth of medical care insurance coverage in other states on the basis of the experiments in Michigan, so that in a few years there may be many more people insured for medical care than are now enrolled in the Blue Cross hospitalization plans

To be successful and to meet the needs of the country it is essential that prepayment medical care insurance be expanded greatly and provide a wider coverage. First this must be done for those who can pay their own premiums Such expansion should include the farm as well as the urban population of the country Negotiations are now under way between the California Physicians' Service and the Grange in California for group coverage of farm people Such arrangements should be consummated elsewhere as well so that farmers and city dwellers will enjoy the benefits of medical care insurance Secondly there must be efforts and experiments directed toward the inclusion of some of the indigent and the medically indigent in these programs 'How this can best be done presents a serious problem. Many of the indigent have chronic illnesses, and in many instances the illness may be the cause of the indigence Patients with such chronic illnesses as tuberculosis or mental and emotional derangements are soon likely to find their funds exhausted in the course of the illness Perhaps such groups must continue to be provided medical care as special problems outside the scope of prepayment insurance plans Certainly the inclusion of considerable numbers in these categories is likely to threaten the financial structure of any prepayment medical care plan On the other hand there is probably a large group of indigent or medically indigent people whose inclusion into medical care plans would not disturb the financial soundness of the programs or impose unduly high premiums on every one

Perhaps information concerning the best way to include such groups will be forthcoming from another major experiment in improved medical care being conducted in the state of Michigan under the auspices of the Michigan State Medical Society This experiment deals not with the indigent but with another group for whose medical care the federal government has assumed responsibility This group is that of the veterans with service connected disabilities The Veterans Administration has entered into contracts with Michigan Medical Service to provide care for this group employing the fee schedule of that prepayment insurance plan. The physician collects his fees from Michigan Medical Service which in turn bills the Veterans Administration This plan for veterans is also being organized in other states and may well provide a formula on the basis of experimentation for a considerable increase in the coverage of the lower income groups of this country by prepayment medical care plans

In our efforts to solve the problem of improved medical care it would appear wiser to proceed along these experimental evolutionary lines than to make sweeping revolutionary changes Experiments should be conducted even with compulsory medical care insurance in circumscribed areas or communities One such experiment is already under way in the state of Rhode Island, where compulsory insurance is employed in industry, with contributions by the state, by industry and by the insured employees Much has already been learned from this worth while experiment. After the first year of operation of this plan certain significant conclusions were reached by all participants, including the physicians It was found that red tape was excessive, interfering with the quality of medical care. It was also found that the costs of administration were more than was anticipated Finally it was found that there was need for decentralization of the program. The latter finding was particularly significant in the light of proposals for nationwide compulsory insurance, since Rhode Island is one of our smallest states with a relatively small population of both physicians and patients Such illuminating experiences promise to provide much valuable information for the extension of our experimentation into further methods for improving medical care in this country

Throughout all such efforts it is imperative that we keep ever before us the necessity for maintaining a high quality of medical care It would serve no useful purpose but rather produce much harm if extension of medical care to all geographic areas and to all the citizens of the country was to be accompanied by a deterioration in the high quality of medical care now being provided

### Health Program for Small Communities

MR HOWARD STRONG Washington D C. Rural health service may be broken down into three categories (1) medical service by physicians in private practice, (2) service through hospitals medical centers and clinics and (3) public health service through official agencies

The distribution of service by private physicians varies widely It is generally assumed that the proper ratio is about one physician for each 1,500 people. Cities and metropolitan areas have the largest number of physicians per thousand of population, while the rural areas have the smallest proportion.

The most immediate need is the supply of physicians for rural areas and there the situation at present is not too encouraging Sixty thousand doctors were called to the service. These men are now returning The majority are going back to their old practice But a sampling made by the Procurement and Assignment Service shows that only 23 per cent of this former practice is in towns of less than 5 000 and in the rural areas Between 15 000 and 20 000 of the returning physicians are young men who had established no practice before going into the service, and these men want to go to cities ranging between 25,000 and 250,000 There is a very definite reason for this preference

for the larger city The younger men who have graduated more recently from the medical schools have been trained in the use of all the hospital, technical and clinical facilities of the larger city With the development of diagnostic and clinical technics and equipment, and of increasing specialization practice without adequate clinical and hospital facilities is becoming increasingly difficult and unsatisfactory A physician hesitates to go into smaller towns and rural areas which do not offer these facilities He will go to the larger city where they may be found. This brings us to the possibility of increasing these facilities in the rural areas and here we find some encouragement

The National Commission on Hospital Care inaugurated by the American Hospital Association is making in cooperation with state health departments a study of hospital facilities and needs throughout the nation as a basis for a national hospital program. This is the most complete study that has ever been made and out of it will come, it is hoped, a national program which will have the cooperation of all health and hospital agencies, public and private, and of the medical profession, throughout the United States

A small community or a sparsely settled rural area cannot afford to employ full time health officials and provide adequate service A recent nationwide study of health department facilities indicates present local facilities and needs and proposes the development of a system of health administration under which several rural counties may combine in the employment of a health staff and the maintenance of a central office This proposal contemplates a total of 1,197 health units for the country It would make adequate public health facilities available to every section of the country—cities, towns and rural areas A town of 15 000 or 20,000 with county, multicounty, state and perhaps federal assistance usually can build and support a 15 to 40 bed hospital with necessary medical and nursing care, provision for the practice of internal medicine, obstetrics minor surgery, dentistry and some other specialties and with simple laboratory equipment. Such a small institution can serve a majority of the hospital needs of a small community with its rural area if it has the opportunity to refer complicated cases to the larger hospitals And great promise lies in the recent activity toward the provision of nationwide medical care on a prepayment basis Congressional bills propose a universal tax supported medical service. The American Medical Association proposes a nationwide voluntary prepayment plan based on the action of local medical societies These proposals represent two widely divergent schools of thought, and the proponents of each are vigorous and sometimes acrimonious in their support But all this does not mean that health service is going to be presented on a silver platter to every community and to every rural area. The larger political units, federal and state, are not going to do it all County and town communities must participate with citizen enthusiasm and with tax and voluntary funds And this is where you, representing most of the farmers and rural areas of the country and we representing small as well as big businessmen and their organizations come in You have the responsibility for convincing the rural population that health is a sound dollar investment as well as a human asset. We, for eighteen months, have been seeking to stimulate interest in the smaller communities of the country to provide more adequate health service. The response has been beyond our expectations Smaller communities all over the country are seeking ways and means of providing more adequate health and hospital service. And definite action to this end is increasing We expect to intensify this effort in cooperation with the American Medical Association and to help in bringing to these areas the importance of local action if adequate health provision is to be made.

## Health Education for American Farmers

LELAND B TATE, PH D, Chicago The Farm Foundation which I represent is a private, philanthropic organization whose objective is the stimulation of research and education for the improvement of rural living conditions Our policy is to work with various agencies, organizations and leaders interested in the general welfare of rural people and to stimulate activity where needs are great and progress is slow Hence some of our chief concerns are better medical care and health services for farm folks, and health education of a broad nature which brings (1) knowledge and understanding of what is desirable for maximum health and (2) insight into ways and means of getting and paying for adequate health and medical services

In our rural health work we have stressed particularly ways and means of getting more personnel facilities and services We have used both regional and organizational approaches From a regional point of view we have concentrated our efforts mainly in the Northern Great Plains from Nebraska to North Dakota and in the Southern states from Virginia to Texas Various measuring devices show these as predominantly rural regions in need of many more and more widely distributed doctors dentists, nurses, hospitals and health centers On a somewhat informal basis we have worked with farm organizations, research and extension divisions of agricultural colleges, the National Extension Service, public health people, medical colleges, state and regional health planning committees and various medical health and lay leaders, both private and public.

It seems to us that any one who plans an educational program for American farmers about health services and medical care should know at least five fundamental things (1) the meaning and significance of health and education separately and in combination, (2) the characteristic facts about farm people as a segment of the total population, (3) the forces that prompt farmers to think and act as they do, (4) suitable subject matter content and (5) appropriate appeals and teaching technics

To us health education is considerably more than giving instruction and having people learn about health rules, routines safety sanitation and other traditional topics A comprehensive educational program about health matters might well attempt to (1) create awareness, (2) overcome inertia and indifference, (3) soft-pedal fear complexes, (4) explain the basic factors affecting health in a positive way and in a negative way, (5) describe existing health situations, (6) make known available facilities and services—how obtained when, where, by whom, under what conditions, and (7) clarify alternative ways and means of getting more facilities and services their possibilities and limitations their advantages and disadvantages

An educational program for farmers about health matters should take into consideration the forces that prompt farmers to think and act as they do This covers much of what commonly is called farm psychology It is apparent that many factors influence the prevailing ideas which farmers and others have about health services and medical care. Among these are traditions or handed down beliefs, customs or handed down procedures, attitudes or feeling tones toward certain things and persons, experiences with biologic objects such as growing plants and animals, self employment and what it implies, and economic uncertainties due to the great dependence on weather in farming operations These factors need particular emphasis and consideration in developing plans for educational programs about health matters as far as farm people are concerned. Failure to recognize these factors may jeopardize maximum progress toward desired objectives

The economic factor is a very important one to consider when appealing to farm people. For example, it can be stated positively that sound health means productivity for making money Ill or half sick persons with impaired strength and will power mean costly waste in most rural communities This situation is a barrier to economic efficiency even though no direct payments are made to doctors and hospitals Labor represents more than half of the farmers' cost of production. If this labor is of low quality because of sickness or impaired effectiveness, every day lost is reflected in lower earnings Hence good health becomes a prerequisite for full time employment on efficient farmsteads Emphasis too may well be placed on present high costs for medical and dental services to rural people out of proportion to their paying ability Together these two economic considerations—one direct and the other indirect—make a strong appeal to most persons

## Summary Discussion

MRS CHARLES W SEWELL, Chicago Today, in a realization of the great needs in rural America for more adequate health programs, more doctors, nurses, hospitals, equipment, better roads, economic improvement and more education to meet these problems intelligently, we come as doctors to a clinic. Here

we have counseled together, exchanged opinions regarding new or controversial treatments and now should determine our course and throw the high powered x-ray of knowledge on hidden causes of unsuspected malady

Perhaps the first of these would be the scattered population—the disproportion of organized farm families to those found in unorganized groups The low income of such large numbers of rural population is another tremendous handicap A third is the irregular income, since great numbers of farm people do not have a source of revenue except from the sale of products three or four times in any given year

Farm people are proud and conservative and as far as possible are anxious to pay their own way In twenty-six states, members of our organization who are residents of a territory not too far removed from some of the larger metropolitan centers have been able to work out satisfactory arrangements for hospital insurance and in some instances complete medical care.

The principle of insurance through mutual benefit associations, for hospital and medical care, appears to us to offer a plausible solution As rapidly as possible, workable plans already in existence should be extended until they reach the remotest parts of rural America However, we are not blind to the frailties of humanity, and rural people are not greatly different from those of any other group A program of education for this type of insurance must be carried forward until health and hospital insurance provisions become just as well known and as genuinely accepted as fire, automobile and life insurance.

The American Farm Bureau Federation has favored the objectives of legislation providing that the federal government should reasonably extend its public health program with respect to maternal and child health, rural hospitals, public health services and medical care for those unable to provide such care for themselves Such legislation should safeguard the rights of the states to develop their own programs to meet their own local needs The federal government is not justified in assuming the burden of supporting the health and medical facilities that the states can and should bear, but only to the extent necessary to bring about equalization of health and medical facilities among the several states

The proposals of the Hill-Burton bill, now before Congress, designed to establish commissions to study health needs and to set up hospitals in rural communities, is one of great interest to us It is to be hoped that if such arrangements are completed the utmost care will be taken to place the hospitals in communities of greatest need, and not only the problem of building but that of maintenance and location, receive careful consideration Again it is imperative that there be an adequate number of trained personnel, doctors, nurses, technicians and laboratory assistants

We are disturbed by proposals designed to provide compulsory federal hospital and health insurance Our chief concern is to get more adequate medical care and hospitalization for our farm folk. We are wondering if the personnel set up to administer such a health program would know no more about the subject than those placed in positions of authority in other governmental bureaus dealing with agriculture and who recommended taking the shoes off a horse at night to save critical steel as a war measure." We wonder if it would require as many trips to the county seat to secure stamps for medical care as it has done to get gasoline, tires farm machinery and rubber boots in order to carry on agricultural production We wonder if the stork could delay his visit while the necessary red tape was cut or if we might receive a directive such as the sheep men were presented advising them in the face of shortage of herders for the critical lambing season to 'postpone the lambing until more favorable weather We have repeatedly expressed our opposition to compulsory insurance plan by resolution In answer to the statements that we are not moving rapidly enough with such a program we point to the growth of Blue Cross Like a Chinese scholar who taught the famous Chinese marching song to groups of soldiers ten at a time and then in twenty minutes had an army of ten thousand singing Many hearts with one mind Brace the enemy s gunfire—March On—March On" a song heard round the world, we believe it can be done through voluntary effort on a broad educational program

Our organization is particularly interested in the development of plans that will permit of bringing the cost of medical care more in line with the prices which are obtained by farmers as they exchange their products for the labor and services of health agencies It is one thing to pay $150 for a surgical operation when wheat is $1 per bushel and an entirely different one to pay the same cost with wheat at 50 cents per bushel

The prevailing cost of a bedside call in most rural communities is still based on the practices established during the horse and buggy days, necessitating longer absence from the doctor's other patients or office than is now necessary

DR HARRISON H SHOULDERS, Nashville, Tenn I should like for you to think of medicine as being entirely preventive When a department enforces sanitation measures it's to prevent the transmission of disease There has been entirely too much segmentation of this whole problem of medicine As science has progressed it made apparent the fact that there are preventive measures that require the use of the police powers of the state. There are many other preventive measures which are placed in the hand of the individual physician and individual citizen An individual cannot enforce a quarantine The executive department can A state department can I cannot enforce a sanitary and milk order An executive force can For that reason and for the time for that reason only, public health departments were created And they did a fine job when they confined themselves with these particular powers We are for public health, but the question comes down sometimes to what is meant by it Diseases have disappeared under public leadership, under public health departments and with the prudent use of the powers covered beyond them Today such diseases as diphtheria and smallpox could be prevented by individual effort, I mean by inoculation to a large extent in the hands of individual citizens and individual doctors With that broad, simple division of activity then the question comes up Shall we pursue in this American way of life to use our individual efforts and our individual genius and our individual financial aid? It comes down to the economic situation Lets consider the cost of such things in a rural county These public measures serve their purposes largely when cities realized that they required sewerage, sanitation and similar benefits The farm community is still an individual unit. Any public agency must perform most of the activities on an individual basis In a city it is different. People become congregated and congested Geography and location have a lot to do with the problem. In a county of 30,000 with a birth rate of 25, it costs $15 per child to inoculate against five preventable diseases A suggestion made this morning would require a dollar per head, $60,000 a year, to carry out the public health measure of the country

### Application of Medical Knowledge

HON J PERCY PRIEST, Nashville, Tenn How to make rural life in the United States sufficiently attractive and sufficiently stable to permit the production and utilization of essential farm and related products within a pattern of intelligent conservation of rural resources—both human and natural—is not merely a question for emotional appeal to the humanitarian. It is one of cold, calculating, hard headed economic significance—yes, even political significance.

Every one is agreed that the health record of the United States is—on the whole and relatively speaking—good. There is agreement also however that it is not as good as it should be not as good as it is possible for it to be. Indeed, for certain areas in the country and for certain groups of our people it is agreed that the record itself is definitely not good

One of the issues that is repeatedly before the Congress is whether the benefits of proposed health legislation, whatever it may be, will eventually be realized by the people who need them most It is impossible to conceive of health legislation that would apply with equal benefit to all parts of the country As a result we are faced with the question as to whether we should legislate down to the least advanced areas or up to the most advanced It is my opinion that the only way to progress is through the latter approach It is only in this way that government can meet its responsibility of assuring the whole population, as far as possible, the full benefits of good health care.

Even though science has yet to give us the cure for many maladies, the full application of what is known would do much to prevent or minimize the effects of illness. The real problem, then, is to devise the instruments of organization through which all the benefits of present medical knowledge can be applied to the needs of all the people. Before we can even begin a full attack on that problem we must determine how we can best provide for all the people anything approaching adequate medical care. One vital question must be resolved—this is: How can we pay for adequate medical care for the whole population? The President has suggested that we accomplish this by spreading the cost over the entire nation through expansion of our existing social insurance system. It is my belief that only through application of the insurance principle to the risks of illness can we make possible equal opportunities for health in every part of the country.

Students of medical care seem to be in accord in the opinion that prepayment by groups for medical service is more efficient and hence more satisfactory than postpayment by individuals. Here, again, there appears to be no area of serious disagreement. One finds controversy only on details of how the insurance principle can best be applied. One of the major issues today is whether group prepayment should be on a basis of local control and voluntary participation or on a basis of national control with universal participation.

Health services to a large portion of our rural population are alarmingly deficient. There are far too few physicians and other health personnel, far too few hospitals, public health services and sanitation facilities in rural communities to serve the 57,000,000 people who live in these areas. Since I have proposed remedies to the problems of hospital and mental care, let me take these two fields of need as examples of inequities that exist among rural and urban areas. Adequate numbers of psychiatric personnel and clinical services are exceedingly limited throughout the country. They are nonexistent in rural communities. While the hospital facilities problem is not as acute, the disparity between urban and rural areas in the hospital field is almost as great. Rural areas have about half as many hospital beds as do the metropolitan centers—less than half the number they need to serve their people adequately.

In the field of preventive services these disparities continue. Despite the progress that has been made under the impetus of the Social Security Act, there are still about fourteen hundred counties lacking full time health departments. Practically all of them are rural counties. There are gross deficiencies too in sanitation facilities. The reason is simple. People in rural communities and rural states do not have the purchasing power with which to avail themselves of the facilities and services that are essential to good health care. The year 1943 was unprecedented as a year of farm prosperity, yet the income from farming amounted to only 9 per cent of the national income, while farm people made up about 21 per cent of the population. According to the latest census of agriculture (1940) about two thirds of all farm families had gross incomes of less than $1 000 with one third under $400. States predominantly urban (70 per cent) had an average per capita income of $800, states predominantly rural (70 per cent) of about $300. It is basic to our economy that some solution be found to this grave imbalance, and I applaud the Farm Bureau Federation for its efforts to obtain greater equalization of rural and urban incomes. Until that time has arrived, justice demands that the urban states which are, in a sense, draining off the wealth of their rural neighbors, help to extend into our rural communities those facilities and services which are necessary to good health care.

For the nation to meet its obligations in a field as broad, as complicated and as fundamental as health it is of the greatest importance that the public agencies administering the program be maintained at the highest possible degree of competence.

### Rural Medical Services in Alabama

DR. J. PAUL JONES, Camden, Ala. People in rural areas want all the benefits of first class medical services or science that they have read about; they want more doctors, nurses and all facilities for good medical care. They want an easier and a more economical way of paying these bills, even if it means subsidizing of medical services by state or federal agencies. The day of rugged individualism in rural medicine is passing, the people are demanding better care. In its place is appearing the belief that good medical services can be obtained in areas of low economic income either through taxation or through subsidies. The public is slowly becoming convinced that improved medical care and more hospitals are a public responsibility in the same class as good roads and good schools.

While it is true that improvement in farm income and rural living conditions, including education and sanitation, would of course go a long way toward solving the rural medical services problem, there are certain objectives we could aim at right away. 1. Some way to ease the payment of medical services and hospital expenses, through prepayment insurance for those able to pay, and subsidizing of indigent medical services and hospital expenses by the community or state. 2. Construction of facilities such as hospitals and diagnostic and treatment clinics in those areas where need is found, through grants-in-aid, if necessary. 3. A better cooperation between our medical, dental and nursing schools and this system of hospitals so that doctors, nurses and technicians could be trained to staff these facilities. 4. Broadening of preventive public health services and sanitation programs. This problem of better medical services to all the people of Alabama has been recognized by the Alabama Medical Association for several years. In 1944 a committee was appointed by our president to investigate a method of securing a broader and better type of medical services for our people. At a meeting of the committee a definite program was sponsored.

### Action of State Rural Health Committees

DR. A. S. BUCHANAN, Prescott, Ark. Our program was instigated in 1942 by the county medical society or by the Farm Security Agency and had the cooperation of the county medical society. This little program has succeeded very satisfactorily. We have had no trouble in the organization or in the management as to whether it would suit all communities and neighborhoods in the state. To make it possible there would have to be some changes made to suit each community. I think that would be true in the organization of a national program. It has been satisfactory in that county. There has been one in Texas, one in Mississippi, one in Arkansas and perhaps one in Georgia. I understand that these other counties have been equally satisfactory. There was some question as to whether we would as a county medical society have the management of the program. We were accused of cooperating with those in favor of socialized medicine. I want you to know that is not true. It is a very good program. It takes care of all the people, not only farmers. I think the majority of farm families that really need the assistance of others are on the program.

DR. FRED A. HUMPHREY, Fort Collins, Colo. In Colorado we have attempted to solve the rural problem by prepayment health insurance. This is working under the Colorado Medical Service, Inc., and we are at present trying to scatter that all over the state. The previous speaker mentioned the Farm Security Agency. In western Colorado that was a complete flop. In eastern Colorado it worked fairly well and people got fairly good service. Dr. Mott stated that they were working from the top down. In Colorado we have five counties without medical service. In my opinion that is the place to start, where they do not have good medical service, and work up not down. I belong to a county which is of 35 000 or 37 000 population. We have from thirty to thirty-five doctors. Medical service there is very good. The state and national public health services are doing their best to force us to put in a county health unit. What we would rather do would be to have them go into the counties that do not have medical service and do some good there. It is a mining problem rather than a rural problem in Colorado. We have only about five counties out of some ninety-five that have full health units.

DR. HARLAN A. E. GLISH, Danville, Ill. The Rural Health Committee in Illinois is a new committee. We plan to have one meeting a year in each rural medical society at which meeting representatives of all farm organizations in that county will be invited to discuss their rural medical and hospital problems.

DR E. E SHAW, Indianola, Iowa Many counties in Iowa wish to put across a bond issue and build a hospital Whether they can support it is a question They don't feel that every county should have a hospital Ours is one of the counties that hasn't a hospital We don't need a hospital It is healthy to see the Farm Bureau feel that a hospital should be built only where one is needed We are also devising a medical care plan for farm groups We have organized units for collecting agencies for hospital insurance. Many men are going into it We have the medical service plan just getting started We are already putting out a hospital plan in two rural counties in the state. They want statistics as to costs We are anxious to enlarge medical and surgical plans We shall in the next few years be able to put it in rural areas The Farm Security Agency is very unsatisfactory During the first year it worked fine. Doctors were almost 100 per cent in favor In the second year the agency man came in and changed the thing completely

DR. A R HATCHER, Wellington Kan We have not tried any of the plans discussed here. I'm from Sumner County which has a population of 27,000 We have about twenty two doctors There is a part time county health officer but soon we shall have a full time county health officer taking in a county adjoining us to the west which will make it possible for us to have a full time county health officer, sanitary engineer and nursing staff We have forty-seven counties in Kansas some of which have one doctor, some two, some none There are a great many osteopaths It is the intention of the hospital survey committee, of which I am a member, to give that part of our state the first attention in the way of building small community centers with offices, reception room, laboratory, emergency operating rooms and a few rooms for the doctor who may desire to locate there along with a full time county health officer These other programs that have been discussed I am sure we haven t any particular reason in Kansas for even experimenting with. Even with the shortage of doctors many people have not suffered want of medical care. Roads are available, hospitals there are good and even though you are 50 miles from a hospital you can get there in an hour We're going to give our attention chiefly to the rural districts and get some real doctors, young doctors in health centers and try to apply the Hill-Burton bill, if it passes

DR. CLARK BAILEY, Harlan Ky Two years ago the medical economics committee reported to the House of Delegates that we should have an enabling act that would enable us to take part in a prepayment plan We went before the legislature, and last week the governor signed the bill enabling us to go ahead and set up an organization to have a prepayment plan for the people of Kentucky The medical economics committee asked the legislature for a revolving fund of $75,000 that would put two students through medical school if they will agree to practice in some designated rural community for the next five years after completing the internship That passed but was vetoed by the governor The medical association and the state association made donations to start a fund of that kind to take care of some rural counties that do not have doctors

DR. GUY R. JONES, Lockport, La. We have, as you have throughout the United States, a scarcity of doctors We have tried the Farm Security Agency and found it to be a complete flop Doctors have refused to work under that plan. We shall advocate a prepayment medical and hospital plan. The parish health officers are being urged to support state medicine, but they are working with Louisiana State Medical Society and fighting it. Those gentlemen are not for state medicine. In Louisiana osteopaths and chiropractors are prohibited by law We are well organized and ready to follow any plan advocated by this meeting

DR. H B ZEMMER Lapeer Mich. Whatever has been done in Michigan has been done with the medical society as a whole. We are getting organized and will have some suggestions to make when we get back. Some three hundred farm groups and many grange groups are cooperating with Blue Cross Michigan Medical Service is separate from the Blue Cross and we are proud of its accomplishments It has had its greatest memberships in industrial groups and is now being extended to farm groups We feel that it has done a splendid job in rural groups We are hoping that the Hill-Burton bill will help us solve the problem of hospitals Another thing we have obtained in Michigan is a uniform fee schedule for all government agencies, worked out by the council of the Michigan State Medical Society after much discussion Adoption of this schedule made it possible to cooperate with the Veteran's Administration On this program the service is for service connected disability Before the war there was a preceptorship with the university Juniors and seniors were assigned to doctors throughout the state This was a splendid idea. It gives the student a fine chance to get some bedside manner and gives doctors a chance to come in contact with newer technics I hope it can again be established.

DR B J BRANTON Willmar, Minn Minnesota is a state with two and one-half million people and eighty-four counties About two thirds of the people are in the rural population one third being urban. In the eighty-four counties of the state there are only three, four or five not having hospitals Roads are excellent throughout. The need for the Hill-Burton bill is evident in some places We have in Minnesota the number of hospitals we need at the present. The prepayment medical plan is going to serve a fine purpose. We have worked closely with the Farm Bureau It has been a wonderful and friendly feeling to have people who control the destiny of some 60 000 farm families in the state behind us in our work. We are working with and in conjunction with Blue Cross which now has about six thousand contracts in the state. We have put over a health education program.

DR R. W KENNEDY Marshall Mo We have plans for the extension of prepayment medical care and prepayment hospital care, information on placement of hospitals and enlarging the state university to four years with the final year in Kansas City to provide more doctors We have a plan for extension of public health To promote health among farm folks we have provided a committee in the woman s auxiliary and a speakers' bureau Doctors in this area are called on to make health talks to farm people.

DR E M GANS Harlowton Mont There has been a prepaid medical service established in Montana. There is a low bracket group up to $5 000 a year

MR. M C SMITH, Lincoln Neb We do not have a rural health committee There is a Nebraska Health Planning Committee as part of the extension of the Agricultural School in Nebraska The state medical association has had representation on that committee We are another of those states that have four counties without a physician. The committee has established with the approval of the state medical association a cooperative health plan in Thurston County where there has been no physician This cooperative plan has worked with a varied degree of success The greatest difficulty is to keep a doctor out there. It is very difficult to keep a doctor in sparsely settled areas A doctor wants a better educational opportunity for his children People up there have plenty of money and are willing to spend it to have a doctor in their own community They took an old hotel and built a hospital there. The plan worked except that they can t keep a doctor there. We went through that area with the Farm Security Agency and organized eighteen or twenty plans operating all over the state. As soon as the farmers had raised two or three crops they didn t like the Farm Security Agency Farmers were the ones that wanted to discontinue the plans The farm bureaus, the farmers themselves want to pay their own bills As to the Hill-Burton bill, we do need some hospitals in Nebraska We hope we shall have the opportunity to place some hospitals in Nebraska. Our greatest problem will be where to build hospitals In this state we have a number of towns where they have started local campaigns to build hospitals have raised money and want their own hospital This committee will have the problem of going to the town and say here is the reason why the hospital will not be successful in this territory

DR. DAN MELLEN Rome, N Y Our state is well organized for the prepayment insurance plan. It seems to be successful, and recently a committee made a survey in the rural districts relative to the hospitals, the laboratory equipment and staff

and the number of physicians As far as placing physicians, we have been working in conjunction with the committee on veterans' affairs As we get calls from these areas mostly in the northern part of the state we try with the committee on veterans' affairs to place these men.

DR. W A WRIGHT, Williston, N D We haven't the constructive program that we have had prople tell us about today There is a misconception as to the practice of medicine May I tell you how we think rural medicine should be practiced? It should be clustered around certain metropolitan centers where people go to buy things There is no future in trying to put a doctor in every hamlet, as was felt thirty years ago It is easy for a patient 50 60 or even 100 miles away to get to a doctor with present methods of transportation Perhaps it is a hardship, but I would rather travel 80 miles in North Dakota than 1 in Chicago Doctors should be educated for rural practice. The tendency of the medical schools is to look down on the general practitioner and exalt the specialist. If it was made more honorable, more young men would become general practitioners We need more good general practitioners It takes a large area to support a specialist. If we are going to have good general practitioners we must have more trained in college days to be just that We realize that it is a hardship not to have a doctor in a county But the county is no longer a unit. It is the natural trading center In the next county or over, there may be a good health center I deplore using the county as a unit

DR. CARL S MUNDY, Toledo, Ohio For years we have had a health subcommittee of the planning committee, composed almost entirely of laymen, but the state association has had a representative on that committee since its beginning Through that representative our state association has been in touch with the thinking of the farm groups This committee attempted a year ago to put into effect a prepaid plan on a small scale in one of our counties The plan did not succeed, although it was supported generously by our state association In the last few months we have started our prepaid medical service plan which we call the Ohio Medical Indemnity, Inc. We are just now beginning to sell contracts It is our intention to push the sale of these contracts in rural areas as rapidly as possible. We found the same thing in Ohio—an inertia among farmer groups to prepaid medical service. We are able to sell contracts to only about 30 per cent of their membership We cannot determine the exact reason

MR. KENNETH G MANNING Portland, Ore. We do not have a rural health committee in our state. I have been sent here representing Oregon Physicians' Service, the association approved and sponsored by members of the state society The setup has approximately 50,000 subscribers under the hospitalization plan. In the state of Oregon about 140,000 are covered. As for rural problems in that area, surprisingly I have not heard the name of Dr Shadid in this meeting Dr Shadid comes from Oklahoma He has been in Oregon and has sold one or two areas in the state on the idea of organizing a cooperative health center, hiring doctors and setting up health centers selling prepaid medical and hospital care. He is particularly interested in farm areas In Salem, Oregon, they have adequate staff doctors The Farmers' Union and other farm agencies have caught hold of the thing and are trying to sell membership We don't have a serious problem in Oregon so far as medical service is concerned. We had experience with the Farm Security Agency in Oregon The thing has been quite a flop Doctors refuse to work for a percentage which is substandard.

MR. DICK GRAHAM Oklahoma City Dr Shadid will run his chosen path and get little distance down the run. I have heard reference made to the Hill-Burton bill According to statistics only two states do not have a very liberal surplus in their state treasuries And you call on federal aid to do that which the local community should do There has to be an end to this federal spending I doubt if there is a community anywhere in the United States which cannot finance its own health needs In Oklahoma we started with $100,000, we have already completed our survey, and if the Hill-Burton bill becomes a law on the basis of that division we should get only 175 a year I have talked to many veterans who have never been in private practice. They went out of medical school into internship and then into the army For four or five years they have had the finest medical facilities to work with. They had technicians and nurses Those boys are utterly scared to practice by themselves I would not suggest that the medical associations lower their standards but I do believe that the medical schools should take cognizance of the fact that those students may have to go into areas from an economic standpoint alone and practice without the help of the Hill-Burton bill and the technicians and the nurses and I hope that that day will come.

DR AUGUSTUS KECH, Altoona, Pa We do have our rural problem We're not organized It belongs now in the committee on medical economics The state society in conjunction with the state college of health and voluntary agencies selected three counties to survey The Farm Security Agency has had some problems Several communities have been organized, and we have felt that the physician would not get anything out of that practice We have 236 state aided hospitals Hospitals are covered within 30 miles Good roads exist on which to go to and fro We do not need new hospitals, we do need extension of every hospital in bed capacity Our medical service has had a poor start but now since last year has grown It has doubled the number of members and participating doctors It is going it alone and not with connection with any other agency

DR A. W BROWNING, Elloree, S C We have good roads, schools and easily accessible hospitals Our splendid state board of health is doing good work. Every county has a county officer and nurses We have in our county the tuberculosis examination for schools, x-ray units in the county and x-ray at the tricounty examination We have clinics there every week and in two or three towns every week We have been trying to get a medical college in Charleston for years Last June the legislature passed the bill for one and one-half million dollars for a doctors' hospital and also gave us two and one-half million dollars for a survey of the state and for medical centers if needed I don't know any one in my section who can't get medical care or hospital care when needed We have a publicity man to watch out for our interests and have a permanent committee, one from each district, to watch the political affairs in our state. We have Blue Cross insurance passed by the legislature and are trying to bring it into effect. We need more hospital beds, hospitals and small medical centers We are thinking of subsidizing some students while at South Carolina Medical College at Charleston to serve two years in outlying places, also Negroes as Virginia is doing at the college in Nashville, Tenn We believe in the American Medical Association plan of approved insurance, prepayment hospital and health insurance such as Blue Cross We are having meetings all over the state with speakers discussing the Wagner-Murray-Dingell bill.

DR A P PEEKE, Volga, S D Our problem is the same as in Nebraska and North Dakota. We have about half a million population, 342 doctors, 142 over age 65, and 90 per cent of the medical profession are in small cities of 15,000 or 20,000 The big problem in our state is that we have 60 osteopaths practicing

DR. H H SHOULDERS, Nashville, Tenn. When the dislocations of a war period are still with us, it is no time to do permanent planning The county as a unit is not a basis for location of hospitals and a county society That should be considered on the basis of the logic of the situation rather than on county boundaries The people in rural communities complain that doctors charge on a mileage basis I think that was a good basis for the period when it prevailed. It seems to me that the time factor or some other factor should be used. Our profession within ourselves might present some correction. The general practitioner of medicine deserves a great deal more dignity and attention than he has received from the profession. We must improve the concept of the practitioner, and we have done so in Tennessee by an education program The rural health problem is as different from the city problem as it can be. The farmer's home is a unit with individual water supply, individual all the way through. In Tennessee we would make some studies, and

this helped get the appropriation The doctors were alert doing immunization of all diseases and getting reasonable fees for it By doing that they had to keep a nurse. Doctors discharged nurses because they hadn't enough practice That has influenced the economics of rural practitioners We made some studies of counties with equal population in the same general area Rural counties with an alert profession well trained showed a mortality rate no different from that of a county with an equal population with a full time health unit The solution of the rural health problem resolves itself with getting a qualified doctor into the area If immunization will control a lot of diseases, it becomes individual medicine, both preventive and curative Probably we have sold the idea, and that has been made possible by the fact that we have never drawn any sharp distinction between public health activity and individual health activity If we do that most of our problems will be solved

DR CROCKETT In the state of Indiana the house of delegates has organized a committee which is setting up the machinery whereby men who are first class general practitioners will be so certified by the state society after due examination In that way we hope to do that very thing—give every man in the general practice of medicine an opportunity to stand apart on account of the excellence of his work

DR. B E PICKETT SR, Carrizo Springs, Texas Our executive committee passed a resolution to accept any plan that met with the specifications set up by the American Medical Association Mr Ketchum from Michigan suggested that the medical and surgical plan as offered by the state, paralleling the Blue Cross, be accepted and we commended him This plan is getting under way We have some 15 000 subscribers The Blue Cross is quite active in the state, and there are few communities that are not within 30 miles of a hospital

DR. K. B CASTLETON, Salt Lake City We inaugurated a publicity plan in which we made use of a local newspaper having the largest statewide coverage. Since then we have had articles published dealing with medical problems and case reports In these articles no reference was made to doctors names, hospitals or communities We feel that the articles have done a great deal of good in combating adverse publicity received in the last few years We also use radio for this purpose. We are forming a speakers' bureau to supply speakers for civic groups, women's groups and schools We need more hospitals or more beds We need more hospitals where distances are great and doctors scarce. People in Utah don t want federal money for this they are not interested in the Hill-Burton bill The church offered help for supplying different hospitals needed. Several hospitals were built and are maintained by the Mormon Church This plan is endorsed by the Utah State Medical Society and we hope it will fill our hospital needs without calling on federal funds We have a prepayment plan based on the experience of Michigan and California

MR. JOHN W BROWNLEE, Rutland, Vt We have a governor's advisory health council on which the medical society is represented, dentists, public health public welfare and various other organizations That is a temporary organization and is to develop a program for better health in Vermont. It is the hope of the medical society when that work is completed in the next few months that a permanent health council will be set up to embrace all health agencies and also business and labor We don't have the problems in Vermont that some of you have We are inaugurating a medical care plan

DR H B MULHOLLAND, Charlottesville Va In 1940 it was realized that the rural health situation was bad A committee was formed of members of most of the farm organizations and members of the medical, dental and nursing professions This committee was instrumental in having a legislative advisory committee appointed who reported to the governor and legislature, made recommendations, instituted a survey for needs of health centers and hospitals and appropriated $10 000 for a survey We think it is important to go ahead with that because so many communities now have been stimulated to erect health centers and hospitals that are not warranted We shall have extension of the health departments We also got $600 000 for examination of school children This is an important start for the health of the people living in rural areas We hope to have school children examined four times during their school life We got an enabling act so that the state can lend some of the money it has to invest for construction of health centers and hospitals in areas where they are needed as shown by the survey, the loan to be at a small rate of interest and to be a long term loan The rural health committee is also backing the state health council composed of thirty-five or forty organizations in the state, including all farm organizations in the state The legislature also took our advice to continue the study of health problems and particularly the extension of prepayment insurance plans to the medically indigent We feel that we can solve these problems on a state and county level

MR JAMES P NEAL, Seattle This program in Washington for setting up a prepayment plan was organized in 1917 and has been growing until some twenty-one units have been set up coordinated through the state bureau all under the sponsorship of the Washington Medical Society, covering more than a quarter of a million people In 1944, in order to avoid any insurance laws of the state, the doctors created and chartered the insurance company The insurance covers all the subscribers of the local organization This group has been approached by the executive committee of the state farm bureau for a contract which would cover their farmers Arrangements have been made and contracted now in effect in one area on a trial basis providing hospital and medical care for a man and his family for $7 a month In another area quite a number of families in the farming area have complete medical and hospital care as far as the head of the family is concerned but with just hospital care for members of the family, the rate being $4 55 a month These two plans are paying doctors a reasonable fee schedule. The Farm Security Agency started in our state All moved out with the exception of one county The price for that was $35 a year We are also caring for service men, beginning the first of the month under contract made with the Veterans Administration, serviced and handled through the state association

DR. C N NEUPERT Madison Wis If groups are to meet the suggestions in his program I would propose that there must be some required reading Whatever you think of some of these things if you are planning to go into rural health conferences be ready Know what they are thinking Farm folks are acquainted with what is going on. Wisconsin people in rural areas seem to be doing just as well as in urban areas We have no health centers I have been wondering if that might not be a good development in Wisconsin We have our survey under way We have a statewide medical and hospital care insurance policy in connection with the state insurance companies Another in Milwaukee is going along with Blue Cross They are both developing As far as the Farm Security Agency is concerned it is in two counties and is working all right. In this year of operation we have paid out 100 cents on the dollar Don t overlook health agencies Get close to them.

DR H N SMITH Brookville, Ind We have had a rural medical care committee for three years We tried this farm security program in several counties in Indiana. It didn t work out so well It was tried in the county I am in, but as soon as the people were able to pay for their medical care they dropped it. Doctors didn t like it, and patients didn t seem to care much for it. I know there is to be a prepayment medical plan in the state of Indiana

DR JAMES F DOUGHTY, Tracy Calif We don't have many people worried about rural medical care The indigent are taken care of in county hospitals by a paid staff The non-indigent rural farmer in California is a very progressive person who appears as though he was poor and dies rich and the doctor dies poor There is a California Physicians Service for non-indigent people. It offers service to employed groups and is now offering it to the rural families through the Grange of California We service them and they pay for service plus the cost of administration I am impressed with the need for more country doctors of good qualities Unless doctors are educated for general practice instead of for specialists in the city we shall not have good medical care for rural areas An average well trained general practitioner can well take care of most ills

# Current Medical Literature

## AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1936 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied with stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (*) are abstracted below.

Venereal Disease in Army Air Forces in Continental United States, 1942-1944. R. Dyar and J. R. Scholtz.—p. 99.
Use of Penicillin in Treatment of Syphilis of Central Nervous System: Report of 100 Patients. J. L. Callaway, R. O. Noojin, A. H. Flower, Jr., Beatrice H. Kuhn and Kathleen A. Riley.—p. 110.
Seroresistance (Wassermann Fastness) in Syphilis: Discussion for Patient. J. E. Moore.—p. 125.
*Penicillin Therapy of Early Syphilis in 14,000 Patients: Follow-Up Examination of 792 Patients Six or More Months After Treatment. D. M. Pillsbury.—p. 134.
Blood and Urine Arsenic Levels of Patients with Early Syphilis Under Intensive Arsenotherapy. A. B. Cannon, J. K. Fisher, J. J. Rodriguez, G. F. Beattie and Eugenia H. Maechling.—p. 144.
Venereal Disease Problem in Woman's Federal Reformatory: Study of Women Released Over a Period of One Year. H. I. Blair.—p. 165.
Problem of Reinoculation of Human Beings with Spirocheta Pallida: Review of Literature. H. Beerman.—p. 173.

**Penicillin Therapy in Early Syphilis.**—According to Pillsbury, penicillin was adopted as the drug of choice in the treatment of syphilis by the United States Army in the European Theater of Operations on June 26, 1944. As of June 15, 1945 over 14,000 patients with early or latent syphilis, or with syphilis which had not responded satisfactorily to previous treatment with standard or intensive arsenobismuth therapy, had received treatment with penicillin. It was found that the toxicity of penicillin therapy in early syphilis is negligible. Infectiousness, with rare exceptions, is controlled promptly. The incidence of infectious relapse after penicillin therapy is low. Infectious relapse will usually occur within twenty weeks after treatment. The lesions of relapsing syphilis appear most frequently on the genitalia in male patients. Realization of the full benefits of a single course of penicillin therapy in syphilis is dependent on the promptness with which the diagnosis of syphilis is made after infection. Achievement of seronegativity six months after the initial treatment is significantly lower in seropositive primary and in secondary syphilis than in seronegative primary syphilis. The incidence of asymptomatic neurosyphilis disclosed by spinal fluid examination performed six to eight months after treatment is extremely low, especially as compared with the incidence after standard arsphenamine heavy metal therapy. The promise of penicillin as the best single agent against syphilis is being fulfilled.

### American Review of Tuberculosis, New York

**53** 103-194 (Feb.) 1946

*Chest Photoroentgenography in Army Physical Examinations: Review of 40,283 Chest Photoroentgenograms at Buffalo Recruiting and Induction Station. I. A. Schiller.—p. 103.
Miliary Tuberculosis of Bone Marrow. E. M. Schleicher.—p. 115.
Pyopneumothorax: Treatment of 2 Cases with Penicillin. K. T. Bird, B. P. Bushueff and F. P. Dawson.—p. 122.
Transcutaneous Tuberculin Test (Corper): Its Evaluation as Compared with Mantoux Test. L. W. Holden.—p. 129.
Anatomic Studies on Human Tuberculosis. XXI. The Reinfection Complex: Additional Observations. K. Terplan.—p. 137.
Treatment of Experimental Ocular Tuberculosis with Promin. W. Steenken, Jr., E. Wolinsky and F. H. Heise.—p. 175.

**Chest Photoroentgenography.**—Schiller presents the results of routine chest radiographic examination of 40,283 men with 4 by 5 inch stereoscopic photoroentgenograms at the Buffalo induction station. Eight hundred and fifty-six, or 2.12 per cent, were rejected because of pulmonary disease as revealed in the photoroentgenogram, of which 632 were for tuberculosis and 224 for nontuberculous pulmonary diseases. Approximately 40 per cent of the men rejected were deferred temporarily. Thus of the 632 cases rejected for tuberculosis 258 were temporarily deferred in order to determine the stability of the lesion. The rejection rate for tuberculosis varied considerably, the oldest group showing the highest rate and the youngest group the lowest. The high rate among the older men was the result of a greater prevalence of arrested tuberculosis. Comparison of the rates of rejection obtained at the Buffalo induction station with those observed in the southern New York recruiting district showed essentially the same rejection rate for active tuberculosis in the two localities. The greater prevalence of arrested tuberculosis in the Buffalo region was attributed to the generally older age level of the men examined.

### Annals of Surgery, Philadelphia

**123** 161-320 (Feb.) 1946

Vascular Injuries of Extremities in Battle Casualties. C. A. Rose, O. W. Hess and C. S. Welch.—p. 161.
Penetrating Head Wounds: Experiences from Italian Campaign. R. A. Munslow.—p. 180.

*Pulmonary Embolism: Statistical Study with Particular Reference to Value of Certain Preventive Measures. C. R. Lam and D. H. Hooker.—p. 221.
*Congenital Cystic Lung: Successful Pneumonectomy in a Three Week Old Baby. R. E. Gross.—p. 229.
Delayed Internal Fixation of Compound Battle Fractures in Mediterranean Theater of Operations: Case Histories with Illustrations, Follow-Up Study in Zone of Interior. O. P. Hampton, Jr.—p. 238.
*Surgical Significance of Accessory Spleen. G. M. Curtis.—p. 276.
Biliary Ascariasis: Report of 19 Cases. S. C. H. Yang and P. J. Laube.—p. 299.
Sympathectomy for Ischemia Following Femoral Artery Ligation. R. R. Crutcher.—p. 304.

**Pulmonary Embolism.**—Lam and Hooker made a study of the fatal and nonfatal embolic complications which occurred in 118,611 operations performed at the Henry Ford Hospital in Detroit in the twenty-one year period between 1924 and 1944. Two hundred and eighty patients had pulmonary emboli, of which 78 were fatal. The diagnosis was established at necropsy in 70 per cent of the fatal cases. Both fatal and nonfatal embolism occurred more frequently in men than in women, the ratio being about 3:2. All embolic episodes occurred most frequently in the fifth decade, while fatal embolism was noted oftenest in the sixties. It was expected that abdominal operations would show the complication frequently and head and neck operations not at all. This proved true. Gastric operations and prostatectomy were the worst offenders. There is no report of a successful Trendelenburg operation in this country. Almost half of the patients in this series died in less than ten minutes, three-fourths died in less than half an hour and only 10 per cent lived more than hour. Theoretically it would be possible to operate on only a fourth of the patients. Since the adoption of anticoagulant therapy and prophylactic femoral vein ligation there has been a very low mortality rate in cases selected for

treatment However, these measures have not prevented a number of sudden and unexpected fatal embolisms Early ambulation offers the most promise as a preventive measure easily applicable to the majority of surgical patients

**Successful Pneumonectomy in a Three Weeks Old Baby for Congenital Cystic Lung**—Gross reports that a 3 weeks old baby with congenital cystic disease of the left lung withstood total pneumonectomy in a satisfactory manner and has had an uncomplicated postoperative course

**Surgical Significance of Accessory Spleen**—Curtis and Moritz present a list of diseases for which 174 consecutive splenectomies and 4 abdominal explorations were done In this series of 178 consecutive patients operated on for various splenic diseases 56, or 31 4 per cent, presented accessory spleens The 50 per cent incidence in the first decade as well as the 39 1 per cent in the second decade is even greater than the increased incidence of accessories ordinarily found in the young with "normal" spleens The decreasing incidence with advancing age is presumed to occur normally by gradual involution and atrophy The onset of a pathologic process in splenic tissue apparently causes the accessory to remain and thus occurs the increased frequency of accessories in those with certain splenic diseases The greatest incidence of accessories was 57 1 per cent in the first decade in congenital hemolytic icterus Save for the third decade, the incidence of accessories in congenital hemolytic icterus is greater than in primary thrombocytopenic purpura The number of accessories per patient varied from one to ten. The presence of splenules throughout the peritoneum appears to be a different clinical entity from true accessory spleens and is now known as splenosis They are to be differentiated because (1) they originate by transplantation of fragments of splenic tissue, usually scattered about the peritoneum by hemorrhage from a ruptured spleen, (2) they usually occur in great numbers, reportedly varying from 42 to 400 and (3) they are diffusely distributed throughout the peritoneum The occurrence of splenosis is closely related to splenectomy To avoid overlooking accessory spleens a routine search is made, after the major spleen has been removed, in the following approximate order (1) hilar region, (2) splenic pedicle, (3) retroperitoneal region surrounding the tail of the pancreas (4) the great omentum and especially along its attachment to the greater curvature, (5) colic ligamentary attachments, (6) mesentery of both large and small intestine and, (7) in the female, the left adnexa The two recurrences thus far observed in this series of 174 consecutive splenectomies are reported in detail, 1 with primary thrombocytopenic purpura and the other a striking case in which recurrence of congenital hemolytic icterus was relieved by removal of two accessory spleens at a second operation Pedunculated accessory spleens may cause acute abdominal symptoms from infarction due to pedicle torsion This is shown in 2 such case reports

## Archives of Internal Medicine, Chicago

**77** 121-236 (Feb) 1946

Progressive Bilateral Bullous Emphysema A. H Price and G Teplick—p 132
*Fulminating Meningococcemia with Vascular Collapse (Waterhouse Friderichsen Syndrome) Report on 4 Adult Patients Who Recovered D O Wright and L. B Reppert—p 143
Atypical Hemolytic Anemia Observations with Particular Reference to Use of Transfusions in Study of Hemolytic Mechanisms L E. Young and J S Lawrence—p 151
Absorption, Distribution and Excretion of Streptomycin. J D Adcock and R A Hettig—p 179

**Recovery in Fulminating Meningococcemia**—Wright and Reppert report 4 nonfatal cases of fulminating meningococcemia with severe vascular collapse which were clinically indistinguishable from cases of the Waterhouse-Friderichsen syndrome. The patients were adults Treatment consisted in administration of sulfadiazine, large amounts of plasma and fluids intravenously to combat the critical vascular collapse and adrenal cortex substance. Deductive evidence suggests that hemorrhagic destruction of the adrenal glands is not the primary cause of death Early clinical diagnosis and prompt institution of therapy without waiting for laboratory aid are imperative

## Archives of Ophthalmology, Chicago

**35** 71-198 (Feb) 1946

Basket Type Implant for Use After Enucleation N L. Cutler—p 71
*Uveal Blastomycosis J V Cassady.—p 84
Acid Burns of Eye J S Friedenwald, W F Hughes Jr and H Herrmann—p 98

Corneal Transplantation and Preliminary Iridectomy C I Thomas—p 170
Contact Eye Cup for Corneal Baths with Solutions of Penicillin G C Struble and J G Bellows—p 173

**Uveal Blastomycosis**—Cassady observed a man aged 64 who was admitted to the hospital with polyarthritis of six months' duration and cutaneous lesions of six weeks' standing There was a generalized papular disease of the skin, with some pustules covered with large scabs The right pupil was sluggish and small The temperature varied from 99 to 100 F almost every afternoon but was normal in the morning Sometime later he complained of severe pain in his right eye The lesions over the trunk were in various stages of evolution, healing with violaceous, atrophic scars Biopsy of the skin revealed numerous giant cells in which double, refractile, yeastlike bodies were seen They were thought to be Blastomyces hominis, typical of blastomycosis of the skin Roentgenograms of the right knee, tibia and fibula and the right side of the skull revealed irregular areas of destruction without reaction of the bone around the lesions The appearance and location of the lesions in the bone, together with the type of lesion in the lungs, favored the diagnosis of blastomycosis The patient had severe photophobia, moderate injection of the ciliary body of the right eye, a total posterior synechia and a small, fixed pupil At 8 o'clock on the free margin of the iris was a yellowish tubercle-like nodule Extending into the angle of the anterior chamber at the limbus was another yellow tubercle-like lesion Paracentesis of the anterior chamber and examination of the aqueous for blastomycetes gave negative results Necropsy revealed blastomycotic iridocyclitis, cataract and secondary glaucoma The anatomic diagnosis was blastomycosis involving the skin, lungs prostate gland, kidneys, bone and eye

**Congenital Defects of Eye and Vitamin A Deficiency**—Warkany and Schraffenberger found that when female rats were raised and bred on a dietary regimen which led to extreme vitamin A deficiency during pregnancy there were congenitally deformed offspring These newborn rats had various defects of the skeleton and of some of the soft tissues Study of histologic sections of the eyes revealed a fibrous retrolenticular membrane in place of the vitreous in every specimen In addition there were frequently colobomas, eversion and abnormal structure of the retina, rudimentary development of the iris and of the ocular chambers, defects of the cornea and of the conjunctival sac and lack of fusion of the lids With the last mentioned defect the abnormal eyes could be recognized by external inspection When the maternal diet was supplemented with vitamin A during pregnancy, the eyes of the young were normal

**Effect of Triethylene Glycol Vapor in Hospital Wards**—Early laboratory studies on the bactericidal action of glycol vapors revealed that maximum efficiency is obtained at relative humidities between 40 and 60 per cent Equally effective killing could be achieved at lower humidities only when higher concentrations of glycol were employed Later, certain observations in hospital wards suggested that an appreciable bactericidal action may be exerted by triethylene or propylene glycols when the relative humidity is as low as 35 or even 25 per cent Hamburger and his associates have found that the bactericidal effect of triethylene glycol vapor on air borne hemolytic streptococci in hospital wards at relative humidities of 18 to 32 per cent is substantial, though the reductions are less than those achieved when the humidity is maintained at 40 to 50 per cent The effect has been noted both on streptococci liberated into the air during bed making and on those present during "quiet periods"

**Susceptibility of Vervet Monkeys to Poliomyelitis Virus in Flies**—Melnick and Ward tested flies trapped in four epidemic areas in 1943 and 1944 for poliomyelitis virus in vervet (Cercopithecus ethiops pygerythrus) monkeys from East Africa Eleven of this species of monkey were used for the tests Experimental poliomyelitis was produced in 2 vervet monkeys inoculated with flies from two of these epidemic areas urban Chicago and rural North Carolina This indicates that another experimental host, at present more available than cynomolgus or Java monkeys, is susceptible to poliomyelitis virus in flies

**Hodgkin's Disease in Children**—Charache reports 11 cases of Hodgkin's disease in white children from 3 to 15 years of age, observed at the Brooklyn Cancer Institute from 1930 to the present Seven of the patients were boys and 4 were girls Three of the patients were one of homologous twins without the other twins being affected The mother of one of the twins died from Hodgkin's disease Of the 11 cases, 8 originated in glands of the neck, of these, 4 originated on the right side of the neck and 2 on the left side, 2 were bilateral In 1 case there was general adenopathy, 1 originated in the left axilla and in 1 there were primary skeletal manifestations Six patients had an enlarged spleen and 4 an enlarged liver on admission Eight had mediastinal involvement There was mild eosinophilia in 4 cases One presented 5 per cent eosinophils One of the cases showed a terminal leukocytosis of 26 000, while 2 cases presented a terminal leukopenia A moderate leukocytosis was present in the rest of the cases Roentgen therapy was administered in all cases This is the treatment of choice, although some localized lesions may lend themselves to complete surgical excision The duration of life since the onset of the disease in 8 cases that could be followed was 19 75 months Hodgkin's disease in children is comparatively rare The only positive diagnosis is based on the microscopic study of an excised lymph node from the cervical or axillary region Inguinal nodes are often associated with infection and do not always give a true picture of Hodgkin's disease. The prognosis of Hodgkin's disease in children is even more grave than in adults

**Death and Illness from Use of Carbon Tetrachloride**—Four men were assigned to clean the glue off a newly laid "masonite' floor covering All soap solutions being unsatisfactory, one of the men suggested use of carbon tetrachloride as a solvent. Two 5 gallon cans of commercial carbon tetrachloride were issued to the workmen, who used it to scrub the floor, working on their hands and knees Rubber gloves were issued to protect their hands The job required the afternoon of one day and the forenoon of the next (a total of eight hours), after which the crew worked that afternoon waxing the same floor The survivors did not believe they spent more than two thirds of the eight hours in actual working, the remainder being spent outside in the fresh air As carbon tetrachloride is about five times as heavy as air, the heaviest concentration was on the floor, where the men were working, and probably exceeded the limit for acute poisoning of 1 000 to 1,500 parts per million of air One patient had only a mild headache, a

second had insufficient exposure to be affected. The third patient developed headache, nausea, vomiting, diarrhea, vertigo and abdominal tenderness. Gastrointestinal disturbances persisted for a week, and anorexia, lassitude and mild headache persisted for another week. This patient lost 25 pounds (11 Kg.). The fourth patient died and the postmortem revealed acute hemorrhagic nephritis, acute toxic myocarditis with failure, bilateral hydrothorax, toxic splenomegaly and fatty degeneration of the liver.

**Therapy of Psoriasis.**—Schonberg observed 207 cases of psoriasis among 7,000 dermatologic cases in a military hospital. In 35 of the patients the psoriasis was of such severity that hospitalization seemed advisable. Two of the patients had psoriasis guttata, whereas all the others had psoriasis vulgaris. The author gained the impression that the various types of parenteral and enteral medication were of no apparent value in this series of cases. Exacerbations were most prevalent where infiltrated patches remained. Dietary measures were of questionable value. Autohemotherapy seemed to benefit only the acute cases of psoriasis guttata. Genital and intertriginous nail and scalp lesions were most resistant to therapy. Nail lesions did not respond to any measures. Although there was some evidence of familial tendency in several of the cases, no definite conclusions could be drawn. The best method of therapy is external. A soap suds soak and keratolytic preparations were employed for the first few days of treatment. This was followed by a 5 per cent crude coal tar ointment in conjunction with ultraviolet as suggested by Goeckerman. Residual lesions were treated with 1 to 3 per cent chrysarobin and ultraviolet. Certain cases of psoriasis will not be influenced by therapy of any kind.

**Surgery of Thymus.**—Of Keynes's 51 patients subjected to thymectomy, 6 had tumors one of which was infiltrating the pericardium, pleura and lung and was judged to be inoperable. The patient died soon after the operation. The other five tumors were apparently benign, though their thick capsules were densely adherent to the pleura covering them and to the pericardium thereby increasing the difficulty of removal and the risk of the operation. One of the 5 patients with benign tumors died after the operation from pulmonary atelectasis. The other 4 survived the operation but 2 of them after improving greatly for a time had severe relapses of myasthenia and died within three months of respiratory failure. Only 2 of the 6 tumor patients are alive today. 1 two years later is much better than before the operation. The other was operated on only recently. Of the 51 patients operated on 13 are dead and 38 are alive. Of the 13 fatalities only 8 can be called operative deaths. Of the 33 patients available for a postoperative follow-up 9 are well, 11 are greatly improved, 8 are somewhat improved and 5 show no improvement.

Penicillin in Gonorrhea. Single Injection Method. A. Allan.—p. 314
*Traveler's Edema. K. Zacopoulos.—p. 322

**Acroparesthesia in Lower Limbs.**—Martin reports several cases of acroparesthesias in the lower limbs in men. The tingling is usually described as being in the muscles and is relieved by muscular activity, but the burning sensation in the feet, if present is superficial and is relieved by putting the foot against something cold. The sensation is the same as that of acroparesthesia in the upper limbs. Not only is the quality of the sensation the same, but both in the upper and in the lower limbs the sensation occurs in sleep, if severe, it awakens the sufferer, and it is relieved by the same means by putting the affected parts out into the cold, holding them up and exercising

them. Furthermore, in many cases physical exercise taken during the day in bringing about this peculiar discomfort at night is similar in the two instances. The association of these paresthesias with exercise and sleep is puzzling. Paresthesias of the leg are frequent features of the early stages of organic nervous diseases due to dietary deficiencies. They occur also in subacute combined degeneration of the spinal cord in polyneuritis and in other organic nervous diseases. Paresthesias are also seen in some cases of vascular occlusion and in "immersion feet" in which there is a combined nervous and vascular effect. However, in 1 of the author's patients even after forty years of paresthesias at night, no signs of organic nervous or vascular disease could be discovered, nor were such signs seen in the other patients. The author has found acetylsalicylic acid most serviceable in relieving these paresthesias.

**Traveler's Edema.**—Zacopoulos directs attention to a form of edema caused by inactivity to which travelers by sea, rail or road are subject. Among 40 Greek officers who, while escaping to Aleppo, Syria, had an uncomfortable, crowded trip lasting four days, there were 8 who developed edema of the ankles. Another group of Greek officers had to stand for the better part of three days during a journey from Smyrna to Aleppo. Extensive edema had appeared in the lower extremities of every member of this group toward the end of the second day of the journey. None of these men had suffered from excessive malnutrition. It was not a cardiac edema because careful examination of the cardiovascular system revealed no abnormality. It was not a renal edema, because none had pyrexia, renal pain, oliguria, edema of the eyelids or any other symptom of nephritis. 'Deck ankles' probably represent the same condition. He prefers the term traveler's edema to either inactivity or orthostatic edema. Traveler's edema is caused purely mechanically in cases in which there is a great diminution or complete absence of muscular movements of the extremities in persons who are sitting or standing for prolonged periods. Treatment is simple. Repeated active or passive movements of the lower extremities must be started immediately. Tepid bathing of the feet is advisable, with simultaneous massage and passive movements of the toes, ankles and calves. An elastic stocking might be tried in those few cases which do not respond promptly to massage and tepid baths. Travelers must be warned against complete inactivity and whenever possible must avoid standing up during long journeys.

**Protein Hydrolysate in Infective Hepatitis.**—Viswanathan studied 54 cases for the purpose of assessing the value of protein hydrolysate, 27 were treated with the protein digest, while the remaining formed controls. He concludes that protein hydrolysate has definitely a place in the treatment of infective hepatitis with toxic symptoms. Vomiting disappears and appetite is restored quickly. The liver becomes normal within a shorter period. The degree of jaundice is not appreciably affected in the majority of cases. The sedimentation rate comes down to normal in a shorter time. Better results are obtained in those treated early. He is inclined to believe that if the treatment is instituted in the preicteric or the early icteric stage the results will be more favorable.

## Semaine des Hôpitaux de Paris

Minor Form of Paroxysmal Arterial Hypertension Caused by Adrenal Hyperactivity in the Absence of Tumor. C. Lian, H. Welti and F. Siguier.—p. 15

**Teleroentgenographic Demonstration of Adrenal Capsules.**—Complete absence of gas in the adrenal area after an enema and after restriction of food and beverages on the eve of the teleroentgenographic examination should first be verified by radioscopy. The patient then is placed in a vertical position with the back against the plate. The x-ray tube must be centered on the eleventh intercostal space so that the normal incident ray is tangent to the superior pole of the adrenals. The teleroentgenogram should be made at a distance of 1.5 meters during expiration, with a radiation of about 80 kilovolts. The time of exposure should be the shortest the apparatus permits. By using this method in 3 cases of adrenal hypertrophy, Lian and his associates succeeded in demonstrating not only the size of both adrenal capsules but also their contours. An irregular hypertrophy is manifested by sharp outlines, while the visible superior pole of the capsule appears circular instead of oval. A regular hypertrophy i. e. a simple hyperplasia, is indicated by smooth outlines, while the superior pole of the capsule shows the roentgenographic oval. Very slight anomalies can be demonstrated by this method where others may fail.

Dysontogenetic Tumors of Renal Cortex. R. Escobar Pires.—p. 183
Adrenal Problem in Tropical Pemphigus. J. R. Alves Guimaraes and J. P. B. Vieira.—p. 229

**Penicillin in Tabes Dorsalis.**—Sales Gomes administered penicillin to a man aged 78 with tabes dorsalis of two years' duration. The patient had paralysis of the lower extremities, lightning pains, gastric disturbances and urinary incontinence and was in poor general condition. Tabes had become manifest more than fifty years after the syphilitic infection. Penicillin was injected daily for seven days into the spine. Simultaneously penicillin was administered by intramuscular injection for ten days. The total doses were 297,500 units intrathecally and 812,500 intramuscularly. At the termination of this treatment the patient had a severe gastric crisis, which probably resulted from the intense alkalization with the sodium penicillin and the large quantities of dextrose solution. Several weeks after the penicillin therapy the lightning pains were relieved by about 75 per cent in frequency and intensity, urinary incontinence and gastric disturbances disappeared and the general condition improved greatly. There was a return of some of the reflexes.

# Book Notices

**Diseases of the Nose Throat, and Ear Including Bronchoscopy and Esophagoscopy** Edited by Chevalier Jackson M D Sc D LL D and Chevalier L. Jackson M D M Sc F.A C S Professor of Broncho Esophagology Temple University Philadelphia With the Collaboration of Sixty Four Outstanding Authorities Cloth Price $10 Pp 844 with 934 illustrations Philadelphia & London W B Saunders Company 1945

This new textbook is a welcome addition to a field in which new conceptions of pathogenesis and therapy have been rapidly accumulating as horizons have expanded Since however it is for the most part a compilation of the work of some sixty-four contributors, it is natural that one will note differences in style and emphasis This is apparant as one peruses the text and it detracts considerably from the fluidity and continuity which can come only from the pen of a single author Also one will find that certain topics are overstressed to the disadvantage of others which are not too thoroughly covered However, on the whole one may say that the material is adequately presented Special mention should be made of the chapters covering the otologic and laryngologic subjects, which are given in great detail with clarity and authority Also one will note with pleasure the inclusion of such topics as trauma involving the sinuses and facial structures as well as plastic repair of nasal and aural defects There is much that is new in the book, such as chapters on aviation otology, photography of the air passages therapy and anesthesia. Also the discussions of the various neuralgias and psychosomatic problems affecting patients with laryngologic symptoms are timely additions On the other hand, one cannot help but note the absence of any special treatment of the subject of sinusitis in children and the meager coverage of the subject of tonsillectomy, in which a surgical procedure is described that is not representative of the one more generally practiced, also it is regrettable that the subject of nasal allergy is given so little space. Nevertheless the book is well worth while, since in one volume it is comprehensive enough to serve the needs of the average practitioner A large number of excellent illustrations properly labeled and distributed help materially to illuminate the text.

**Colloid Chemistry Theoretical and Applied** By Selected International Contributors Collected and Edited by Jerome Alexander Volume VI General Principles and Specific Industries Synthetic Polymers and Plastics Cloth Price $20 Pp 1,215 with illustrations New York Reinhold Publishing Corporation 1946

This is the last of a six volume series published over a period covering the past two decades (volume I, 1926) that deal with various phases of colloid chemistry The series covers a diversity of scientific interests represented by the contributions of numerous authorities in the field that have been collected and edited by the author Volume V Theory and Methods, Biology and Medicine, reviewed in THE JOURNAL, June 23, 1945 illustrates the wide range of application that colloid chemistry has engendered

The present volume, as suggested by the title, is divided into two sections part I dealing with general principles and specific industries, and part II, dealing with synthetic polymers and plastics In addition, at the end there are three appendixes, a special table of dimensions and the usual author and subject indexes The two main parts comprise 71 papers—38 in the first, 33 in the second. The appendixes consist of three brief supplements to papers in the main body of the book, two of which supply additional information concerning the commercial production of synthetic rubber and penicillin that was withheld from publication during the war The editor has himself contributed a general article on nuclear fission and atomic energy that appears as the last of the papers in part I and serves admirably to provide timely information on this important topic

The book for the most part contains papers on subjects of primary interest to the chemist and physicist particularly with respect to the application of colloid chemistry to industrial and technologic methods involved in processes or products of manufacture A few of the papers are theoretical, but most of them are of practical interest to persons engaged in scientific methods of production. Of technical interest to those engaged in the medical sciences are the papers in part I on electron microscopy and the skin and its technologic hazards (The previous volume of the series contained in its second part much more information on the applications of colloid chemistry to medicine) The other papers of this section cover a wide variety of subjects from the surfaces and nature of solids, adhesives and drilling fluids to the colloidal activity of greases, metals, soaps and paints

Part II of the book is introduced by another contribution of the editor on the behavior of plastics The other papers of this section (except the last on nuclear fission) are devoted almost entirely to the industrial chemical aspects of celluloses, resins, plastics and other synthetic polymers These should be of special interest to those engaged in the development of new structural materials or methods of improving synthetic materials already in use.

The contributors of the various papers constitute an imposing list of authorities too lengthy to supply in detail Among those represented, in addition to the editor, may be mentioned William D Harkins, Norman D Coggeshall J K Zworykin E A Hauser, Lawrence H Flett Joseph Stanley Alfred E Gutman R W Albright, Hans F Winterkorn, C K Tseng, Frank C Combes, W A Helbig, A E Young, Alan F Randolph and James R Patterson The papers are arranged so that each together with its list of references, forms a chapter of the book The editor has successfully arranged the order of the chapters to attain a high degree of organization of the greatly varied topics presented The editing has also been well done, as evidenced by the comparative freedom from typographic and other sources of error peculiar to a work of this kind.

Viewed as a whole, this book should prove to be a valuable reference to the industrial chemist, chemical and technologic libraries, as well as for those interested in so-called pure science

**Pensée de Pasteur** Par Charles Oulmont Paper Pp 103 Lisbon L'Instituto Pasteur de Lisboa 1945

With sympathy and a delicate touch, the life and mind of Pasteur are sketched from the time when the sensitive boy of 13 divided his interest between his studies and his portraits in pastel of Arbois neighbors through the labors and triumphs of his work on fermentation and infectious diseases the establishment of the germ theory and the development of vaccine therapy labors only partly interrupted by the attack of paralysis which seemed to threaten his career at its height But this is not a recital of dramatic success the author's affectionate admiration is compelled by the character of the man, his loving-kindness his determination his invincible integrity his deeply religious outlook in science and life alike 'My philosophy is all of the heart and not of the mind" The relentless investigator who asked for eloquence in facts and not in words masked the devoted son and the tender father and to the long loved companion sweetheart and wife, he gave his humble and honest pledge— I belong to you and to Science for all my life."

This is a perfect example of G Stanley Hall's higher ideal man', He will merge and perhaps efface himself in his cause or task, although greatest he will be content to be thought least he will be vastly more naive than self conscious and will place the good of others before that of himself

**Rehabilitation at Lake Tomahawk State Camp A History** By Harold Holand Director Research Department Wisconsin Anti Tuberculosis Association Cloth Price $1 Pp 46 with 6 illustrations New York National Tuberculosis Association 1945

This book deals with the Lake Tomahawk State Camp for the rehabilitation of the tuberculous operated by the state of Wisconsin at Tomahawk Lake in the northern forest area of that state The book gives an account of the establishment of the institution and a description of its general character and of its working plans It gives also careful statistical studies of the result of rehabilitation For the most part these results have been favorable, but there has been a certain percentage of reentry into the sanatorium among the patients who have been treated or perhaps one had better say rehabilitated at the Tomahawk Lake Camp This percentage is smaller than the percentage of patients who have been readmitted to sanatoriums without the advantages of such rehabilitation as at Tomahawk Lake. The book contains information of value to those interested in the rehabilitation of the tuberculous especially those who may be planning camps and other rehabilitation projects

# Queries and Minor Notes

THE ANSWERS HERE PUBLISHED HAVE BEEN PREPARED BY COMPETENT AUTHORITIES THEY DO NOT HOWEVER REPRESENT THE OPINIONS OF ANY OFFICIAL BODIES UNLESS SPECIFICALLY STATED IN THE REPLY ANONYMOUS COMMUNICATIONS AND QUERIES ON POSTAL CARDS WILL NOT BE NOTICED EVERY LETTER MUST CONTAIN THE WRITER'S NAME AND ADDRESS BUT THESE WILL BE OMITTED ON REQUEST

## NEUROVASCULAR SYNDROME OF ARMS DUE TO HYPERABDUCTION

*To the Editor*—A white man aged 33 has had weakness of the hands for sixteen years associated with tingling and numbness on exercise These symptoms are relieved by rest or by allowing the arms to remain pendent for some time Elevation of the arms produces tingling of the hands Examination reveals some reddening of the skin and slight thickening of the hands The lower extremities are not involved at all Complete neurologic examination is negative The patient's mother has been subject to the same disorder for over thirty years Although the more gross neuropathies have been considered such as disseminated sclerosis syringomyelia, cord tumor cervical rib scalenus anticus syndrome and the neuritides corroborative evidence has not been found The symptomatology does not resemble any of the ordinary vascular diseases

Sidney N Mandell M D Union City N J

ANSWER—The syndrome as explained in the query suggests one of the neurovascular syndromes produced by pressure or torsion of the blood vessels and nerves between the posterior surface of the clavicle and the anterior surface of the first rib, and accentuated with hyperabduction of the arms due to torsion and pressure behind the pectoralis minor and underneath the coracoid process The subclavian axillary artery is frequently involved in one or both of these areas as well as the nerves of the brachial plexus

A complete description of this type of syndrome is to be found in the paper by I S Wright (*Am Heart J* **29** 1 [Jan.] 1945) The patients described in that paper developed their syndromes for the most part as a result of sleeping with the arms in the hyperabducted position In 1 instance this progressed to the point of gangrene of the fingers A study of 150 young adults revealed that a pulse of the arm can be obliterated in the position of hyperabduction in approximately 83 per cent of all normal persons, although in some instances this is difficult Some individuals were seen whose radial pulses disappeared when the arms were abducted beyond the 90 degree angle in the median plane

Patients have been seen in whom these syndromes are produced by their occupation These include painters and riveters of the undersurfaces of airplane wings Attention should also be called to the article by M A Falconer and Graham Weddell (*Lancet* **2** 539 [Oct. 30] 1943), which describes a similar syndrome produced by downward and backward pressure of the clavicle against the first rib It was noted in soldiers of the British army who wore heavy packs This syndrome can also be produced by relaxation of the muscles which normally support the clavicle, provided the shapes of the clavicle and the first rib are such that they encourage easy obliteration of the normal space of that area

If the syndrome is produced by hyperabduction, this should be avoided Those who sleep in such a position must be trained to sleep with their arms by their sides Those in whom an occupational factor is important must readjust their employment In other instances it is necessary to use exercises to develop the muscles responsible for holding the clavicle in the proper position Falconer and Weddell described surgery involving the production of a groove by operation on the first rib This will probably not be necessary for many patients A table of differential diagnosis regarding these neurovascular syndromes is included in the paper by Wright.

## DERMATITIS FROM 'SIZES'

*To the Editor*—A man has developed a dermatitis of the face and hands while working at sizing straw hats I believe that the sizing consists of a coal tar nitrocellulose and ethyl butyl Please send me any information pertaining to the cause prevention and treatment of the dermatitis I would appreciate if you could also check on the composition of the sizing

M D New York

ANSWER—Dermatitis from "sizes" may be the result of primary irritation from the solvent contained in the size. Such a dermatitis will result if the hands are frequently soiled with the size, especially in thin, dry skinned persons

The stiffener in the size may be a natural or a synthetic resin Natural resins such as rosin, manila gum and shellac are used Synthetic resins such as ethyl cellulose and nitrocellulose may also be used, as may sodium silicate, or water glass Usually there is some alkali content in the size, especially if a natural resin is used, and there is considerable water in the solvent No formulas for size containing coal tar have been found in the available technical books

Dermatitis of the face from sizing usually occurs because the soiled fingers are applied to the face in scratching and other unconscious movements, very much as is the case with nail lacquer dermatitis.

In order to ascertain which ingredient in the size is the actual cause of the dermatitis, it is suggested that patch tests be performed with each of the ingredients except the solvent. This can be done by ascertaining the ingredients from the manufacturer If the ingredients cannot be ascertained from the manufacturers, some of the size may be applied to a piece of gauze 1 inch square and allowed to dry The gauze can then be applied as a patch test on the patient. This will give information as to whether the solid ingredients or the solvent are the actual cause of the dermatitis Dermatitis from the solid ingredients is on an allergic basis, whereas dermatitis from the solvent is primary irritation

Prevention of dermatitis in the case under question will consist in avoiding soiling the hands with the size either by wearing rubber gloves or by using long handled brushes for applying the size, depending on how the work is performed The patient should be warned to keep soiled hands or even soiled gloves off the face The frequent washing of soiled hands during the day is also a useful preventive measure

Treatment of the condition consists in preventing further contact and applying mild medicaments such as wet dressings of Burow's solution 1 20, if the dermatitis is acute and vesicular, or using mild ointments such as zinc ointment or even a simple emollient cream if the dermatitis is of the chronic dry type.

## SEVERE PRURITUS IN RETURNING VETERANS

*To the Editor*—A number of returning veterans have come under my attention seeking relief from a rather severe urticaria They state that on leaving Europe as far as they knew their condition was normal About seven days after leaving European shores this seven day type of urticaria began to manifest itself There are no skin manifestations except excoriations due to scratching I have been giving the patients intravenous calcium gluconate and vitamin B complex and soothing baths but treatment has not been long enough to expect results Can this condition be a contact dermatitis a food allergy or a neurologic mechanism? What therapy would best facilitate improvement?

Michael G Frich M D Monessen Pa

ANSWER—"Urticaria" without skin manifestations developing after seven days in the crowded troop ships might be merely itching due to the crowded conditions, the stuffy hot air and the lack of bathing facilities Another possible factor might be the diet with irregular feedings and irregular bowel function as well as the general nervous excitement Treatment should be directed toward each of these factors and that means cleanliness, rest, pleasant peaceful surroundings, fresh air and a good general diet

## SEX DIFFERENCES IN STILLBIRTH RATES

*To the Editor*—Is there any truth in the statement that 'some women cannot carry a boy baby until birth'? If there is any truth in this statement what would be the possible reason?

M.D Kansas

ANSWER—There is absolutely no truth in the statement quoted. Perhaps it is based on the fact that whereas the ratio of males to females at birth is 105 to 100, the stillbirth rate is about 130 males to 100 females and the sex ratio for early abortions is about 160 males to 100 females

## ALTITUDE AND HEART DISEASE

*To the Editor*—Regarding the query in The Journal April 6 1946, page 981 on altitude and heart disease I have no quarrel with the answer to the question from an academic standpoint—it was my assignment during the war to be director of the Altitude Training Unit at Yuma Army Air Field and during the war I supervised some 50 000 men at simulated altitudes at several air fields During this time we all observed factors which are not explained by alveolar oxygen tensions—in fact none of the research explanations of the A. A. F satisfactorily explained all the effects of altitude simulation Not all of the unusual effects of decompression were limited to very high altitude simulation I have had experiences with older officers and enlisted men at altitude simulations of 6,000 to 8,000 feet which convinced me that patients such as the one discussed would be benefited by both (1) increasing oxygen tension in the room and increasing atmospheric pressure in the room I am not discussing practicability It would obviously be easier to move to sea level However I am convinced that the patient would receive material and evident clinical comfort from a pressurized room—comfort that a simple increase in oxygen would not give

## AN OUTBREAK OF POLIOENCEPHALITIS AMONG NAVY CADETS, POSSIBLY FOOD BORNE

LIEUTENANT COLONEL DAVID M GOLDSTEIN
*Medical Corps Army of the United States*
W McD HAMMON M D Dr P H
San Francisco
and
HENRY R VIETS M D
Boston

During the first week of September 1943 at a naval training school situated on the campus of a West Coast civilian educational institution 14 cases of clinical poliomyelitis developed These cases were observed, diagnosed and treated at a nearby army station hospital At the same time 3 other paralytic cases occurred at two navy flight training fields in an adjoining state among graduates who had left the aforementioned training school less than six days before the onset of symptoms Another paralytic patient the girl friend of 1 of the graduate patients, who had attended the school commencement also became ill at the same time as the others It is considered that the source of infection was probably common to all 18 clinically diagnosed cases In addition to this group of recognized cases there were several others hospitalized as suspect cases and discharged when spinal fluid tests were found negative It was later learned that about 100 other cadets were ill with suggestive symptoms during this period They did not report to "sick bay" however, since all suspects were being hospitalized, and these mildly ill students feared that loss of time might compromise their chances of qualification for flight training Among 30 graduates who went to one training field, 6 men in addition to the 2 who were paralyzed were found to have been sick and off duty at least two days in the second week of September with undiagnosed illness which, by reported symptoms, might well have been abortive poliomyelitis None of the men at this field however from groups graduated from other schools, were ill during the same week The investigation at this field was carried out when one of us (W McD H [1]) was asked by the civilian physician caring for the 2 paralytic cases to see them as a consultant No investigation was carried out at the other flying fields to which graduates from the training school had gone One paralytic patient included among the 3 graduate cases was eventually reported from one of these fields During the following several weeks no other cases could be discovered from the school or any of the fields known to be involved Thus there is clinical evidence of an explosive epidemic of poliomyelitis infection among young adults which probably involved over 100 persons All appeared to have a common source of infection and not a single secondary case of even a mild nature was found Epidemiologic evidence is suggestive that some food served in the mess hall at the school, probably milk was the source

One unusual feature of the outbreak was the preponderance of cases with encephalitic manifestations Paralyses were limited almost entirely to muscles supplied by the cranial, cervical and thoracic nerves For this reason and because of the unusual epidemiologic picture, the diagnosis of poliomyelitis was not made immediately Serologic tests done at the George Williams Hooper Foundation of the University of California (Army Consultant's Laboratory) and at the Virus Laboratory of the U S Army Medical School ruled out western equine, St Louis and Russian spring-summer encephalitis The feces of 3 of 4 patients tested by monkey inoculation by Mr Walter N Mack, member of the staff of the former laboratory, yielded strains of poliomyelitis virus

Because of the lack of naval hospital facilities in the immediate area, all patients were hospitalized at the nearby army hospital in charge of one of the authors (D M G) Major Ralph Rosenberg, M C and Capt Anthony Coletti, M C, officers on the medical service, were principal assistants in the work The post surgeon requested consultation from Washington, and one of us (W McD H) as a consultant to the Secretary of War on the Commission for the Investigation of Influenza and other Epidemic Diseases, Committee on Neurotropic Virus Diseases of the Surgeon General's Office, was requested to make an investigation This was begun on Sept 16, 1943 The senior naval medical officer of the school cooperated in a study of the campus and furnished information in regard to the early symptoms of the patients Eventually, because of remaining differences of opinion in regard to diagnosis, at the request of the army consultant, the post surgeon, Col C G Hutter, M C, U S Army (deceased June 26, 1945) invited another of the authors (H R V), chairman of the Diagnosis Committee of the National Foundation for Infantile Paralysis, to see the patients Also on October 9, on the recommendation of the consultants, Dr Frances Baker and Miss

From the George Williams Hooper Foundation University of California (Dr Hammon)
Lieutenant Colonel Goldstein's present address is 657 South St Andrews Place Los Angeles 5 Dr Hammon's Hooper Foundation University of California San Francisco 22 Dr Viets's 20 Gloucester Street Boston 15

This investigation was carried out in collaboration with the Commission on Neurotropic Virus Diseases Board for the Investigation and Control of Influenza and Other Epidemic Disease in the Army Preventive Medicine Division, Office of the Surgeon General U S Army Aided by a grant from the National Foundation for Infantile Paralysis

1 While on a lecture tour for the National Foundation for Infantile Paralysis

Marjorie Wagner of the department of physical therapy of the University of California Hospital, made muscle analyses of all patients

A number of outbreaks of poliomyelitis in which milk was suspected to be the principal agent have been reported in the past In West Kirby, England, in 1914, 4 scattered cases of poliomyelitis were found to have a common source of milk, and Jubb[2] who reported the outbreak, suggested that this was a likely source of infection In Spring Valley N Y, in 1916, 7 cases occurred among the users of unpasteurized milk from a dairy A paralytic case was detected on the farm where the milk was produced and Dingman,[3] who reported the outbreak suggested flies as a means of contaminating the milk Knapp Godfrey and Aycock[4] described another small outbreak in Cortland, N Y The milker, a boy of 16, performed his duties while ill until his hands became paralyzed and he could no longer milk At a reasonable incubation period thereafter cases occurred on the milk route where the mixed raw milk from this farm and others was distributed In Broadstairs England in 1926 Aycock[5] studied a larger outbreak (62 cases) involving principally rural boarding schools Raw milk from one farm was incriminated Here, as in the outbreak we report, no known source of milk contamination was found Since, in the cases in our report, encephalitic symptoms were prominent it is interesting to note that Aycock said about the epidemic in England "It may be stated here that the polioencephalitic type of the disease was much more common in this epidemic than in the experience of the writer in the United States"

## EPIDEMIOLOGY

The school where the outbreak here described occurred was located on a civilian campus A number of barracks had been erected near the school buildings and directly adjacent to the areas where a large number of domestic animals were kept Naval authorities had permitted the school to keep its stock of animals used in long term experiments on breeding There was a dairy herd supplying raw milk to the school mess and in addition there were horses pigs and several thousand chickens The latter were housed within a few hundred feet of the barracks and mess hall These chicken houses and barns were the source of prolific fly breeding Manure had accumulated in very large quantities

All water on the campus was piped from a closed tank which was supplied by a drilled well The water was subjected to regular bacteriologic tests and was always found to be satisfactory It was therefore not chlorinated

Inside flush toilets were used exclusively and these were connected to the sewerage system of the nearby town The disposal plant was located at the opposite side of the town from the school

The naval school had a total population of 730 officers and men These all ate at the same mess operated by civilians About 50 civilians were on the campus during the day They did not eat on the campus with the naval cadets but they drank from the same water supply No recognized cases of poliomyelitis occurred in the civilian group

In the town a few cases of poliomyelitis had been reported during the summer months but the rates were lower than in many other areas in the state. No connection could be traced between any of these cases and the September epidemic at the school No suggestive illness occurred among the food handlers or the milkers prior to the outbreak

Approximately ten days before the onset of poliomyelitis in the school there were 20 cases of illness among the cadets, diagnosed as "epidemic pleurodynia" characterized by fever and chest pain Two of the 20 later developed poliomyelitis No case of "epidemic pleurodynia" could be interpreted as the primary source of the poliomyelitis outbreak

The only common contributing factors in the outbreak appeared to be the residence in the school the use of soft drinks (principally milk shakes) at the school's fountain and the eating of meals at the mess hall Case rates in each of the four classes resident in the school during the month of August were approximately equal A new class arriving Sept 2 1943 was not affected though they were present at the time of onset of the illnesses among the three remaining classes The swimming pool was used almost exclusively by one class and a number of the patients had not used it for over a month Cases were rather evenly distributed among the barracks Several patients had not left the campus at any time during the three weeks preceding the onset of their illness Several others had eaten at different town restaurants or attended movies in town but these exposures were not common to many Studies were therefore centered on the barracks, the food and milk supplies and the mess hall

Flies were found present in great numbers both in and out of the buildings Many were present in the barracks, but the number was excessive in the mess hall and the milk barn In the barrack toilets flies were seen crawling over residual fecal smears in the bowls These toilet rooms all had unscreened ventilation opening outside. One toilet for the female kitchen help in the mess hall was also found to have an open unscreened window to the exterior Each time the toilet room door was opened the flies had ready access to the kitchen

Milk from the milking machines in the barn passed directly through cooling coils into a funnel with a cloth diaphragm On this cloth, at the time of our inspection numerous flies were being rinsed with a stream of milk. Open steam sterilized milk cans into which the milk from the funnel was run contained many living flies and drowned flies were in the condensed steam at the bottom Reports on bacteriologic tests made on this raw milk by the local health department were on March 5 1943, too numerous to count, June 2 3,900 per cubic centimeter July 7, too numerous to count, July 31, 6,700 per cubic centimeter, and September 8, 25,800 per cubic centimeter In the mess hall the milk was poured into a large tank and at meal time was run into pitchers These pitchers were scalded after washing then wiped inside by hand with dish towels Flies crawled about in empty washed pitchers until meal time All patients drank milk regularly with meals They stated that dead flies were regularly found in their glasses and in the pitchers Milk remaining in pitchers after meals was returned to the cans and the tank drained into the cans and the

4 Knapp A. C Godfrey E. S., and Aycock, W L. An Outbreak of Poliomyelitis Apparently Milk Borne J A M A. 87: 635-639 (Aug. 28) 1926

5 Aycock, W L. A Milk Borne Epidemic of Poliomyelitis Am. J Hyg 7 791-803 (Nov) 1927

cans placed in a large refrigerator until the next meal This raw milk was supplemented to some extent by grade A pasteurized milk from a town dairy Milk from the town dairy was served at the soft drink fountain operated for the students on the campus All patients had had milk drinks at the fountain on recent occasions

Of a specimen of 341 flies caught there were 269 Musca domestica 67 Fannia canicularis, 2 Stomoxys calcitrans and 3 Muscina stabulans No virus was isolated from these flies by Rhesus monkey inoculation It was noted that there were numerous chicken mites (Dermanyssus gallinae) in the chicken houses and on Musca domestica from the chicken houses This is of some interest in the light of claims made by Perioni,[6] reviewed recently in THE JOURNAL,[7] that the chicken louse (Dermanyssus avium) is a vector of poliomyelitis We have not had the opportunity of seeing the original reports to verify the name of this parasite but a search through entomologic literature has failed to find any record of such a genus Other large collections of flies[8] have not been tested, since Cynomolgus monkeys are not yet available A few mosquitoes[8] were breeding on the campus, and they were collected in small numbers in the barracks, barns and chicken coops They were identified as Culex pipiens, Culex tarsalis, Culiseta incidens and Anopheles pseudopunctipennis

As a result of an official epidemiologic investigation made by the West Coast Mobile Unit, U S Navy Hospital, San Diego, Calif, in charge of Comdr R W Babione (MC), U S N, beginning September 11, recommendations were made and carried out with respect to sanitary conditions

Since the possibility of milk borne epidemics of poliomyelitis has been suggested by other investigators, and since the present outbreak contained somewhat similar characteristics of rapid onset (within eight days) and milk contaminated with flies as a probable common source of infection, it was highly suggestive that we were dealing with a milk borne epidemic Since flies have been found repeatedly contaminated with poliomyelitis virus[9] this source of contamination seems quite possible The flies had at least occasional access to human fecal material and constantly to that of many domestic animals—the material in which many of them bred Careful inquiry was made regarding outbreaks of gastrointestinal disturbances or other infections frequently occurring from food or milk contaminations without uncovering any

The case of the girl friend of one of the graduates, who had only attended the school commencement, should have furnished the clue to the exact source of the infection It did not do so She was questioned repeatedly and the clinical diagnosis verified Arriving in town with other members of her family on the evening of August 28, she visited the campus on only one occasion and did not go to the mess hall or soft drink fountain but did attend the commencement dance in the evening She and her friend partook repeatedly of the refreshments—cookies and punch consisting of bottled syrups, sugar water and ice cubes, prepared in the mess hall kitchen by civilian mess hall employees The liquid refreshments were carried to the gymnasium in a milk can, said to have been carefully washed and scalded to remove all milk odors The cookies were purchased from a town bakery Several of the cadet patients did not attend the dance or partake of these refreshments then or later The girl stayed in town two days, eating at several different places frequently accompanied by her cadet friend She then returned to school at Berkeley, Calif On Sept 6, 1943 she became ill with poliomyelitis and on the same day her cadet friend became ill at the flying field in Nevada Both developed shoulder girdle paralysis It seems probable that they had a common source of infection and their dates of onset coincided with those of the other cadets Her incubation period would necessarily be six to eight days (probably eight) if infection took place at the dance Yet her only contact with the mess hall was through punch prepared there and brought in a milk can Other cases of poliomyelitis were occurring in San Francisco, Berkeley and other Bay area cities and she had many contacts while traveling, but we hesitate to consider her case coincidental

*Known Dates of Onset of Cadet Cases and One Civilian Who Visited the Cadet School*

| Date | Number of Cases |
|---|---|
| September 1 | 1 |
| September 2 | 2 |
| September 4 | 3 |
| September 5 | 5 |
| September 6 | 5 |
| September 8 | 1 |
| Unknown | 1 |
| Total | 18 |

The dates of onset of the recognized cases among cadets including 2 of the 3 from the flying fields and 1 civilian, are presented in the accompanying table

## CLINICAL OBSERVATIONS

The total number of diagnosed cases in the epidemic, as far as we have been able to determine, was 18 On 2 the notes are too incomplete to be of use for detailed evaluation, although the presence of poliomyelitis in each is unquestioned The remaining 16 patients were fully observed, and their records present some features not commonly associated with the diagnosis of poliomyelitis The first few cases in the outbreak, indeed, were given a provisional diagnosis of encephalitis, a justifiable assumption based on the presence of mental symptoms and with due weight being given to the location of the outbreak in a region where encephalitis is not uncommon Poliomyelitis virus however, was found in the stools of 3 patients, and all except 1 gave negative neutralization tests for the western equine and St Louis types of encephalitis In view of these facts, plus the unmistakable paralysis of the poliomyelitis type that developed in 9 of the cases, there can be no reasonable doubt that the whole group were examples of poliomyelitis in an unusual form, many with cerebral manifestations

*Symptomatology*.—The usual symptoms of infection with a moderate rise in temperature, chills, headache and stiff neck were present in nearly all the cases Headache, in some instances severe was the most common complaint, being recorded in 13 cases Stiff neck

6 Perioni C El origin de la paralisis infantil (enfermedad de Heine-Medin) Semana med 2 1149 (Nov 13) 1941 Nuevos aportes anatomicos y clinicos al origen de la enfermedad de Heine-Medin ibid 1 1321 (June 29) 1944

8 Collection of these and dairy barn inspections were made by Dr W C. Reeves and Mr Pedro Galindo of the Hooper Foundation Neurotropic Virus Unit

9 Paul J R Trask J D Bishop M B Melnick J L and Casey A E The Detection of Poliomyelitis Virus in Flies Science 94 395 396 (Oct. 24) 1941 Sabin A B and Ward Robert Flies as Carriers of Poliomyelitis Virus in Urban Epidemics, ibid. 94 590-591 (Dec 19) 1941

was present in 11 The highest temperature was 104 F, the average being about 101 F The Kernig sign was noted in only 2 patients Vertigo was present in 5 patients Nine patients complained of nausea, 6 of vomiting

Sleeplessness, restlessness and confusion was an early symptom in about one third of the cases Some patients were moderately excited, and tremors were not uncommon The presence of these encephalitis symptoms is shown in the following cases

CASE 1—*History*—E E A, a man aged 20 admitted to the army station hospital Sept. 9, 1943, developed "shooting pains" in his lower back and legs on the evening of September 6 He slept poorly but attended part of his classes on September 7 That night he was restless got up and wandered about partly confused Both legs were unstable

On admission most of the pain had disappeared but he felt generally weak and "light headed" His temperature was 100 F, the pharynx was slightly injected the neck moderately stiff and the Kernig sign positive

*Examination*—In the spinal fluid September 9 there were 130 white blood corpuscles per cubic millimeter with 48 per cent polymorphonuclears Globulin was not increased Sugar was 61 mg per hundred cubic centimeters Chlorides were 700 mg per hundred cubic centimeters The gold curve was 0011000000 In the blood there were 13,400 white blood corpuscles per cubic millimeter, with 63 per cent polymorphonuclears

*Course*—By September 13 the patient was afebrile and by September 18 he was asymptomatic except for slight weakness in his legs On October 5 he showed slight nystagmus, with weakness in the thigh muscles The spinal fluid on October 7 was normal, without cells A muscle examination on October 9 disclosed no paralysis

The blood gave a negative neutralization test September 16 for the St Louis and western equine types of encephalitis

CASE 9—*History*—L. F S a man aged 20, admitted to the army station hospital Sept 9, 1943, developed a mild frontal headache, cough, malaise and sore throat two weeks before entry About September 2 the headache became generalized and severe, he felt feverish and drowsy Vision became blurred and his neck stiff On September 7 he became nervous, was excitable and had an uncontrollable tremor of his hands when holding eating utensils He wandered about, restless and with insomnia Examination showed general weakness, apathy and slight stiff neck.

*Examination*—In the spinal fluid, September 9 there were 32 white blood corpuscles per cubic millimeter, with 44 per cent polymorphonuclears Globulin was not increased Sugar was 56 mg per hundred cubic centimeters Chlorides were 710 mg per cubic centimeter The gold curve was 0011000000

In the blood there were 11,750 white blood corpuscles per cubic millimeter, with 63 per cent polymorphonuclears

*Course*—By September 13 the patient was afebrile and nearly asymptomatic. Some tenderness and weakness developed in the left shoulder on September 21 On October 5 he showed left shoulder weakness, gross tremors of the hands and fibrillation of the tongue. On October 9 the whole left shoulder showed muscle weakness, grade 'fair" It was considered that this might, at least in part, be due to a previous injury, three years before his present illness A second spinal fluid examination was negative, with 3 cells per cubic millimeter

The blood gave a negative neutralization test for St. Louis and western equine encephalitis on September 16 It was found negative again for the western equine virus on September 27 and October 11 in the one laboratory In another laboratory it was reported negative on September 11 and 25 and positive on December 3

Two patients developed nystagmus and 3 had transient diplopia The deep reflexes were exaggerated in 2, along with absent abdominal reflexes Two patients developed bulbar symptoms, with dysphagia and nasal regurgitation Only 1 had retention of urine

Paralysis of various muscle groups was transient in 1 case moderately severe in 8, severe in 1 and not present in 8 others The most extensive involvement was shown in the following case

CASE 2—*History*—B B, a man aged 20 admitted to the army station hospital Sept 3 1943, developed chills and headache on September 1 At sick bay that day, although his headache was severe, his temperature was normal On the day of admission the temperature rose to 102 6 F and his neck became stiff and painful

On admission his neck was rigid and painful, with enlarged posterior cervical lymph nodes, his throat was injected and he showed bilateral, horizontal nystagmus No paralysis was noted, but his back was hypersensitive and the muscles were in spasm

*Examination*—In the spinal fluid September 3, there were 372 white blood corpuscles per cubic millimeter with 63 per cent polymorphonuclears Globulin was increased Sugar was 111 mg per hundred cubic centimeters

In the blood there were 12 500 white blood corpuscles per cubic millimeter

*Course*—A second examination of the spinal fluid, September 4 revealed 90 white blood corpuscles per cubic millimeter with 61 per cent polymorphonuclears On September 4 the patient became incontinent, irrational and unresponsive to stimulus No paralysis was evident, but his temperature rose to 104 F On September 5 the patient developed dysphagia A third examination of the spinal fluid revealed 104 white blood corpuscles per cubic millimeter, with 61 per cent polymorphonuclears On September 6 he remained irrational No paralysis was noted except his dysphagia The abdominal reflexes were absent *He was given sulfadiazine intravenously* Extensive muscle spasm and paralysis developed in a few days which gradually improved on October 9 a muscle examination showed spasm of the cervical muscles the adductors pectorals and external rotators of both shoulders and also both hamstrings There was paralysis of both sternomastoid muscles and slight weakness of the left facial muscles, both shoulder girdles the upper arms, the hip muscles and the upper legs A spinal fluid examination in October was normal, without cells

The paralysis showed a predilection for the muscles supplied by the cranial nerves and the cervical level of the spinal cord Diplopia was present in at least 3 cases, and the facial muscles were involved in 2 the pharyngeal muscles in 2 others and the sternomastoid in 1 Six patients had some paralysis of the shoulders, of whom 4 showed paralysis also of one arm Only 1 patient developed weakness in the legs This was of moderate severity The tendency therefore was for the virus to exert its fullest effect on the motor nerve cells in the pons medulla and cervical spinal cord The following case exemplifies this tendency

CASE 7—*History*—V K., a man aged 23 admitted to the army station hospital Sept. 8, 1943, had an attack of epidemic pleurodynia on August 31 with a temperature of 101 4 F slight headache and pain over his right anterior chest at the lower border of the lung He recovered on the second day On September 4 he again became sick with sudden diplopia and vomiting On September 5 he developed neck rigidity headache and sore throat, with a temperature of 103 F His temperature remained at the same level on September 6 and on September 7 he had dysphagia and a nasal regurgitation of fluids On September 8 the temperature was 99 2 F., his dysphagia more pronounced

On admission he showed both dysphagia and dysarthria, bilateral horizontal nystagmus and an injected pharynx but no other paralysis The optic disks were normal There was no paralysis of the vocal cords

*Examination*—In the spinal fluid, September 8, were 45 white blood corpuscles per cubic millimeter, with 77 per cent polymorphonuclears. Globulin was not increased. Sugar was 66.6 mg. per hundred cubic centimeters. The gold curve was normal.

In the blood September 9 there were 9,700 white blood corpuscles per cubic millimeter, with 64 per cent polymorphonuclears.

*Course*—On September 9 the patient began to take small amounts of fluid by mouth. By September 13 he was afebrile, with mild dysphagia and general weakness but no neck rigidity. Slight weakness of the left shoulder muscles was noted on September 14, this was no longer observed on September 21, the dysphagia persisted. On October 5 slight weakness of the right shoulder was still present. Both facial muscles were affected slightly. There were tremors of the tongue and hands, but no nystagmus. A muscle examination on October 9 demonstrated weakness in the right deltoid, grade "good", deglutition was 'fair.' The right scalenus muscle was graded as fair." A second spinal fluid was negative, with 4 cells per cubic millimeter.

The blood gave a negative neutralization test for St. Louis and western equine types of encephalitis on September 16. A second blood examination on September 27 was also negative for St. Louis encephalitis.

Muscle pain was an infrequent symptom. Six patients complained of back pain, 2 of leg pain. Muscle spasm was observed in 3 and muscle twitchings in 1.

*Spinal Fluid*—In 13 cases examined from one to seven days after the initial symptoms of the disease the cell count on the spinal fluid varied from a low of 30 to a high of 372 white blood corpuscles per cubic millimeter. The average was 111 cells per cubic millimeter. Of the total cells the polymorphonuclears ranged from 18 to 77 per cent, the average being 48 per cent. The sugar and chloride content was within normal limits, with sugar averaging about 60 mg. per hundred cubic centimeters and chlorides 700 mg. per hundred cubic centimeters. One sugar gave a reading of 111 mg. per hundred cubic centimeters. The gold chloride curves showed slight changes in the midzone. The Wassermann reactions were negative. Globulin was reported increased in 3 cases and not increased in 10. Unfortunately, the amount of total protein was not recorded, thus omitting the most valuable test except for the cell count and differential, that can be done on the spinal fluid in cases of poliomyelitis. Sugar, chloride and gold curve determinations in the spinal fluid have long been known to be of minimal value in poliomyelitis, but an increase of white blood corpuscles, as shown in the cases here described, with a total protein of 45 mg. or more per hundred cubic centimeters is not only characteristic but almost essential in making the diagnosis. Rarely are cells absent and in adults, within the first weeks of the disease, the finding of 50 to 100 cells per cubic millimeter is the rule. In only 1 of our cases were cells absent, this patient with a facial paralysis, although included in the series, might be considered as an example of Bell's palsy. His complaints of headache, nausea and tremor, plus the absent abdominal reflexes on examination justifies a presumptive diagnosis of poliomyelitis.

CASE 14—*History*—P. P. K., a man aged 20, admitted to the army station hospital Sept. 9, 1943, had a headache on September 6, followed by nausea. There was no stiff neck or vertigo but some tremor of the tongue and hands.

*Examination*—On admission his physical examination was nomal except for absent abdominal reflexes. In the spinal fluid September 9, there were no cells.

*Course*—Weakness developed on the right side of his face on September 12. By September 18 this weakness had decreased and on October 11 it was minimal. No other muscles were involved. Tremor of the tongue and hands was still present on October 5.

*Blood*—In 13 cases the number of white blood corpuscles was determined one to seven days after the onset of symptoms. In 12 the counts ranged from 9,500 to 13,400 white blood corpuscles per cubic millimeter. Only in 1 case was the count normal. Of the total cells, 54 to 78 per cent were polymorphonuclears. Thus a moderate rise of white blood corpuscles in the early stage of the infection was found, with a slight increase in the percentage of polymorphonuclear cells. These observations were considered as consistent with the diagnosis.

## SUMMARY

1. Epidemiologic and clinical aspects of an explosive outbreak of poliomyelitis at a West Coast naval training school were studied. Eighteen cases were diagnosed and there were possibly at least 100 milder infections, all with onset within an eight day period.

2. Data accumulated during an epidemiologic investigation pointed to food, probably milk contaminated by flies, as the common source of infection. Milk used was mostly raw, frequently had high bacterial counts and regularly contained flies. These had access to human and domestic animal feces.

3. The patients showed, in addition to the usual signs of the disease, a high proportion of cerebral manifestations, such as sleeplessness, confusion, excitability, tremors, cranial nerve palsies, headaches, nausea and vomiting.

4. Poliomyelitis virus was isolated from the feces of 3 of 4 patients tested, and after prolonged clinical studies including systematic muscle grading, in each instance the diagnosis of poliomyelitis was made. Infection with the most likely of the arthropod borne virus infections was ruled out by serum neutralization tests.

5. In one half of the cases paralysis, either moderate or severe, developed. The paralysis was largely confined to the muscles supplied by the cranial and cervical nerves. Only 2 patients developed true bulbar symptoms, and none died.

6. The spinal fluid and blood examinations showed the usual changes associated with poliomyelitis.

---

**The Reward of an Investigator**—The discoverer in science may justifiably entertain the deeply gratifying thought that work well done, observations carefully made and recorded will ultimately combine with other observations, perhaps made long afterward, in forming the body of truth. The conquest of yellow fever, for example, involved the identification of mosquitoes, and that in turn depended on previous descriptions by entomologists who had studied scales and veins on the wings and hairs on the bodies of the insects in order to classify them. Little did they realize how their descriptions would fit into the strategy of abolishing a devastating disease. An investigator may never see the synthesis which brings his work into its relations with the work of others, but from historical evidence he can be assured that such may be the destiny of his observations. If, perchance, the labors in which he engages result in immediately practical consequences beneficial to all mankind, he has the happiness of knowing that there will be a continuing beneficence long after his own labors have ceased. There is great reward in the thought of these "durable results of the perishable years."—Cannon, Walter B. The Way of an Investigator, New York, W. W. Norton & Co., Inc., 1945.

# "MARCH FRACTURE" OF THE FIBULA IN ATHLETES

HARRY R. McPHEE, M.D.
and
C. MONTANYE FRANKLIN, M.D.
Princeton, N. J.

"March foot" or "march fracture" is a term applied to a painful condition of the foot first noted in army men following prolonged marches. It was thought to be caused originally by an inflammation of the tendon sheaths, but since the turn of the century opinion has favored the existence of a fracture. Some reports hold that a fracture visible or invisible by x-rays is present from the start. Others speak of a periostitis first, followed by a fracture line developing later. For the most part this condition has been noted in the second, third

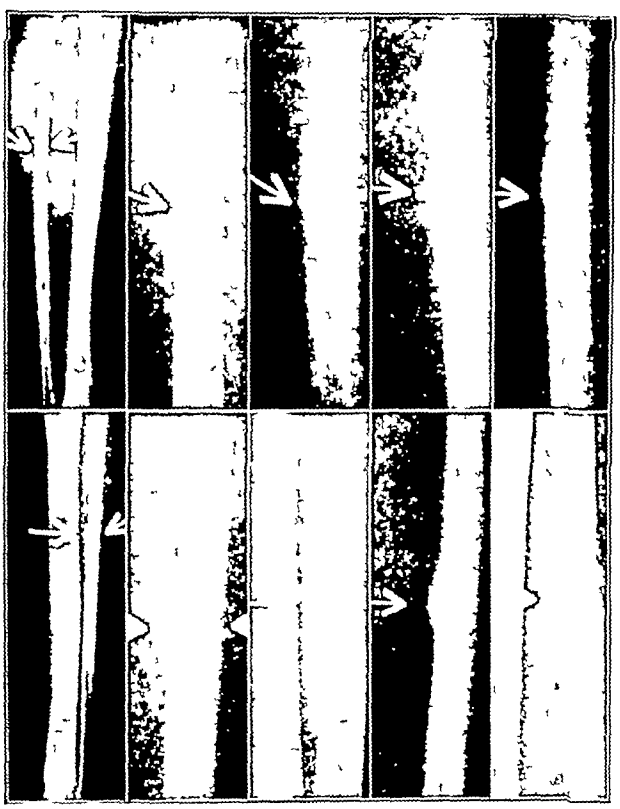

Fig. 1.—Detail views on successive dates (Feb. 17 and March 8, 8 and 27, 1939). Small scale view at left on March 8. Upper, lateral; lower, anteroposterior. Shows stages of march fracture in first runner. Line not definite until March 8. Disability thirteen weeks.

and fourth metatarsal bones, but the more recent literature has been reporting a few cases of a similar condition occurring in other bones, especially the fibula. Our purpose in this paper is to add 6 such cases and 1 of the foot, appearing in athletes at Princeton University.

The University Health Service has maintained medical and surgical supervision over its athletic teams for many years, but it was not until 1939 that this condition came to light, and at first its significance was not fully appreciated. All cases save 1 have developed in runners during the fall and winter seasons. Many more students participate in spring track work, and yet no cases have been seen at that time. The sport during the winter season is carried on in the open air on an especially constructed ten lap board track. The athlete is subject to the variations in weather conditions and temperature common to the area, but he does wear heavier suits for protection. It is interesting to note that the only case to appear in another sport happened at the beginning of the basketball season, the same year the university gymnasium burned. This fire required that the unheated hockey rink be converted into a gymnasium and basketball, which requires much running on boards, started before a heating system was installed. Hence it would appear that running, coolness and boards had something to do with the condition. This cannot be true because the circumstances under which the men have trained and competed in track work have remained essentially unchanged for at least two decades, and it is reasonably certain that cases were not overlooked prior to 1939. Why they appeared then and have continued to appear sporadically since is not known.

The condition was initiated usually by a complaint of stiffness and dull aching in the leg at the beginning of exercise, which subsided after the athlete warmed up. As the process advanced the symptoms became more pronounced, did not disappear during workouts and finally became too painful to permit exercise to be carried on. Most victims could walk with considerable comfort as long as they did not try to run. Early x-rays showed nothing or at most a suggestive haziness of the periosteum. Later definite fuzziness, similar to that seen in periostitis, developed at a point along the bone and more frequently than not was accompanied with a doughy infiltration and swelling in the overlying soft tissues. Two of the cases were seen by orthopedic specialists during this stage and biopsies were requested on the ground that a tumor or tuberculosis was present. A definite fracture line with lateral radiations appeared in about four weeks. The process became sharply defined and subsided to a spindle-shaped swelling along the bone. The completed cycle of disability as far as running was concerned took ten to fourteen weeks, and attempts to modify the course by early immobilization were unsuccessful, as will be evident from the case reports which follow.

About the middle of January 1939 a middle distance runner noticed a dull ache in his left leg as he started to run. The ache would subside as he warmed up and reappear for a short time after practice. He regarded it as a mild "shin-splint"—track vernacular for a strain of the muscles along the anterior margin of the tibia—and, because it did not annoy him when walking, he did nothing about it. Fate took a hand on January 29 and forced him to bed with influenza. There were no local symptoms at the time, but, on the basis of the history, physical therapy was applied during his convalescence. In spite of the ten days of rest and care the ache was more severe and developed into real pain when he resumed running on February 9. Rest and diathermy were instituted for four or five days but to no avail. There had been no history of trauma in any way. An x-ray was taken February 17, one month after the start of symptoms, and revealed a well established localized periostitis at the junction of the upper and middle thirds of the fibula.

Running was forbidden and physical therapy continued. The patient visited an orthopedist of his father's acquaintance about March 7. A tentative diagnosis of bone tumor or tuberculosis of the bone was made. However, a second x-ray March 8 showed an advanced periostitis with a ramifying absorption line clearly visible in the anteroposterior view and less clearly on the semilateral but none the less present. The interim

history disclosed that he had lightly brushed an upholstered movie seat the week before This was considered the cause of the fracture in spite of his protests that the contact had been too light to cause any damage A cast was applied until the clinical picture and x-ray warranted its removal some three weeks later For personal reasons he did not compete in track events that spring but turned in some brilliant performances in the next three years without any difficulty It is interesting to note that he was listed as having a "fracture of the fibula left" as of March 8 and that his period of disability covered thirteen weeks

A second boy came to our attention October 29 of the same year with a painful right foot which had been bothering him for a month during his cross-country running It started with a dull ache while running, which would subside when he was quiet It did not respond to strapping and support or to the trainer's therapy Rather it became more and more painful and when first seen he had localized swelling heat and tenderness over the shaft of the fourth metatarsal bone The x-ray revealed a well established periostitis but no definite fracture line was seen A diagnosis of "march fracture" of the foot was made and a subsequent x-ray taken ten days later showed the absorption line He was put in a cast and on crutches for about three weeks and was finally discharged on January 3, thirteen weeks after the onset of his trouble

The next case appeared in a middle distance runner during the winter track season Early in February 1940 he complained of soreness in his foot Investigation failed to reveal any positive finding He pursued a course of hydrotherapy, but the soreness continued and spread to the leg The early symptoms were those of a dull ache increasing in intensity He consulted an osteopath, who said he had pulled his flexor hallucis longus muscle and gave him some treatments These seemed to help for short periods but did not disperse the trouble Acute pain in the left leg forced him to stop during a race on February 22 Since it was the end of the season he rested in comparative comfort until late March The trouble returned as soon as he tried to run and was now definitely located in his leg He consulted the health service on April 8 A tender area of doughy infiltration 4 to 5 cm in diameter could be palpated on the outer and posterior aspect of the left leg a short distance below the middle of the fibula. An x-ray showed an advanced localized periostitis of the fibula with an absorption line similar in character to cases 1 and 2 in the late stage The use of a cast and subsequent physical therapy brought his disability to an end fourteen weeks after the first symptoms

The similarity between these 3 cases was so striking that they were now considered to be similar entities The trainers were asked to send in any track men who complained of aching in the leg Several were sent but they turned out to have ordinary strains of the anterior extensor muscles along the border of the tibia However, on Oct 28, 1940 a renowned track man was admitted to the university hospital complaining of a dull ache in his right leg which started five days before, during cross-country practice It had been no more than slightly annoying for the first two days, but on the third day he had run a competitive race during which the leg gave him considerable pain At the time of entrance to the hospital, much tenderness was elicited along the lower third of the right fibula, and there was an indurated area 3 to 4 cm in diameter, red and warm, about 2 inches above the ankle joint An x-ray was made on the 28th and again on the 31st from slightly different angles but no bony pathologic change was noted The tenderness, redness and local heat subsided with rest and elevation by November 1 He was discharged, but running was interdicted Heat and rest other than walking to and from classes were instituted He was comfortable and strained at the leash to go back to running He was destined to forego this pleasure over a period of thirteen weeks, for an x-ray on November 13 showed a small patch of periosteal proliferation just above the ankle joint A cast and crutches were applied immediately, but the absorption line appeared on the 29th The cast was worn for about five weeks, during which time the lesion went through its typical stages roentgenographically This period was followed by three weeks of physical therapy and exercise before he could resume his track work without difficulty

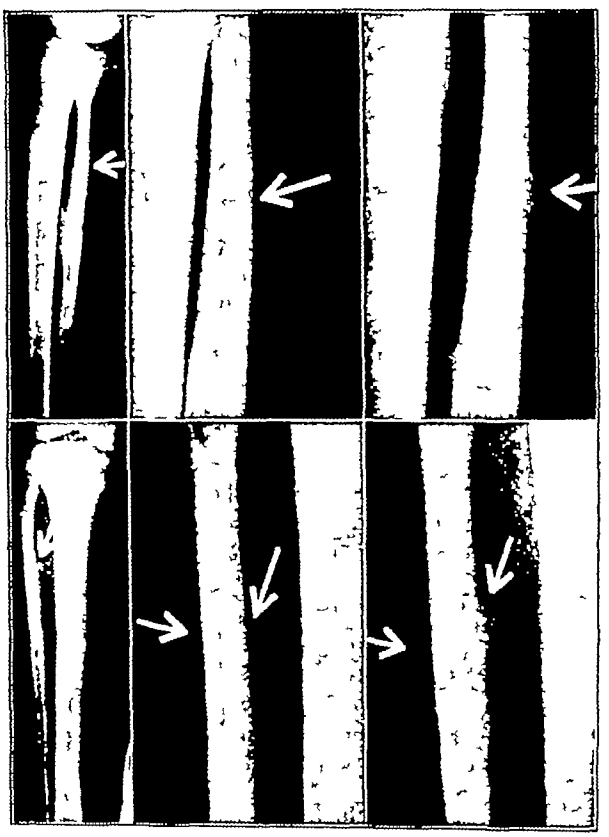

Fig 2—Detail views on March 20 and April 13 1936 Small scale view at left on April 13 Upper lateral lower anteroposterior Shows demonstrable fracture in lacrosse player Complete recovery in three and one half weeks

No further cases were seen until near the end of the winter track season of 1941-1942, when 2 appeared at about the same time Unfortunately their histories were destroyed in a fire, and all attempts to reconstruct them authoritatively have failed One was in the right leg and the other in the left They did parallel the other cases in their mode of onset and clinical course One was treated with cast and crutches and the other patient was let walk There was no appreciable difference in their period of disability, which covered approximately ten to twelve weeks

The first and only case to develop in a sport other than track appeared in basketball during the winter of 1944 The youngster started practice in the unheated gymnasium about November 1 but it was not until the third week in November that he noticed a slight

stiffness in his right leg when he started to play. This stiffness disappeared as he warmed up, but a mild ache remained for fifteen to twenty minutes after practice. Each day he noticed that it became more and more uncomfortable even after he was warmed up, so he reported to the trainer who treated him with moist heat massage and soothing dressings. The condition continued to get worse and finally he could not bear to let his heel go down while running. He was referred to the infirmary on December 15, which was roughly one month after his first symptoms. The right leg presented a localized slightly warm tender swelling 4 to 5 cm. in diameter at the junction of the middle and lower thirds of the fibula. The x-ray showed no more than suggestive signs of a periostitis. Military complications prevented the application of a cast and also interrupted further contact until January 8. The inspection findings then were the same, but the x-ray revealed very definite periostitis, and a cast was applied in spite of his violent protests. He carried the case to an orthopedist, who had operated on his other leg for Osgood-Schlatter's disease. A bone tumor was diagnosed and a biopsy was advised. However all concerned agreed to delay two weeks, during which time a fracture line was promised. It appeared in very typical form in the x-ray taken January 22. The cycle was completed without further incident on February 19 after a period of thirteen weeks.

The outstanding thing about these cases to any one dealing with athletic injuries is the prolonged loss of time. The fibula is not a weight-bearing bone and disability to an athlete resulting from injuries to its shaft rarely exceed six to eight weeks. It was a trifle upsetting therefore to have an orthopedic friend to whom the first 4 cases were demonstrated remark "there is a fracture there in the beginning only you do not see it." That of course was the idea advanced by Stechow[1] in 1897 and supported by Schulte[2] (1897) by Kirchner[3] (1905) and by Krause and Thompson[4] (1944). They pointed out the infallibility of the x-ray. That contention must be admitted but it is certainly reasonable to expect small fractures in similar locations to behave somewhat alike under similar circumstances. Hence it is interesting to make notes on a case occurring in lacrosse.

Lacrosse is an activity which involves considerable running, stopping, fast starting and turns which put heavy strains on the legs. On March 20, 1936 a player was struck on the right leg with a lacrosse stick. He had sharply localized tenderness about 4 inches below the head of the fibula, but no crepitus. He could not bear to run. The x-ray on the same day revealed a fine hairline fracture near the lower end of the upper third of the right fibula and an old ossified hematoma lower down. He was given physical therapy treatments for three days until a duraluminum protective splint could be made which extended from the head of the fibula to the outer malleolus. With this in place to ward off blows, he resumed his work in lacrosse. An extra large callus resulted and, in sharp contrast to case 1, in which the lesion was at approximately the same level, his distress got less and less each day and he had totally recovered in twenty-four days. Other cases of known greenstick and hairline fractures of the fibula from external trauma in athletics could be cited to illustrate the shorter period of disability and the reversal of clinical symptoms and in no instance did such fracture parallel the pattern of the cases under discussion. Hence a feeling persists that some other factor besides simple fracture is involved in these conditions.

4 Krause, G. R., and Thompson, J. R., Jr.: March Fracture. Am. J. Roentgenol. 52: 281-290, 1944.

SUMMARY

Six cases of so-called "march fracture" of the fibula and 1 of the foot occurring in athletics were encountered. The existence of a hidden "fracture from the beginning" has been questioned in light of comparison with the clinical picture in cases of known fracture.

## PROSTATIC CANCER TREATED BY ORCHIECTOMY: THE FIVE YEAR RESULTS

CHARLES HUGGINS, M.D.
Chicago

Five years is a customary period to appraise the results of treatments of cancer and this time has elapsed since the introduction of the endocrine therapy of prostatic carcinoma. The antiandrogenic treatment consisting of orchiectomy or the administration of estrogen has proved to have both theoretical and practical significance. There has emerged from this study the fact that cancer of the prostate is usually not autonomous since the neoplasm grows or shrinks when androgens are administered or eliminated. The antiandrogenic measures have a general modality of action and, in a sense, are chemotherapeutic agents although not specific ones, estrogens are the first agents of known chemical constitution (aside from radioactive chemicals) which ameliorate carcinomatosis in man, and they are the only medicines known which, when taken by mouth influence cancer beneficially.[1] The long time practical benefit will be demonstrated in this paper.

### NATURAL COURSE OF PROSTATIC CANCER

Only in the classic study of Bumpus[2] has an extensive series of untreated cases been followed. In 485 patients with no form of treatment the average duration of the disease from the first symptoms to death was about thirty-one months, 4 patients lived more than three years and 2 of them more than ten years. When metastasis had occurred at the time of examination, two thirds of the patients were dead within nine months.

For comparison the results of various nonendocrine therapeutic measures may be cited. Caulk and Boonitt[3] reported that 10 per cent of patients treated with the cautery-punch operation and irradiation were living after five years. Muir[4] found the average duration of life of 18 patients treated with cystostomy and irradiation was three and one-half years. Illyes[5] stated that 5 of 48 patients (10.5 per cent) treated with partial prostatectomy lived five years. Barringer[6] found that 20 of 351 patients (5.7 per cent) were controlled over

From the Department of Surgery, the University of Chicago.

five years after external irradiation and implantation of radium needles Hager and Hoffman [7] noted that 4 of 307 treated patients (1 3 per cent) survived five or more years Thompson [8] reported that 46 of 337 patients (14 1 per cent) subjected to transurethral resection of the prostate survived five years or longer Prince and Vest [9] treated 57 patients in thirteen different ways, and 4 patients (7 per cent) survived five years or more Palomo [10] stated that 5 of 165 patients (3 per cent) lived five or more years

## HISTORICAL

Wugmeister [11] treated men who had prostatic hypertrophy with estrogen on the theory that this disease was due to hypervirilization as a result of a failing of the supply of female sex hormone in the organism Kahle and Maltry [12] similarly treated a series of patients with prostatic hyperplasia and observed a decrease in the size of the gland and of the symptoms in some cases More experience and with refined methods [13] has shown that reduction in size of the prostate does not occur regularly or to a great extent, and the general use of estrogen at the present time is not warranted in prostatic hypertrophy

It was found however in dogs [14] that spontaneous cystic hyperplasia of the prostate underwent prompt and massive involution following orchiectomy or estrogen administration Accordingly a series of patients with far advanced prostatic cancer was treated [15] with these measures and it was discovered that androgens activate the disease while antiandrogenic procedures often induce a remission Estrogen had not previously been used in prostatic cancer Orchiectomy had been extensively practiced in the treatment of noncancerous prostatism but only Young [16] had described its employment in the treatment of prostatic carcinoma. Young's experience was limited to 2 cases and the results were negative

Some months after the demonstration of the influence of androgens on cancer of the prostate, Munger [17] independently reported the beneficial results of irradiation of the prostate and testes in this disease While it is possible to eliminate any tissue (and it is at present feared the universe) by electronic methods it was pointed out that the Leydig cells of the testis were unusually highly resistant to external irradiation in both animals [18] and man [19] and the conclusion was reached that irradiation of the testis is not feasible in the practical endocrine management of prostatic cancer

There have since been numerous publications which in general have confirmed the beneficial results seen in some cases following endocrine treatment Randall [20] has reported the results in 5 patients treated with orchiectomy, 1 of these patients was alive and in good general condition but with evidence of metastasis over six years after testicular excision

TABLE 1—*The Course of Prostatic Cancer in Twenty-One Patients After Orchiectomy*

| Case Name | Age Yrs | Bone Metastasis | Duration of Remission | Length of Life | Comment |
|---|---|---|---|---|---|
| 1 A J | 75 | Yes | 6¼ yrs | Alive | No signs of malignancy 6¼ years after orchiectomy |
| 2 E K | 61 | No | 4¾ yrs | 4¾ yrs | Prostate remained indurated and small died of coronary thrombosis |
| 3 P G | 74 | Yes | 1¼ yrs | 2 yrs | Prostate atrophic while metastases flourished terminally |
| 4 S R | 72 | Yes | None | 5½ mos | Prostate atrophic and metastases flourished terminally |
| 5 G P | 73 | Yes | None | 8 mos | Prostate small but indurated |
| 6 M M | 56 | Yes | 5 mos | 17 mos | Prostate atrophic terminally |
| 7 J M | 75 | No | 2 yrs | 3¾ yrs | Steady progression of primary lesion after 2 years |
| 8 P R | 64 | Yes | 3½ yrs | 6¼ yrs | Spectacular regression of bony lesions followed by recrudescence |
| 9 J D | 65 | Yes | 3½ yrs | 3 yrs 11 mos | Primary became atrophic metastases flourished |
| 10 C R | 74 | Yes | None | 8 days | Died of pneumonia |
| 11 E B | 73 | No | 5½ yrs | Alive | Very slow increase of cancerous extension in seminal vesicle |
| 12 L V | 60 | No | 6 mos | 16 mos | No metastasis extensive progression of primary lesion |
| 13 C B | 61 | Yes | 11 mos | 1 yr 7 mos | Spectacular regression of bony lesions and primary followed by recurrence |
| 14 J R | 80 | Yes | 5¼ yrs | Alive | No signs of malignancy 5½ years after orchiectomy |
| 15 O A | 75 | Yes | 3½ mos | 3½ mos | Died of pneumonia |
| 16 P M | 55 | Yes | 5 mos | 11 mos | Progression of primary lesion and metastasis |
| 17 J C | 71 | Yes | 5 yrs | Alive | No signs of malignancy 5 years after orchiectomy |
| 18 F W | 63 | Yes | 5 yrs | Alive | No signs of malignancy 5 years after orchiectomy |
| 19 F D | 84 | Yes | 9 mos | 14 mos | Complicated with arteriosclerotic heart disease prostate atrophic |
| 20 G B | 74 | No | 13 mos | 16 mos | Prostate small and indurated |
| 21 G R | 61 | No | 12 mos | 16 mos | Associated cancer of rectum prostate became smaller but remained indurated |

## MATERIALS AND METHODS

The first series [21] of patients treated with orchiectomy consisted of 21 consecutive men presenting far advanced prostatic cancer as defined by the presence of demonstrable metastases or local infiltration considerably beyond the prostatic capsule One person (patient 10) died of pneumonia eight days after operation and will not be considered further in this paper, leaving an effective total of 20 patients Fourteen of

these patients had radiographic evidence of osseous metastasis Therapeutic irradiation was not employed, and estrogen was not administered until it was obvious that the disease was in relapse

The end of a remission was estimated from the beginning of persistent weight loss or the development of severe symptoms the result of carcinomatosis

Fig 1 (case 1) —Appearance of pelvis in October 1939 before orchiectomy showing extensive metastasis in the pelvis with a pathologic fracture of the right pubis

## RESULTS OF TREATMENT

*Early*—In 2 cases (10 per cent) there was no obvious benefit from orchiectomy, while in the remaining 18 cases alleviation of clinical symptoms occurred for a shorter or longer period In this group of 20 senile men (table 1) there were 2 deaths from intercurrent disease, namely from coronary thrombosis (case 2) and pneumonia (case 15), but the series is not corrected for these deaths

Eleven patients (55 per cent) died during the first two years after orchiectomy (table 2) and 4 additional patients between thirty-six and sixty-three months The duration of life among the 15 fatal cases was three and one-half to sixty-three months, and the median survival time was sixteen months The duration of the remission was three and one-half to fifty-seven months, and the median time of improvement was eleven months Among the 15 fatalities the prostate was soft, small and atrophic to clinical examination in 4 cases, while the metastases were flourishing in their growth in bone marrow and lymph gland

TABLE 2—*Survival After Orchiectomy for Prostatic Carcinoma*

| | |
|---|---|
| Less than 1 year | 4 cases |
| 1 to 2 years | 7 cases |
| 3 to 4 years | 2 cases |
| 4 to 5½ years | 2 cases |
| More than 5 years | 5 cases |

*Late*—Five patients have survived more than five years after orchiectomy, 1 man (patient 11) is in good health but has a mass of tumor tissue the size of a hen's egg in the region of the seminal vesicle No sign of disease can be detected in 4 patients (20 per cent) All these patients had widespread metastasis to bone with elevated serum phosphatases at the time of orchiectomy, in each case after five years the enzyme levels are within the normal range and the bones show equivocal or no evidence of metastasis

## REPORT OF CASES WITH SURVIVAL AFTER FIVE YEARS

CASE 1[22]—A J, aged 75, had acute retention of urine in 1939 and a diagnosis of associated hypertrophy and cancer of the prostate was made. His weight was 50 Kg The prostate was greatly enlarged (4+) and soft on the right side, but on the left there was stony induration extending along the left seminal vesicle Roentgenograms showed extensive osteolytic and osteoplastic metastases in the pelvis, with a pathologic fracture of the right pubis (fig 1) On Oct 16, 1939 orchiectomy was done and on Jan 10, 1940 the prostatic adenoma was enucleated

On Jan. 17, 1946 the patient was free from symptoms and weighed 60 Kg The prostate was soft and barely palpable. A roentgenogram of the pelvis showed healing of the fracture, with regression of the metastases, several small areas of rarefaction in the region of the sacroiliac joint were present (fig 2) The level of the phosphatases of the serum were acid 2 units, alkaline 9 units[23]

CASE 11—E B., aged 75, complained of frequency and difficulty in urination for one year preceding his admission to the hospital on Oct. 30, 1940 Pain in the right groin had been present for two months The prostate gland was moderately enlarged (2+) and nodular, and there was extension of the carcinoma along the seminal vesicles, producing massive wooden induration A roentgenogram of the pelvis and the levels of serum phosphatases were normal His weight was 56 Kg Orchiectomy was performed on Nov 2, 1940

On Feb 22, 1946 the patient was asymptomatic and weighed 66 Kg The prostate was small and soft, and there was a hen's egg sized induration in the vesicular region

CASE 14—J R, aged 80, complained of pain in the dorsal and lumbar regions of the back for five months preceding his admission to the hospital on Oct 30, 1940 For two months he had spent most of his time in bed and was unable to walk without pain His weight was 62 Kg On examination it was found that the patient could not change his position from lying to sitting without intense agony The prostate was slightly enlarged (2+) and there was a hard nodule in the apex of the gland about the membranous urethra Roentgenograms showed diffuse osteolytic lesions in the pelvis, there was partial collapse of the bodies of the sixth dorsal and second lumbar vertebrae The levels of serum phosphatase

Fig 2 (case 1) —Appearance of pelvis in October 1945 six years after orchiectomy revealing healing of the fracture and disappearance of evidence of metastasis.

22 Three of these cases have been described in greater detail earlier (Huggins Stevens and Hodges,[21] Huggins C The Treatment of Cancer of the Prostate Canad M A J 50: 301 307 [April] 1944)

23 All units of phosphatase in this paper are those of King and Armstrong per hundred cubic centimeters

were acid 37 units, alkaline 19 units Orchiectomy was performed on Nov 12, 1940 and there was complete relief of pain within five days

On Feb 18, 1946 the patient was free from symptoms and his weight was 76 Kg The prostate gland had atrophied and there was no induration. There was no evidence of metastasis in roentgenograms and the serum phosphatases were acid 2 units, alkaline 9 75 units

Fig 3 (case 17) —Appearance of pelvis in February 1941 showing extensive osteoplastic metastasis.

CASE 17—J C., aged 71, about six months before admission developed pain in the lower part of the abdomen and back so severe that much sedation, including opiates, was given. Three weeks before admission numbness developed over the buttocks and the posterior aspect of the thighs, accompanied with urinary retention, complete fecal incontinence and inability to stand or walk He weighed 46 Kg There was atrophy of all the musculature of the legs, especially the gluteal muscles, the knee and ankle tendon reflexes were absent, there was a saddle area of anesthesia in the skin enervated by the second to the fifth sacral segment inclusive, a decubitus ulcer was present the anal sphincter was relaxed, there was paradoxical incontinence of both urine and feces, and lumbar puncture yielded yellow fluid, with a high protein content, which coagulated on standing The prostate was slightly enlarged (2+), stony hard and nodular, with much induration along the seminal vesicle and the base of the bladder A roentgenogram (fig 3) revealed extensive osteoplastic metastasis in the pelvis, the lumbosacral spine and the upper part of the femurs The phosphatase levels of the serum were acid 22 units alkaline 54 units Orchiectomy was performed on March 5, 1941

On March 6, 1946 the patient had no symptoms and his weight was 71 Kg The prostate was atrophic, flat, soft and without nodularity There is no evidence of neurologic abnormality, the sensory examination, reflexes and the tonus of the anal sphincter are normal A roentgenogram of the pelvis (fig 4) shows complete clearing of the metastatic lesions, although there are two sclerotic areas of bone condensation visible The values of the serum phosphatases were acid 1 5 units, alkaline 9 5 units

CASE 18—F W, aged 61, had acute retention of urine in 1933 which was treated by transurethral resection of the prostate, a diagnosis of adenomatous hyperplasia was made on pathologic examination In 1941 he complained of frequency of urination and of pain in the rectum for six weeks The prostate was moderately enlarged (3+), with stony induration of the right lobe A roentgenogram of the pelvis revealed an osteolytic lesion in the neck of the right femur, the phosphatase activity of the serum was normal Bilateral orchiectomy was performed on March 5, 1941

On March 6, 1946 the patient was asymptomatic and the prostate was soft and atrophic. The lesion in the femur had disappeared in the roentgenograms The levels of the serum phosphatases were acid 3 units, alkaline 7 units

## COMMENT

The early evidence of clinical improvement following orchiectomy includes (among other effects) the relief of pain, improved appetite with gain in weight, decrease of anemia and a decrease of size and sometimes the disappearance of the primary tumor and of the metastases In 1 patient (case 17) there has been relief of paraplegia, similar cases have been described by Nesbit and Cummings [24] and by Clarke and Viets [25]

In the laboratory, improvements of the disease after antiandrogenic therapy may be detected through changes in the acid and alkaline phosphatase activity of serum Kearns [26] has also demonstrated a striking decrease in the sedimentation rate of the blood after estrogen administration

Five patients survive the five year period, one man has a slowly growing tumor, while in four of these cases we have been unable to detect activity of the tumor It is true that an occasional untreated patient with prostatic cancer will live more than five years although in such patients the tumor does not regress but remains in a slowly growing state, an explanation for prolonged survival in some untreated cases must be spontaneous androgenic deficiency through accidental physiologic failure of androgen production

It is still impossible to predict the course of the disease following orchiectomy at this time With respect to the 4 patients surviving five years after orchiectomy and with great involution of the neoplasm, the ages ranged from 63 to 80 years One patient (18)

Fig. 4 (case 17) —Appearance of pelvis in March 1946 five years after orchiectomy, two small areas of osteosclerosis are seen in the right ilium

had only moderately advanced carcinomatosis, while in 2 men (patients 1 and 14) the disease was far advanced and 1 patient (17) was moribund Therefore the extent

of the lesion is not of great moment Two factors are apparently of significance in determining the effectiveness of orchiectomy the tumor must be androgen dependent and the testis must contribute functionally significant amounts of the total production of androgen

Fig 5 (Patient JT) —Metastases of prostatic carcinoma in scalp before orchiectomy

Fig 6 (Patient JT) —Resolution of metastases of prostatic carcinoma thirteen months after orchiectomy

It has been established that human prostatic cancer may be or may become independent of androgens This evidence is based on removal of the adrenal glands in men who have had a relapse after an orchiectomy-induced remission, life being supported by adrenal substitutive therapy,[27] here the androgens were apparently abolished as determined by the excretion of 17-ketosteroids and urinary comb growth androgens, yet the cancer followed its unfavorable course It is known that castration does not cause the epithelial cells of the normal prostate to disappear, they merely shrink and remain functionally quiescent

The question of supplemental therapy arises in patients with unfavorable response to orchiectomy It can be easily demonstrated that the addition of estrogen to a small number of patients in relapse will cause improvement, as in the following case

J T, aged 66, had carcinoma of the prostate with associated bright pink papular metastases over the scalp (fig 5), chest, abdomen and back, orchiectomy was performed and a biopsy of one of the nodules over the sternum showed a typical prostatic adenocarcinoma which was rich in acid phosphatase when stained by the method of Gomori.[28] One year after castration many of the nodules had disappeared (fig 6) but other hyperemic papules had developed in the skin over the chest.

Diethylstilbestrol 1 mg daily was administered by mouth Within four days the lesions had become pale and within six weeks the lesions were flat and at this time estrogen was discontinued Six weeks later the lesions had reappeared in their rosy elevated form and they again became flat and pale when estrogen was given

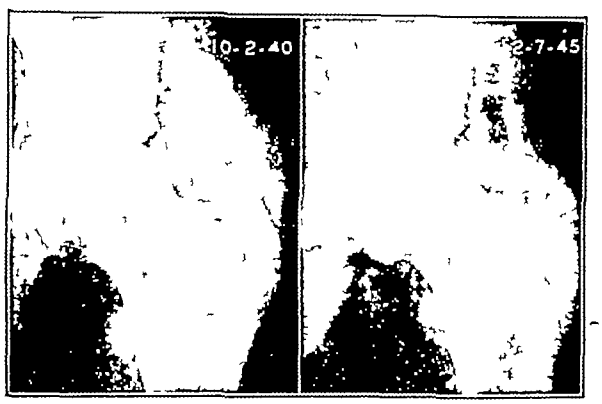

Fig 7 (case 8) —Appearance of left femur before and five and one-third years after orchiectomy Metastasis in the neck of the femur present in 1940 had disappeared and had not recurred in 1945 although new lesions are present lower in the femur

The beneficial effects of estrogen in our experience have not been prolonged nor have we encountered any other agent which would greatly benefit in postorchiectomy failure

An important consideration of the effect of relapse after orchiectomy in disseminated prostatic cancer is the disappearance of certain metastases and reappearance of lesions in other areas This phenomenon occurred twice in the present series It was observed most clearly in cutaneous metastasis and in bone (fig 7) Orchiectomy had apparently injured cancer cells so severely in certain areas that they did not again become active

It has previously been demonstrated [10] that prostatic cancer sometimes grows more rapidly in metastases in bone marrow and lymph glands than in its primary location In the present series in 4 of the 15 fatal cases the primary neoplasm became soft and remained

27 Huggins, C and Scott W W Bilateral Adrenalectomy in Prostatic Cancer Clinical Features and Urinary Excretion of 17 Ketosteroids and Estrogen Ann Surg 122:1031-1041 (Dec) 1945

28 Gomori G Microtechnical Demonstration of Phosphatase in Tissue Sections Proc Soc Exper Biol & Med 42:23-26 (Oct) 1939

clinically atrophic while the disease grew in its metastatic location to cause death

Although the effects of orchiectomy on prostatic cancer are at times very profound and prolonged, it is premature to suggest that any one of these patients has been cured

## CONCLUSION

Remissions of varying length of time occurred in 18 patients among 20 with disseminated prostatic cancer treated with orchiectomy After five years 1 patient is alive with slowly advancing prostatic carcinoma and in 4 patients there is no clinical or laboratory evidence of cancer at the present time

The antiandrogenic therapy of cancer of the prostate demonstrates that a chemical change in the internal environment of the host has brought about a long-continuing regression of a malignant neoplastic process.

# RUPTURED INTERVERTEBRAL DISK SIMULATING ANGINA PECTORIS

COLONEL ALLEN IZARD JOSEY
and
LIEUTENANT COLONEL FRANCIS MURPHEY
Medical Corps Army of the United States

Among the many conditions with which ruptured intervertebral disks in the cervical region may be confused is coronary artery disease It is our purpose in this paper to review some of our cases of ruptured cervical disks which have caused symptoms similar to those of angina pectoris and coronary thrombosis and to speculate on the cause of the precordial pain It is hardly necessary to emphasize the importance of differentiating between these diseases, not only because of the difference in the treatment and in the prognosis but because many people are made hopeless cardiac cripples by such errors in diagnosis

Intraspinal rupture of one of the lower cervical (fifth, sixth or seventh) disks[1] usually causes pain in the neck with radiation to the shoulder, to the precordium and down the arm, often associated with stiffness of the neck, weakness in the arm and hand and numbness of one or more of the digits The pain is at times acute and severe and aggravated by coughing, sneezing or moving the neck There may or may not be a history of trauma involving the head or neck The recurrent episodes of pain are usually related to physical strain involving the arm and neck but are also related to position of the head and neck and not infrequently occur when the patient is in bed Most often the radiation of pain is from the neck to the shoulder and arm, but in some cases the pain begins in the anterior part of the chest over the heart and may radiate to the shoulder, neck or arm Physical examination usually reveals a stiff neck, reduced reflexes in the affected arm and hypesthesia in one or more digits Occasionally one may find atrophy of the muscles in the upper arm and rarely atrophy of the pectoral muscles[2] The pain may be reproduced by movements of the neck, by pressure over various roots of the brachial plexus at the affected site and by pressure on the head[3] X-rays of the cervical spine show straightening of the spine in the lateral projection or a reversal of the normal lordotic curve, with acute forward angulation at the level of the affected disk in the great majority of cases Narrowing of the intervertebral space may be seen in the lateral views, and in some instances an oblique view will show a reduction in size and alteration in shape of the intervertebral foramen at the affected segment An osteophyte in this intervertebral foramen and other evidences of localized arthritis may be present

Since the term localized arthritis will be used, it is necessary to explain the relation between this condition and ruptured intervertebral disk Keyes and Compere[4] in 1932 pointed out that destruction of, or injury to, the intervertebral disk produces a localized arthritis Oppenheimer,[5] writing on the subject in 1940, was in agreement with this observation Since that time it has been shown[6] that such localized arthritis in the lower cervical and lower lumbar regions is the result of rupture of the intervertebral disk between the involved vertebral bodies and that actually the osteophyte in the intervertebral foramen is merely calcification in the annulus fibrosus (the ruptured portion of the disk) and the posterior longitudinal ligament over a previously herniated nucleus pulposus

In a number of cases of rupture of the lower cervical disks the presenting symptom is pain in the precordial region This pain may be of such severity as to overshadow any other symptom, although there is usually radiation to the shoulder and down the arm Frequently the presence of any pain in the neck or persistent numbness in the fingers is determined only after the patient is closely questioned. The pain in the chest may be related to exertion, and real dyspnea may be present It is in such cases that the diagnosis is not infrequently confused with angina pectoris or coronary occlusion This syndrome of precordial pain simulating coronary artery disease caused by ruptured cervical disk was first described by Semmes and Murphey,[1] who reported 4 such cases in 1943 Precordial pain simulating that of coronary insufficiency caused by arthritis in the lower cervical spine had been previously reported by Nachlas[7] in 1934, Hanflig[8] in 1936 and Reid[9] in 1938 The latter authors reported a total of 7 cases of "pseudo-angina" caused by what they designated as arthritis of the cervical spine It appears to us in the light of present knowledge that some of these cases in all probability represented instances of ruptured cervical intervertebral disks Therefore, since this important syndrome is not generally recognized as the result of a ruptured cervical disk and the common textbooks on heart disease fail to emphasize it in the differential diagnosis of coronary artery disease, and because we believe that it is a relatively common syndrome we are reporting a group of 7 cases selected from a larger group of approximately 30 cases seen by us within the past three years

REPORT OF CASES

CASE 1.—A man aged 52 received a torsion type of injury to his head and neck in December 1940 while riding in a half-track. About three months later he developed a pain in the right side of the neck, shoulder and arm which was progressive and was aggravated by exertion related to the right arm and shoulder. During a period of four months prior to May 1943 he had several bouts of sharp pain lasting from three to five minutes localized to the substernal area. Two of the attacks became manifest during a period of anxiety. He noticed that walking 50 yards frequently precipitated similar attacks of pain associated with a feeling of constriction in the substernal region and he became alarmed about his condition thinking that he might have heart trouble.

He was admitted to the Neurosurgical Section of O'Reilly General Hospital May 6, 1943. Examination showed limitation of motion in the neck, exquisite tenderness over the right brachial plexus and hypesthesia over the right ring and little fingers. It was recognized that he had a herniated nucleus pulposus in the lower cervical region on the right. One of us (F. M.) who examined the patient thought that he might also have angina pectoris. However, a careful cardiac survey, *including exercise tolerance and electrocardiographic tracings*, gave normal results. The blood pressure was 110/88. A pantopaque myelogram was done and revealed a defect between the sixth and seventh cervical intervertebral space on the right. A partial laminectomy under local anesthesia was done on June 12, 1943 and a large herniated nucleus pulposus was found between the sixth and seventh cervical vertebrae on the right, compressing the seventh cervical nerve root. This was removed and the pressure on the nerve root was entirely relieved. By July 1, 1943 the patient had become asymptomatic except for some slight residual numbness in the right index finger, and he returned to his usual duties. On Dec. 6 1944 he suffered a mild head and neck injury when he fainted while taking a shower bath. Following this he had some stiffness of his neck for a period of two weeks but was then asymptomatic until Aug. 1, 1945 when he experienced the onset of a constant pain in the left arm radiating downward to the fourth and fifth fingers and also about the left shoulder, with definite radiation of an intermittent nature to the precordial area. He did not have dyspnea or palpitation.

He was again admitted to O'Reilly General Hospital on Aug. 3, 1945 on a litter, with severe pain in the precordial area and left arm. Examination showed limitation of neck motion, tenderness over the left brachial plexus and hypesthesia of the left ring and little fingers. Examination of the heart and lungs was again normal and an electrocardiogram failed to show any abnormalities. He was placed in head traction, with only partial relief of symptoms. A pantopaque myelogram showed a definite defect between the seventh cervical and first thoracic vertebrae on the left.[10] On August 24 a left subtotal laminectomy under local anesthesia was performed on the seventh cervical and first thoracic vertebrae. The eighth cervical nerve root was injected with 1 per cent procaine hydrochloride and retracted upward, exposing a large herniated nucleus pulposus. At this point, pressure on the disk itself caused severe pain similar in all respects to that previously experienced in the left upper chest. Care was taken to differentiate between pain produced by pressure on the disk itself and that which might result from traction on the nerve root. The large mass of herniated nucleus pulposus was then removed. The patient became ambulatory within a period of a few days, and he found that the pain in his left arm was much improved although still present to a slight extent. The pain which he had previously experienced in the precordial region had completely disappeared. At the time of discharge from the hospital on September 22 he was entirely asymptomatic.

While there was no doubt from the clinical findings that this man had a herniated nucleus pulposus, it must be admitted that the first operation was undertaken with some apprehension by the surgeon (F. M.) even though he was well aware that such a lesion could cause pain similar to angina pectoris and that cardiac studies were normal, simply because this was the first patient encountered whose pain was aggravated by walking a definite distance.

CASE 2.—A man aged 37 developed a sharp pain with a burning sensation low in the posterior aspect of the neck while moving a piano on Feb. 23, 1945. This pain continued over a prolonged period and was aggravated by any exertion which produced traction on the left shoulder. Late in March he developed attacks of sharp pain over the precordial area, the left upper chest and suprascapular region. Deep breathing definitely aggravated the pain in the left anterior chest and there was dyspnea on exertion. This pain was also produced by *coughing and sneezing*. He stated that under these conditions he felt as if his heart "was swelled" and that there was associated palpitation. About this time he also developed an almost constant numbness in the index and middle fingers and an intermittent tingling of the fourth and fifth fingers on the left.

He was admitted to O'Reilly General Hospital on July 8. The neck was held rather stiffly and the head was tilted slightly to the left. Rotation of the neck produced pain in the index and middle fingers, and pressure on the left side of the neck at the level of the sixth vertebral body over the brachial plexus caused pain in the left anterior chest. The triceps reflex was reduced and there was hypesthesia of the index and middle fingers. The heart and lungs were normal on physical and x-ray examination. The blood pressure was 120/80 and an electrocardiogram was normal. X-rays of the cervical spine showed a reversal of the normal curve and osteophyte formation along the posterior and superior edge of the body of the seventh cervical vertebra. A pantopaque myelogram of the cervical region on June 22 showed a large defect on the left between the sixth and seventh cervical vertebrae. July 3 the patient was operated on under local anesthesia and after a partial laminectomy a large herniated nucleus was found on the left side between the sixth and seventh cervical vertebrae. Pressure on the nerve root caused pain to radiate to the left arm, forearm and index finger. The nerve root was then injected with 1 per cent procaine and retracted. Pressure was then applied on the protruded disk itself and produced a sharp pain in the precordial region. However, it could not be determined with certainty that traction on the nerve root itself was not the factor that produced the precordial pain. A large mass of herniated nucleus pulposus was then removed. Following operation the patient had complete relief of pain in the precordial area and in the left arm. After a period of observation of approximately six weeks during which time he remained asymptomatic he was discharged from the hospital.

The symptoms and signs in this case were classic and no difficulty was encountered in arriving at the correct diagnosis. The cardiac consultation was obtained only for the sake of completeness.

CASE 3.—A woman aged 40 first developed attacks of sharp pain in the chest at the level of the fifth rib just to the left of the sternum in January 1945. They were not particularly severe and disappeared after a few days so she did not consult a physician. However on July 9 she was awakened by a "stabbing pain in her heart," which quickly changed to become cramping and viselike in character. The pain radiated through the left chest to the region of the scapular and thence to the shoulder and neck, producing a choking sensation, thence into the left side of the face, to the back of the neck, to the occipital region and finally down the medial (ulnar) aspect of the arm. The attacks at first would last from fifteen to thirty minutes and were associated with dyspnea but not with palpitation. The pain was not affected by position but occurred both on exertion and while the patient was in bed. At the end of four days the pain became practically constant and she was admitted to O'Reilly General Hospital on July 11.

On detailed questioning she admitted to some stiffness in the neck and numbness and tingling in the index finger of the

10. This herniated nucleus pulposus was one space lower than the first in spite of the fact that hypesthesia was in the same dermatome, a phenomenon as yet unexplained.

left hand There was no history of trauma to the neck or head On examination it was noted that she held her neck rather stiffly while she walked. The heart and lungs were found to be normal on physical and x-ray examination, and the blood pressure was 106/66 There was hypesthesia to cotton and hypalgesia to pin prick over the precordial area and over the index finger Pressure over the anterolateral aspect of the neck at the level of the sixth cervical body produced sharp pain in the precordial region and down the left arm to the medial side of the hand There was no fever or leukocytosis and the sedimentation rate was normal X-rays of the neck showed a definite reversed curve at the level of the sixth cervical body (fig 1) and a pantopaque myelogram showed a small but definite lateral defect on the left side and a defect in the midline between the sixth and seventh cervical vertebrae (fig 2)

She was placed on bed rest with constant neck traction and obtained some relief from the precordial pain However, because the pain persisted and because it was incapacitating, she was operated on, September 17 Under local anesthesia a subtotal laminectomy of the sixth and seventh cervical laminas was done and the nerve root was retracted Pressure on the seventh cervical nerve root reproduced severe pain in the precordial area and in the left arm When the nerve root was better exposed it was seen to be compressed and flattened by a small hard mass anterior to it. Between the bodies of the sixth and seventh vertebrae a hard protrusion of the disk was found, extending from the midline toward the left, in the center of which was a small soft spike of herniated nucleus pulposus just medial to the intervertebral foramen The nerve was decompressed by removal of the herniated nucleus pulposus and a portion of the hard nodule. Following operation the patient had complete relief from all her pain At discharge, two months later, she still had some soreness at the site of the operative incision but no other symptoms

Fig 1 (case 3) —Lateral view of cervical spine showing segmental reversal of normal curvature at level of sixth and seventh cervical vertebrae

The widespread pain was the conspicuous feature of this case and could have been confusing had not the findings been typical of a herniated sixth cervical nucleus pulposus No definite explanation can be given for the pain in the face any more than one can explain the pain over the heart This is not the only patient with pain in the face who has been observed It was not carried over the sympathetic nerves in a similar case, for a dorsal sympathetic block failed to give relief

CASE 4—An officer aged 36, admitted to O Reilly General Hospital on Feb 11, 1945, while pulling a sled and carrying an 80 pound pack on his back during February 1944 developed an acute severe pain in the left shoulder with radiation down the inner surface of the arm and numbness and tingling of the fourth and fifth fingers of that hand On eliminating excessive exertion he was relieved of this pain but again in July 1944 while under physical stress he experienced a similar pain Because of frequent repetitions of such experiences he was hospitalized in February 1945 Physical examination revealed limitation of motion of the neck, spasm of the left trapezius muscle with elevation of the left shoulder atrophy of the upper arm and reduction of the triceps jerk Pressure over the seventh cervical root reproduced the pain in the arm X-ray of the cervical spine revealed a loss of the normal cervical curve and a narrowing of the intervertebral space between the sixth and seventh cervical vertebrae (fig 3) A pantopaque myelogram revealed a large defect between the sixth and seventh cervical vertebrae on the left (fig 4)

Fig 2 (case 3) —Pantopaque myelogram of cervical region demonstrating a definite midline defect and a slight left lateral defect between the sixth and seventh cervical vertebrae

Cervical traction failed to give relief from pain, so under local anesthesia a partial laminectomy was performed on February 24 on the left side with removal of the protruding portions of the nucleus pulposus between the sixth and seventh cervical vertebrae Following this procedure he obtained considerable but not complete relief from the pain in the left shoulder and arm. About the first of July he developed attacks of pain extending from the left shoulder down over the left chest to the level of the nipple. The attacks were associated with definite dyspnea on attempted deep breathing and would occur both on exertion and while at rest Examination revealed that the abnormalities which were present before operation had recurred. Physical and x-ray examinations of the heart were normal and the blood pressure was 138/86 There was a definite lag of the left upper chest on deep inspiration without any evidence of pulmonary pathologic change. Blood cytologic examination sedimentation rate and an electrocardiogram were normal Pressure over the left anterolateral aspect of the neck at the level of the sixth vertebral body reproduced an attack of pain over the precordial area It was believed that a recurrence of the protruded disk had occurred and the pain was relieved fairly promptly by neck traction Because relief of the original pain was not complete, he was retired from the army Aug 11, 1945

This case is of interest because of the fact that precordial pain had not existed prior to operation Recurrence of the findings which had been present before operation, the ability to reproduce the pain by pressure

over the brachial plexus and a normal cardiac study were conclusive evidence that a recurrent herniation of the nucleus pulposus had occurred or that one of the other lower cervical disks had ruptured, as in case 1

CASE 5.—A regular army officer aged 53 was admitted to O'Reilly General Hospital on March 10, 1944 from an overseas general hospital with a diagnosis of angina pectoris He had

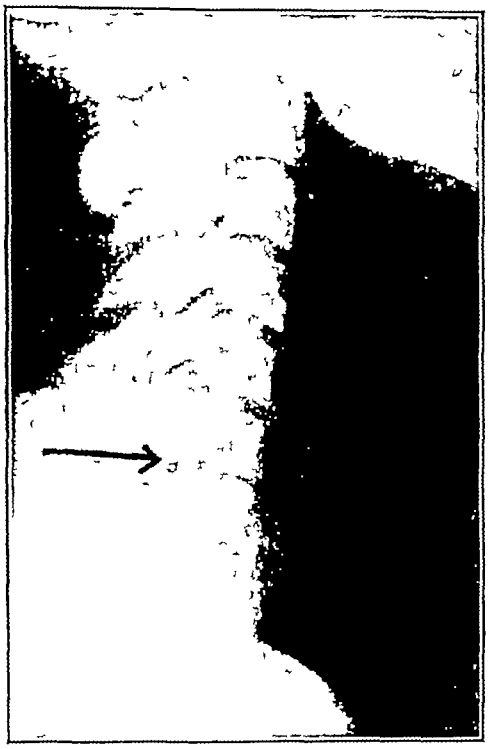

Fig 3 (case 4).—Left lateral view of cervical spine showing loss of normal curvature in lower portion and decrease of the intervertebral space between sixth and seventh cervical vertebrae.

been in an automobile accident on January 3 but did not receive any obvious injuries Following that, however, he noticed mild discomfort in the neck, precordial region and left arm which was of insufficient severity to cause him to consult a physician At about 6 o'clock on the morning of January 9 the patient was awakened from sleep by an agonizing pain in the precordial region which he described as being constricting in nature There was associated radiation of pain, numbness and tingling down the left arm to the fingers The pain persisted for about one and one-half hours before he was admitted to an overseas hospital where he appeared anxious and considered himself to be seriously ill The pain was of such severity so as to require a narcotic for relief

Examination of the heart and lungs at that time was reported as normal, and the blood pressure was 130/70 Urine, blood counts, sedimentation rates, repeated electrocardiograms and x-ray of the chest were found to be within normal limits and there was no evidence of more arteriosclerosis than was consistent with his age. Following the original attack, which lasted several hours, his exercise tolerance was not found to be altered and exercise did not necessarily produce an attack of pain However, he continued to have recurrent attacks of precordial pain which were not relieved by glyceryl trinitrate. Nevertheless, a diagnosis of angina pectoris was made and he was evacuated to the United States

On arrival here he was much better He had found that lying on two pillows so that his neck was flexed relieved the precordial pain completely The attacks of pain were mild and had it not been for his anxiety over his condition they would not have been incapacitating Examination here confirmed that there were no abnormalities in the heart, and repeated electrocardiographic studies were normal Moreover, it was then found that pressure over the brachial plexus on the left at the level of the seventh cervical root produced pain which radiated to the anterior chest and down the left arm There was limitation of motion of the neck, but no motor, sensory or reflex changes were found in the left arm X-rays of the cervical spine demonstrated a narrowing of the joint space between the sixth and seventh cervical vertebrae and an encroachment on the intervertebral foramen on the left side at this level by osteophyte formation A pantopaque myelogram confirmed the diagnosis of a rupture of the sixth cervical disk on the left (fig 5) It was apparent that the patient's complaints were not of sufficient severity to warrant operation, so conservative treatment (neck traction) was begun He was completely reassured regarding the cause of his pain and his anxiety concerning heart disease was relieved As time progressed his precordial pain almost entirely ceased and he was retired from the Army on length of service

Here again the ability to reproduce the precordial pain by pressure over the affected nerve root was the main factor in making the diagnosis, which was confirmed by myelography In addition the pain, when carefully analyzed, was not found to be precipitated by the usual factors which bring on true angina pectoris

CASE 6.—An officer aged 65 was first examined as an outpatient at O'Reilly General Hospital on Dec. 15, 1944 because of repeated attacks of precordial pain which had been previously diagnosed as angina pectoris Approximately ten years prior to this date he had suffered attacks of pain localized to the left shoulder over a period of several months which was diagnosed as bursitis In 1936 he began to have attacks of pain radiating from the left shoulder down the arm to the fingers, and since 1940 he had had an almost constant mild sensation of numbness in the fourth and fifth fingers of the left hand In 1939 the distribution of the attacks of shoulder pain spread to involve the upper precordial area He related the attacks of pain to exertion and thought that he obtained relief on rest. But he had also had similar attacks in bed at night for several years and on at least eight occasions during the year 1944 For a period of approximately two years he had noticed some discomfort and stiffness in the left side of the neck occurring particularly in bed at night. The attacks of precordial pain were not associated with real dyspnea and he had not noticed any palpitation

Fig 4 (case 4).—Pantopaque myelogram of cervical region in anteroposterior view showing a large defect between the sixth and seventh cervical vertebrae on the left.

In January 1944 he consulted a physician because of the attacks of precordial pain and was told that he had angina pectoris Limitation of activity and glyceryl trinitrate were prescribed He found that he did obtain some relief from glyceryl trinitrate but only after a lapse of at least ten minutes and when associated with cessation of activity In addition to the foregoing symptoms he had also suffered repeated attacks of low back pain with radiation down the posterior aspect of the left leg, which were also relieved by rest

On December 2 during the course of an emotional upset he had a severe and incapacitating attack of precordial pain with radiation to the left shoulder and down to the fingers The

pain persisted about three hours, was not relieved by glyceryl trinitrate or rest in bed and was ameliorated only by a hypodermic injection of morphine. The next day he noticed some soreness in the left shoulder and arm but otherwise felt well. He remained in bed for five days and then returned to his duty without further incapacitation. At the time of our interview and examination on December 15 he was apprehensive over his condition and deeply concerned about having severe heart disease. The lungs were clear, the heart was normal by physical and x-ray examination, the pulse rate was 100 and the blood pressure was 132/80. The peripheral and the retinal arteries showed only minor evidence of sclerosis, which was considered to be consistent with his age. Pressure over the neck just lateral to the sixth cervical body produced a sharp pain radiating down the left arm to the 4th and 5th fingers. An electrocardiogram taken on December 16 was normal (fig. 6), as were tracings which had been taken over a period of five days following the acute episode on December 2. The blood cytologic condition and sedimentation rate were normal. X-rays of the cervical spine showed evidence of reduction of the intervertebral space between the fifth and sixth and the sixth and seventh cervical vertebrae with lipping of the edges of the intervertebral bodies (fig. 7) and the presence of osteophytes on the left in the intervertebral foramens at those levels.

Fig. 5 (case 5).—Pantopaque myelogram of cervical region demonstrating large defect on left between sixth and seventh cervical vertebrae.

The patient was put through rather strenuous exercise tolerance tests, including a brisk uphill walk of about ½ mile on a cold day without the production of precordial pain. A Master's[11] two-step test, using 22 step ups, was then done. There was no significant change in pulse rate, blood pressure or electrocardiographic tracings taken immediately after exercise (fig. 8) and at two, four and eight minutes after exercise. Because of the presence of extensive arthritic changes and as the patient had suffered only one severe attack of pain, surgery was not considered advisable and conservative measures were advised. The important consideration was the elimination of the patient's anxiety concerning heart disease and he went away remarkably relieved.

It must be admitted that the evidence in favor of a diagnosis of a herniated nucleus pulposus is not entirely complete in that there were no reflex or sensory changes in the arm and in that a myelogram was not done. On the other hand, the evidence against angina pectoris is quite strong—namely the fact that the pain was not produced consistently by a given amount of exertion and that the heart was normal on physical and electrocardiographic examination.

CASE 7.—An officer aged 58 was at work at his desk on July 4, 1945 when he experienced sharp pain in the left shoulder which shortly also involved the right shoulder region. The pain rapidly became quite severe and was associated with dyspnea, sweating and an "ashen" color. He was observed by a physician who was working in the next office. The attack lasted approximately twenty minutes, and except for a short period of weakness following the attack he then remained asymptomatic. Because a coronary occlusion was suspected, he was further examined in detail on July 10. On that date the heart rate and rhythm were normal, the blood pressure was 120/84 and a sedimentation rate was normal. However, the electrocardiogram showed some abnormality and a diagnosis of coronary occlusion was made.

The patient was admitted to O'Reilly General Hospital on July 13 as a litter patient. At the time of our examination he was asymptomatic and quite comfortable. On detailed questioning he admitted to having had intermittent minor attacks of stiffness of the neck over a period of several months. Physical and x-ray examinations of the heart and lungs were normal. Pressure over the anterolateral border of the fifth cervical vertebral body reproduced pain identical with that which he had experienced in both shoulders. X-rays of the cervical spine showed a narrowing of the space between the fourth and fifth cervical vertebrae and an encroachment on the foramen on the left side in that area. Electrocardiographic tracings taken on July 10, 13, 17 and 25 and on August 1 showed a normal pattern except for a prolonged QRS time of 0.10 second. This prolongation of the QRS time was entirely dependent on a prolonged and slurred S wave. Fortunately the patient had previously had an electrocardiographic tracing on April 21, 1943 during a period of hospitalization for an attack of acute tonsilitis. This was obtained and was found to show exactly the same pattern as the tracings taken in July 1945. This abnormality has been shown by Willius, Dry and Reeser[12] to be of no clinical significance if it can be shown to be of more than a year's duration. Certainly in this case it could not be considered of any clinical significance. The patient remained asymptomatic and after a period of observation with normal activity he was completely reassured as to his cardiac condition and discharged from the hospital on August 1.

### COMMENT

From our experience we think that in all patients suspected of having either angina pectoris or coronary occlusion in whom the symptoms, physical signs and laboratory examinations are not conclusive the presence of a rupture of one of the lower cervical disks with herniation of the nucleus pulposus should be suspected. The historical points of interest in such cases are persistent or repeated attacks of discomfort

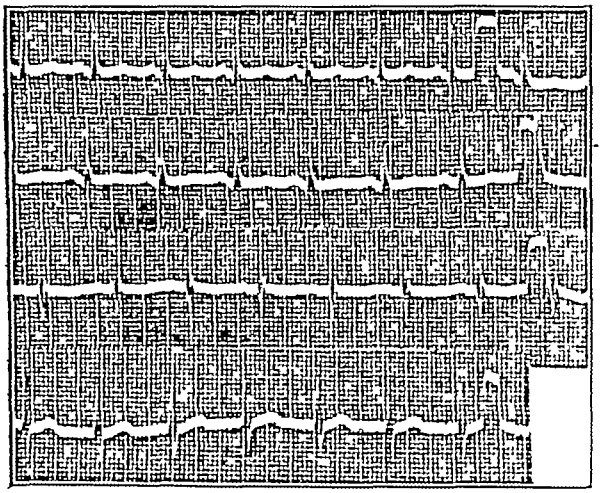

Fig. 6 (case 6).—Normal tracing at rest.

11 Masters, A. M., Freedman, R., and Dack, S.: The Electrocardiogram After Standard Exercise as a Functional Test of the Heart, Am. Heart J. 24:777, 1942.

12 Willius, F. A., Dry, T. J., and Reeser, R., Jr.: Life Expectancy in Conductive Disturbances Affecting the Ventricular Complex of the Electrocardiogram, Arch. Int. Med. 67:1008 (May) 1941.

in the neck, shoulders, precordium and arm, persistent or repeated attacks of numbness in the fingers, the relationship of the pain to exertion which causes a strain on the neck or shoulder region, and the occurrence of attacks of pain while the patient is in bed The history of trauma to the neck when present may

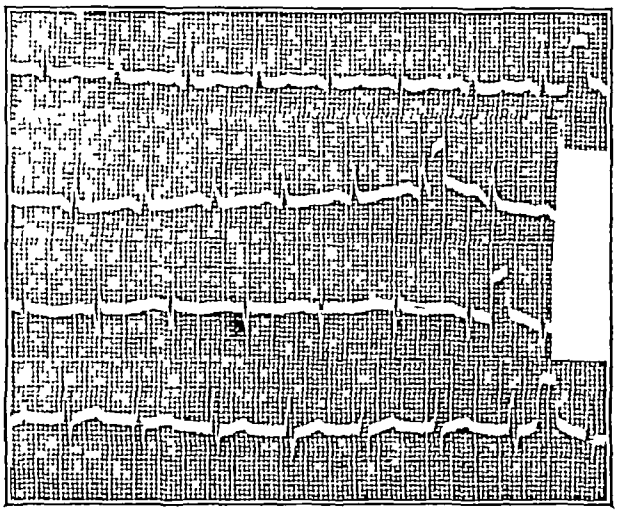

Fig 7 (case 6) —Tracing immediately after exercise (Master's two-step test) the same as before exercise

be quite helpful, but it is often absent The absence of physical and laboratory signs of coronary disease, a normal exercise tolerance and lack of relief by glyceryl trinitrate should then make the physician highly suspicious of the possibility of a ruptured cervical disk If the patient is seen during an attack, dyspnea and diminished respiratory excursion in the upper thorax may be observed Atrophy of the pectorals, biceps, triceps or intrinsic muscles of the hand may be noted when the disease has been present over a long period The pain can frequently be reproduced by pressure on the affected nerve root in the brachial plexus and by pressure on the head X-ray studies of the neck are in most instances confirmatory of the diagnosis of a ruptured cervical disk when such a lesion is present.

The question of why certain patients with ruptured cervical disks have precordial pain as the presenting symptom or, in fact, why they have any precordial pain cannot be fully answered, and the route of the nervous pathways conducting the pain is not known Selective pressure on a certain portion of one of the lower nerve cervical roots has been thought to be the cause. Nachlas,[7] in reporting on pseudoangina resulting from arthritis in the cervical spine, presented some interesting points The medial anterior thoracic nerve, originating in the eighth cervical and first thoracic nerve roots, and the lateral anterior thoracic nerve, originating in the sixth and seventh cervical roots, innervate the pectoralis major and minor muscles These nerves of course are primarily motor in function and supposedly do not cary sensory fibers but can possess protopathic sensibility He suggested that constriction of such a nerve will produce a definite pain, diffuse in character but referable to the terminal portion of the nerve This, however, does not completely explain the sensations of tightness and the constricting type of pain of which these patients so frequently complain and which at times they refer to the heart itself It would explain the limitation of motion of the upper chest and pain on deep inspiration Our observation in 1 case (case 1) at operation that pressure on the annulus fibrosus reproduced the precordial pain is of course only 1 isolated instance of such a phenomenon, but it was quite striking and definite. However, the exact pathway of conduction of precordial pain in the syndrome of ruptured cervical disks must remain as yet in the field of conjecture, much as does the pathway of the pain of coronary occlusion itself with its various areas of distribution from precordium to shoulder, upper extremities, neck and abdomen

Three of the patients (5, 6 and 7) had been previously diagnosed as definitely having coronary heart disease prior to coming under our observation One patient (patient 1) was suspected of having angina pectoris at the time of his original examination in this hospital, even though the examiner recognized the possibility that the pain could be produced by a lesion of a cervical disk The other 3 patients (2, 3 and 4), while not seriously considered as having coronary artery disease, had a type of pain which at times was quite suggestive of such a disorder Three of these patients (1, 2 and 3) who were operated on and the nerve root decompressed by removal of a herniated nucleus pulposus had complete relief of pain following surgery Patient 4, who suffered with pain in the left arm without precordial discomfort, was relieved by operation for a period and developed precordial pain only after he developed a recurrence of the herniated nucleus pulposus but was relieved by neck traction The three patients (5, 6 and 7) who did not undergo surgery were given reassurance in regard to their cardiac status and obtained relief of anxiety concerning their supposed heart disease.

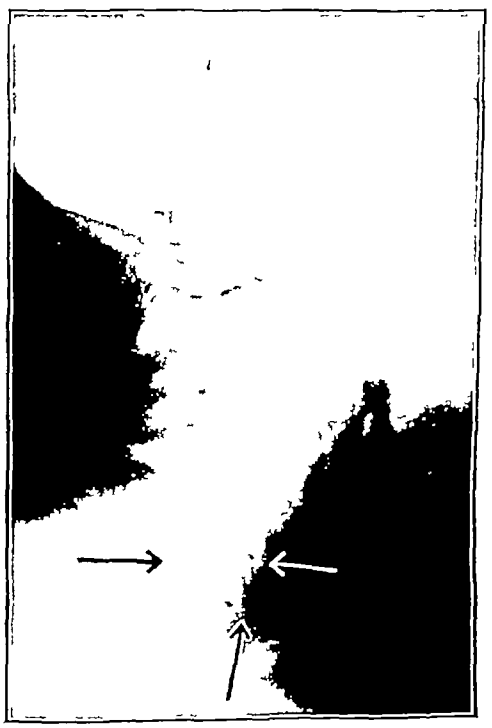

Fig 8 (case 6) —Lateral view of cervical spine showing a loss of normal curvature in lower portion a reduction of the intervertebral spaces between the fifth and sixth and the sixth and seventh cervical vertebrae and evidence of localized arthritis in those areas.

A detailed discussion of when to operate on patients with ruptured cervical disks producing precordial pain is not within the scope of this paper, but the indications for surgery are the same as those of any ruptured cervical disk which produces arm and neck pain and resolves itself into the question of how severe and how

frequent are the attacks of pain, the amount of relief obtained by conservative measures and how much relief can be expected from surgery We do feel that the results of surgery, when extensive arthritic changes can be shown by x-ray and when hard calcified nodules are present, will not be as satisfactory as in the cases in which a soft mass of herniated nucleus pulposus is present The important point, however, is the differential diagnosis between symptoms of precordial pain occurring as a result of a ruptured cervical disk and those which result from coronary artery disease Needless to say, the difference in the prognosis should be clearly explained to the patient, for it is just as important to relieve one's anxiety as it is to relieve one's pain

### SUMMARY AND CONCLUSIONS

1 Precordial pain simulating that of coronary artery disease is frequently produced by a ruptured intervertebral disk in the lower cervical region

2 The differential diagnosis of these two conditions is of grave importance to the patient and can be made on the basis of history, physical findings, electrocardiographic studies and x-ray studies of the cervical spine

3 Seven patients with ruptured cervical disks with precordial pain as their presenting symptom were studied in detail Three were operated on with relief of precordial pain and the other 4 were reassured with regard to their cardiac status and prognosis as to life expectancy

4 The nerve pathway for the production of precordial pain by rupture of a lower cervical disk is not definitely known This particular pain can be reproduced at operation and has been reproduced in 1 instance by pressure on the intervertebral disk itself

## FACTS AND FALLACIES IN THE INTEGRATION OF NATIONAL VOLUNTARY HEALTH AGENCIES

D B ARMSTRONG M D Sc.D
New York

*In the end they will lay their freedom at our feet and say to us 'Make us your slaves but feed us*

*—Dostoyevsky*

For at least forty years questions have been asked as to the proper status of national voluntary health agencies Should they continue to be essentially independent organizations? Should their present loose federation be strengthened? Should they be merged? What degree of integration for expert staffing, for economy, for efficiency, for public relations, for education and especially for fund raising would be most advantageous on all levels, national, state and local?

Inevitably two opposing conclusions have been reached regarding merger, because the arguments for and against merger are based on two conflicting philosophies The general public, unaware of the deep roots of this conflict, may well be confused by the brightly colored foliage displayed for hoped-for acceptance. The full flower from one of these roots has recently bloomed in the form of a volume entitled "Voluntary Health Agencies—An Interpretative Study," generally known as the Gunn-Platt Report This study was made technically under the auspices of the National Health Council[1] but was actually financed by the Rockefeller Foundation, of which Mr Selskar Gunn, one of the authors, was a vice president until his untimely death The study was completed by his assistant Philip S Platt, Ph D The authors and not the council (or the members of their "advisory committee," of which I was one) assume responsibility for the recommendations which conclude the report and which are based on inquiries by two skilled laymen under the direction of a committee also under lay leadership

Some of the recommendations and data featured in the report have resulted in hostile criticism of certain national voluntary health agencies, especially as to their programs and expenditures and their methods of fund raising Although the Gunn-Platt Report says that the public could and should give more, not less, than it now gives to private agency health work and admits that decreasing mortality and morbidity rates are substantially due to the work of the national voluntary health agencies, interpreters of the report have implied that the funds contributed by the public to certain major agencies have been at least in part used unwisely More centralization and eventual merger are advocated as the answer to these alleged adverse conditions The report itself concludes by recommending "the pooling of the present separate, competitive and confusing appeals into a uniform nationwide campaign
effective on the local, state and national levels"

The Gunn-Platt Report, however, is only an episode, constructive and useful in some respects, contradictory and redundant in others, in the long history of the voluntary health movement My intention in this paper is to discuss not the Gunn-Platt Report particularly but the truly basic principles involved in the controversy on which this report has for the moment focused both lay and professional attention

### FREEDOM OR MERGER

Cooperation is fundamental to optimum success in any effort Improvement in the health of the individual is the proper goal of every nurse, every physician, every hospital, every private and official health agency But obviously, specialization is both wise and necessary In a coordinated medical and surgical clinic service the patient benefits from division of function Similarly in the National Health Council its member agencies function through analogous specialization Yet the council makes it possible for its members to do many things jointly which they could do less well or not at all alone Many useful joint activities were initiated in its early years, in part abandoned for lack of funds Many untouched fields for joint action could and should be developed The council has been aware of the value of expansion and further coordination from the beginning

It was timely to have now a restatement of program and an increase in resources This seemed hardly to require the costly and intricate study undertaken by the self-created committee of the council or five years

Dr Armstrong was formerly president and first executive officer of the National Health Council.

1 The National Health Council maintains headquarters at 1790 Broadway New York where are housed a number of its member agencies and where numerous common services are maintained The agencies composing the council are as follows Active members American Epilepsy League American Eugenics Society American Heart Association American Public Health Association American Red Cross American Social Hygiene Association American Cancer Society, American Society for the Hard of Hearing Conference of State and Provincial Health Authorities of North America Maternity Center Association National Committee of Health Council Executives, National Committee for Mental Hygiene National Organization for Public Health Nursing National Safety Council National Society for the Prevention of Blindness National Tuberculosis Association Associate Members American Nurses' Association, American Association of Medical Social Workers American Diabetes Association, Planned Parenthood Federation of America Advisory members U S Children's Bureau U S Public Health Service

of scurrying around the country with an expenditure of upward of $100,000 However, the useful though obvious suggestions in the report, which could surely have been outlined in a few hours by any one familiar with the field, should be acted on promptly

At no time in the history of the council has there been any conflict as to the desirability and value of such joint activities But from the very start of the council there was conflict about the desirability of merger of the voluntary agencies Several reports based on earlier surveys had merger as their aim, the current one being only the latest attempt

The argument of this paper is that the wish for merger is based on erroneous concepts and that merger is potentially destructive of all volunteer agencies To create a unit in which the voluntary health agencies were anonymous parts would be a catastrophic sacrifice of one of our traditions which must be maintained if our country is to continue dedicated to freedom In our framework merger is impossible and if it were possible it would be the wrong thing, both practically and theoretically, to do, as it would surely sever the roots now deep in the soil of popular interest and support

### THE RECURRENT DREAM

Yet there are attractive arguments for merger There are pointed, neat, specious arguments against independence About forty years ago, conspicuous leaders in the public health field began expressing the opinion that there were too many organizations in the area of voluntary effort They said duplication was wasteful and uneconomical and that competing for funds was not the best way to tap the full resources of the private contributor They advocated merger into one organization as soon as possible on a national, state and local basis This was to match a similar integration of official agencies looking forward to the merger of the United States Public Health Service and the Children's Bureau, for instance, and the broad expansion of the programs of state and local health departments

At that time there were developed, among other plans beautiful colored charts pseudosimple and pseudological convincing pyramids of unification I myself enjoyed working on such charts and making guesses about quick-working, magic formulas for merger I made the study, under the direction of Vincent, Farrand, Frankel Snow and others that resulted in the establishment of the National Health Council in 1921 and was its first executive officer and later vice president and president of the council I am, or have been, a member of numerous committees and boards of its member agencies and know intimately the history of the attempts at consolidation and their failure It is presumably because of this long and varied contact with this field that I have been repeatedly urged by friends and associates to record my views on the problem, and hence this article

Indeed, the primary objective of the council in the early 1920's was merger While many other things attempted succeeded, merging failed completely In the mid 1930's another major effort at amalgamation into one agency was made and again failed Both these attempts were direct and honest approaches and convinced some participants and observers, at least, of the futility and lack of wisdom of the effort Now, through the Gunn-Platt study and report, a third indirect and more devious approach is being made, this time working from the periphery inward It is our opinion that this too is doomed to failure and that the idea is now "going down for the third time" The next time it is fished out of the roiled waters it should, it is to be hoped, be recognized as "a dead cat"

The value of and necessity for separate and independent national voluntary health organizations have been clearly demonstrated by the history of the National Health Council These agencies are indeed a natural manifestation of the American ideology of free enterprise No amount of venturing with foundation resources by crusading angel laymen into the fields of medicine and preventive medicine will alter this background Typical American initiative in the public health field is not apt to be diverted by the creation of a "top-flight," conspicuous, camouflaging superstructure, well intentioned but misled into believing that the voluntary health executives are simply "entrenched racketeers raising money to pay their own salaries" It is not likely that the American public will be seriously fooled by graphic, undermining attacks on existing successful independent voluntary health agencies or by an organized ballyhoo led by "public relations experts" Certainly, if such a social change should result from this combination of effort, it would mean that here, as in other nations, the egoistic, table pounding commissars will have paved the way for the Dictator

To many familiar with the past history of the National Health Council it was perfectly clear that this third attempt since 1920 at amalgamation of voluntary health work was not only "barking up the wrong tree" but baying at a dead tree, with little anticipation of finding 'possums in its leafless branches

Let us consider some facts and fallacies about volunteer agencies and see why they lead us to the conclusion that merger is both improbable and wholly unwise

### FACTS

1 It is a fact that the national voluntary health agencies can do and are doing advantageously certain things in common These include not only common mechanical services such as rentals, accounting, supplies, telephone service, shipping and library for which the council has operated over many years a substantial budget amounting annually to nearly three hundred thousand dollars They also include many other mutual interests which can, to a degree at least be best served in common, such as certain phases of research, the development of health educational activities, personnel recruiting and management, statistical services, certain phases of state and local field organization and control, and increased cooperation with nonmember organizations Projects in all these fields have been initiated from time to time and carried forward with some degree of satisfaction and accomplishment Of course not all have persisted, mainly for lack of staff and funds

Much more can be done in these directions on a basis of voluntary cooperation through the National Health Council on the part of the independent agencies It is fortunate that, following the recent survey, there now appears to be more foundation money available for these purposes, and it certainly is to be hoped that adequate staff can be secured for the expansion of this type of program

2 It is a fact that resources for the several important voluntary health movements are uneven This is of course inevitable It is easier to raise money for infantile paralysis, for instance, than it is for venereal disease control The public doesn't like to hear any more than it has to about the latter, and it is difficult to dramatize

It is probable that there are important causes such as venereal disease control that will always need special help and that cannot raise funds as adequately by popular appeal as do the infantile paralysis, tuberculosis, cancer and other movements Venereal disease efforts may have to find their chief support from large givers, or arrangements might be made whereby they could share in the more generously financed movements, especially those with unusually successful money-raising devices, such as those used by the National Foundation for Infantile Paralysis or such as the seal sale so effectively utilized by the National Tuberculosis Association

Of course it should be realized that criticism of the well-to-do agencies because of their success in fund raising, and an effort to encourage or force them to carry their impoverished colleagues might readily, if pressed too far, induce an element of public deception and might also actually signify an extension into this field of the prevalent "soak the rich" philosophy

3 It is a fact that previous efforts at voluntary health consolidation failed, and for inherent, basic reasons The executives and boards of some of the agencies have in the past professed to believe in the consolidation idea, and certain of them still do They say that "the time is not ripe" or "we must move slowly" Many of them don't face the facts In reality such a unification on the national level would be contrary to the American tradition and possible only in a regimented society Hitler or Stalin could force it and no doubt would It is however decidedly American to promote and finance separate agencies to which the people can give in a way that reflects their special interests If this expensive but vital privilege is withdrawn, they will probably show their resentment by nonparticipation Separate health movements are a part of the American competitive, free enterprise, democratic system, involving unfortunate but inevitable duplicatory costs that are characteristic of democracy in all its manifestations State and local governments are costly too, but complete federal control would cost us our freedom

4 It is a fact that there are in our country two kinds of people who want the consolidation of voluntary health agencies and who are willing to sacrifice freedom to regimentation with the object of economy, efficiency and more complete control The first group is composed of that portion of the social workers, statisticians and community organizers who are communistically inclined This same group naturally favors other efforts at socialization and the current trends in government and out of it The other group is made up of business executives who favor a unification of appeals, who like the local community chest idea because it means fewer requests for appropriations and because it means that actually in most instances they and their businesses will have to give less in total than they would if faced with a number of separate demands Actually these two groups have the same collectivistic ideology and the same desire for organized monopoly However, the leading executive or political leader who wants private enterprise in business but who is willing to tolerate the regimentation of medicine, of public health and of voluntary social effort is toying with the camel whose nose is already in the tent

## FALLACIES

On the other side, it is clear that in our current thinking about national health federation there are a number of fallacies prevalent, some of them featured in and highly publicized by the Gunn-Platt Report They are not new fallacies They were evident also in earlier National Health Council history We should have learned to recognize them long ago Among them are

1 It is a fallacy to assume that the public is averse to multiple agencies The facts of course speak for themselves The individual citizen generously supports the agency or agencies in which he is especially interested, often because of some personal or family experience During the last few years, when the public was supposed to be consciously overburdened and annoyed, agencies have developed more rapidly in number and volume than in any equal prior period Never were so many new programs launched Never have separate movements met with such generous financial support from the public The tuberculosis seal sale reached an all time high in 1945 The infantile paralysis control movement has grown by leaps and bounds Two separate national cancer drives within the last two years have raised approximately $8,000,000, and another one is now being terminated for an even larger amount Public interest and sympathy increase rather than shrink

2 It is a fallacy to claim that the trend is all toward consolidation Unification is falsely said to be "in the cards" This false assumption is based partly on the experience of the National War Fund, which was a successful war phenomenon—a collectivistic device necessarily borrowed from our enemies in order to fight them on their own grounds, and not the only one so borrowed This fund met with partial failure as soon as peace was certain If Americanism is still strong it will drop that and other wartime bits of collectivism and statism

There are many evidences of similar trends away from consolidation in recent experience Tuberculosis societies have here and there been forced to try merging their local fund-raising programs with community chests and have later had to withdraw and return to an independent basis in order to acquire adequate resources and regain popular interest and support The movement toward unification was furthered (in the early 1930's) by a rather widespread admiration in this country for European collective and socialization procedures In New York City, for instance, under the leadership of a subsequent great New Dealer Harry Hopkins, the New York Tuberculosis and Health Association was able to bring into its group, in addition to its tuberculosis program, the work of those concerned with heart disease, social hygiene, industrial hygiene, dental hygiene and diabetes Most of us thought it was a good idea at the time and worked with Hopkins for it Subsequent history, however, raises skepticism as to the wisdom of the attempt First the diabetes group withdrew and established the New York Diabetes Association, with more adequate funds than it could realize in the merger Then the heart group left the association and started out on its own, with a program that promises to raise a great deal more money than was ever made available for it as a part of the association Dental interests are now threatening to withdraw and might be very wise to do so, so far as their fund-raising activities are concerned

In reality, the trend on both the national and the local level is definitely away from consolidation, though probably ten years from now some new Messiah with a Jehovah complex will again drag out the leaky unifi-

cation bagpipe, to play again the "consolidation blues," perhaps with a foundation again paying the piper

3 It is a peculiarly silly fallacy that the amount of funds that the public will make available for voluntary health effort can be increased by burying the special appeals in an anonymous approach This hardly seems to call for argument, though this assumption is often made or implied It seems quite certain, as mentioned earlier, that one sure way to destroy the voluntary health movement and its public support is to attempt such unanimity through consolidation on a national level The only people who would be pleased would be those who view all private social effort as a racket (though they generally are for private effort in all other channels) or those who would like to see the voluntary movement destroyed in order that the whole health program might be taken over by the state, and particularly by the expanding federal authorities As a matter of fact such motivation, conscious or unconscious, may well be a factor in this third attempt at consolidation It would be fatal for the voluntary health agencies to give up their independent, free access to public support It is ridiculous to assume that they would get more rather than less by a united appeal Those who advocate this should reread Dostoyevsky's chapter on "The Grand Inquisitor" in The Brothers Karamazov, where the people cried to the great leader, in effect, "We lay our freedom at your feet give us bread," hoping and expecting to get more bread that way, but realizing later, as presented more fully by Dostoyevsky in The Possessed, that in giving up their freedom they had also sacrificed their bread Of course this same formula has more recently been demonstrated by the Fascists in Italy, the Nazis in Germany, and the Communists in Russia Those who adopt this formula certainly lose their freedom, but the bread is yet to materialize, at least in comparison with the loaf that free enterprise produces in America

4 It is also a fallacious assumption that the communization of effort and resources in our country is inevitable or that seemingly worldwide trends toward socialization must be followed here Must free enterprise be killed off in social effort? Is free enterprise doomed in business? If so, then only one end is possible—an end clearly exemplified in Europe at the terminus of a road down which other nations, including the British, now seem determined to travel This route was perhaps most compactly described by Hayek when he said that the road to communistic hell is paved with well intentioned socialistic or collectivistic experimentation

It is said, we believe fallaciously, that socialization in medicine and public health is inevitably coming on a national scale as regards official activities, and that a parallel development is therefore essential in the voluntary field This is a two-barreled fallacy, and the triggers are pulled by the same individuals The same small group of persons are pushing the socialization idea through both official and voluntary channels They work behind the scenes for the destruction of American institutions of freedom It is important that their aims and activities should be understood by us all

For instance, on the national level and on the official side there are in the legislative Senatorial hotbed a variety of "plants" that might be labeled "German born," "Russia bitten," "American gullible"—all fit subjects for Thurber's series of sketches of modern Flora in the *New Yorker* These Senatorial "plants" are probably "forced" growths rather than vigorous natural fermenters of statism on the medical level They are root fed and fertilized by horticultural experts working behind the scenes in the country's social security hothouse

In the private agency field a clever, "leftish" lay leadership in the American Public Health Association, for instance, has unfortunately succeeded in putting this association on record as supporting the national socialization of medical care, even though most of its members are naturally individualistic medical men Many of these physicians, however, are health officers exposed to the ever growing influence of a centralized governmental subsidizing regime "He who pays the piper calls the tune"

It is well to be aware of these influences It would be a little ridiculous for us to have spent billions of dollars and hundreds of thousands of lives to defeat totalitarian statism in Europe and Asia and then let the collectivists in our midst conquer us with their program here at home

### HOW GREAT IS THE DANGER?

Practically, the danger of our surrendering our freedom in the health field is not very great The National Health Council has a great deal to its credit Its important services persist and flourish, although they were largely ignored in the Gunn-Platt Report, perhaps as a method of magnifying the alleged current "crisis" Certainly, the usefulness of the council can be greatly increased with the additional funds that are a sequela of the Gunn-Platt study, perhaps a justification of the study itself

There is reassuring healthy resistance to the less fortunate recommendations and interpretations of this report There is a substantial revolt in the tuberculosis field against unwarranted criticism leveled at this movement The Red Cross is said to have threatened to withdraw from the council membership if certain of the Gunn-Platt recommendations regarding local consolidation of fund raising are pressed The National Organization for Public Health Nursing has gone on record as recommending "that visiting nurse associations as well as hospitals and clinics be excluded from the proposed unification of all voluntary agencies into one organization" The National Foundation for Infantile Paralysis, smarting under unjust attacks, has apparently, and it is hoped only temporarily, laid aside plans to join the National Health Council and has for the time being joined the National Social Welfare Assembly, a similar and more comprehensive federation

The Gunn-Platt Report represents an expensive detour It has made useful comments and stirred up a great deal of suspicion and antipathy Efforts are now being made to "pull some of the chestnuts out of the fire" and some progress should be the net result, though not commensurate with the cost and the ballyhoo

### A NEW START?

Of course if the socializers and regimenters succeed in capturing the National Health Council, consideration should perhaps be given to a fresh start in voluntary health organization—a start that would be firmly based

on American enterprise and freedom, with cooperation between independent groups It might conceivably be appropriate to initiate an American health league, which could of course cooperate with the National Health Council as well as other health agencies and which would not in any way undermine the established and advantageous activities of the council Such a league might recognize from the start certain deficiencies in the makeup of the National Health Council While the council includes a number of important agencies raising large amounts of money for health, such as the American Red Cross, the National Tuberculosis Association and the American Cancer Society, it does not include other very important agencies with a vital stake in the health interests of the country, such as the National Foundation for Infantile Paralysis, the American Medical Association, the American Hospital Association, the American Dental Association and the Association of Voluntary Prepayment Plans for Hospital and Medical Care These professional groups should have had a part in the council from the beginning and should have a part now in the council or in any similar organization

Certainly such an organization should be free to oppose or discount the myth or mirage of merged fund-raising appeals on a national level, and probably under most circumstances on a local level It should also at least indirectly oppose other attempts in parallel fields to promote the socialization of medicine and the governmental domination of medical care facilities It should oppose attempts to tie up intimately medical services and therapeutic activities with public health administration, as recently endorsed by the American Public Health Association

On the more important positive side, any soundly American organization will want to maintain the independence nationally of the major voluntary movements but will at the same time wish to encourage a cooperative federation or conference procedure encompassing all the important national health and medical agencies It will want to develop on a state and local basis the proper machinery for the integration of effort, whether this is a council, a federation or an actual consolidation of agencies It will wish to promote full cooperation with official agencies and the further development of adequate public health service, including sanitation, preventive medicine, maternal and child health, nutrition, and diagnostic centers in hospitals, admitting that many such services, while supplied by local agencies, may need federal aid It will want to promote voluntary, nonprofit prepayment plans for hospitalization and medical care, in fact, it would endorse probably all the ten items in the national health program of the American Medical Association, as adopted by the Association's Board in February 1946

### THE BEST FORMULA?

To return finally to the question of fund raising, it is likely that the best formula needs to be somewhat flexible, though it must be firmly anchored to strong principles It should recognize separate and independent agencies, particularly on the national level, with independent and direct appeals to the public for funds, utilizing such appeals as fully as possible also for educational purposes It may be that certain of the agencies with weaker approaches to the public, such as the venereal disease program mentioned earlier, will need to have, more actively than in the past, mutual assistance from some of its partners, perhaps notably the tuberculosis movement with its seal sale It is conceivable that certain of the smaller agencies, working in more restricted and specialized fields, with less need for large resources, may wish to put their appeals in the hands of local community chests That of course has been tried in the past, not always with success Perhaps the experience could be improved on, though one may legitimately be somewhat skeptical about this phase of the formula even for these smaller agencies

The national agencies should use some of their funds to aid their council group in developing to the full the mechanical services that can without question be operated in common They should also, as stressed earlier, go further in experimentation with certain outgoing services such as health education by radio and films, and research

On the state and local level when it comes to fund raising, a separate approach to the public and a distinctive emphasis for different causes should be maintained Money raised as a result of separate national, state or local appeals for tuberculosis, infantile paralysis, cancer, venereal disease and other programs might be more effectively utilized in many communities if the interested, independent agencies had the advantage of a council or clearing house, or other cooperative conference machinery Such an integration the National Health Council field service might appropriately foster Any other possible experimental formulas for raising and spending funds on any level including state and local, that tend toward or represent a single unit of operation should be approached or carried forward with a great degree of caution and skepticism

It is to be hoped that within some such framework the National Health Council with its fine, if limited, record of twenty-five years, augmented perhaps by agencies not now participating, guided by the principles of freedom and democracy, may go forward toward greater accomplishments May it be aided by the obvious manifestations of wisdom and not permanently impeded by the equally manifest evidences of bad judgment on the part of those who have recently proffered their guidance to this organization and its constituent agencies

---

**Fibroblast and Acute Inflammatory Reactions**—Of all the cell types present in the loose connective tissues of the body, no cell has been quite as obstinate as the fibroblast in refusing to display clearly its potentialities under different physiological conditions Today there is little agreement concerning the role of the fibroblasts in the inflammatory reaction Moreover, the fibroblast has exhibited a particular elusiveness in displaying its relation to other cells of its kind There is little agreement as to whether there is cytoplasmic continuity from one fibroblast to another (syncytial arrangement) or whether each fibroblast is a distinct cellular entity capable of independent expression The solution of these problems would not only further clarify the abilities of the fibroblasts as a cell type but also lead to a more complete understanding of the cellular sequence involved in the inflammatory process—Pliske, Edward C The Role of the Fibroblast in Acute Inflammatory Reactions with Reference to Phagocytic Exudate Cells, in Studies in Science, edited by W C. Coker, Chapel Hill, University of North Carolina Press, 1946

cation bagpipe, to play again the "consolidation blues," perhaps with a foundation again paying the piper

3 It is a peculiarly silly fallacy that the amount of funds that the public will make available for voluntary health effort can be increased by burying the special appeals in an anonymous approach This hardly seems to call for argument, though this assumption is often made or implied It seems quite certain, as mentioned earlier, that one sure way to destroy the voluntary health movement and its public support is to attempt such unanimity through consolidation on a national level The only people who would be pleased would be those who view all private social effort as a racket (though they generally are for private effort in all other channels) or those who would like to see the voluntary movement destroyed in order that the whole health program might be taken over by the state, and particularly by the expanding federal authorities As a matter of fact such motivation, conscious or unconscious, may well be a factor in this third attempt at consolidation It would be fatal for the voluntary health agencies to give up their independent, free access to public support It is ridiculous to assume that they would get more rather than less by a united appeal Those who advocate this should reread Dostoyevsky's chapter on "The Grand Inquisitor" in The Brothers Karamazov, where the people cried to the great leader, in effect, "We lay our freedom at your feet give us bread," hoping and expecting to get more bread that way, but realizing later, as presented more fully by Dostoyevsky in The Possessed, that in giving up their freedom they had also sacrificed their bread Of course this same formula has more recently been demonstrated by the Fascists in Italy, the Nazis in Germany, and the Communists in Russia Those who adopt this formula certainly lose their freedom, but the bread is yet to materialize, at least in comparison with the loaf that free enterprise produces in America

4 It is also a fallacious assumption that the communization of effort and resources in our country is inevitable or that seemingly worldwide trends toward socialization must be followed here Must free enterprise be killed off in social effort? Is free enterprise doomed in business? If so, then only one end is possible—an end clearly exemplified in Europe at the terminus of a road down which other nations, including the British, now seem determined to travel This route was perhaps most compactly described by Hayek when he said that the road to communistic hell is paved with well intentioned socialistic or collectivistic experimentation

It is said, we believe fallaciously, that socialization in medicine and public health is inevitably coming on a national scale as regards official activities, and that a parallel development is therefore essential in the voluntary field This is a two-barreled fallacy, and the triggers are pulled by the same individuals The same small group of persons are pushing the socialization idea through both official and voluntary channels They work behind the scenes for the destruction of American institutions of freedom It is important that their aims and activities should be understood by us all

For instance, on the national level and on the official side there are in the legislative Senatorial hotbed a variety of "plants" that might be labeled "German born," "Russia bitten," "American gullible"—all fit subjects for Thurber's series of sketches of modern Flora in the *New Yorker* These Senatorial "plants" are probably "forced" growths rather than vigorous natural fermenters of statism on the medical level They are root fed and fertilized by horticultural experts working behind the scenes in the country's social security hothouse

In the private agency field a clever, "leftish" lay leadership in the American Public Health Association, for instance, has unfortunately succeeded in putting this association on record as supporting the national socialization of medical care, even though most of its members are naturally individualistic medical men Many of these physicians, however, are health officers exposed to the ever growing influence of a centralized governmental subsidizing regime "He who pays the piper calls the tune"

It is well to be aware of these influences It would be a little ridiculous for us to have spent billions of dollars and hundreds of thousands of lives to defeat totalitarian statism in Europe and Asia and then let the collectivists in our midst conquer us with their program here at home

# Clinical Notes, Suggestions and New Instruments

## THIOGLYCOLIC ACID POISONING IN CONNECTION WITH THE "COLD WAVE" PROCESS

LAWRENCE H. COTTER, M.D.
New York

For some time thioglycolic acid has been used in industry as an iron indicator with no reported ill effects on the handlers. A few years ago a process of hair curling was put on the market known as the "Cold Wave," in which this chemical is employed. There are variations in the basic solutions as put out by different manufacturers but thioglycolic acid in dilutions up to 5 per cent is a constituent of all those investigated.

By the technic employed the horny sheath of the hair fiber is softened while it is rolled round a spindle, following which it hardens into a permanent spiral. The sulfur and amino-carboxyl compounds in the keratin scales are disrupted by the thioglycolic acid, $HSCH_2COOH$, which is applied with an excess of ammonia. After varying periods the acid is washed off with water or hydrogen peroxide.

The cases in which a toxic reaction has been observed appear to be on the increase. The process is more widely advertised, and cheaper with the result that less skilled operators now employ it. Its former high price confined its use to a small clientele in the better class establishments. At the present time an outfit for home use has been out on the market, and it should be recognized as a danger in unskilled hands, and even in skilled hands to a certain proportion of the beauty seekers. Persons suffering from allergies and anemias are the most likely victims, but the acid has an established affinity for the protein molecule and liver damage to some extent may be anticipated from prolonged exposure in any individual.

The following cases were selected from a large group because it had been possible to demonstrate their lesions in the laboratory.

### REPORT OF CASES

CASE 1.—J. R., a woman aged 30, American, a hairdresser, had been employed as a demonstrator of a cold wave process. She gave a history of swelling of the face and the appearance of a diffuse rash after using the acid solution while she had an open wound on one hand. This was relieved by applications of hydrogen peroxide but became gradually worse, so that she lost weight and sleep from the constant itching. She was treated in a hospital by injections of calcium gluconate and by x-rays. When seen she had a diffuse erythema, with some edema of the eyelids and the extremities. Her skin was covered with scratch marks, and there were several necrotic areas from x-ray burns. She appeared emaciated, depressed and tremulous.

TABLE 1.—*Chemical Values in Case 1*

| | |
|---|---|
| Kline | negative |
| Blood sugar | 107 mg. per 100 cc. |
| Serum cholesterol | 243 mg. per 100 cc. |
| Serum phosphorus | 4.9 mg. per 100 cc. |
| Serum nonprotein nitrogen | 35 mg. per 100 cc. |
| Serum uric acid | 4.4 mg. per 100 cc. |
| Serum calcium | 10.4 mg. per 100 cc. |
| Serum bilirubin | 0.1 mg. per 100 cc. |
| Serum chlorides | 590 mg. per 100 cc. |
| Serum alkaline phosphatase | 2.5 Bodansky units per 100 cc. |
| Serum total proteins | 7.4 per cent |
| Serum sodium | 143 milliequivalents per liter |
| Carbon dioxide content | 56.7 volumes per cent |
| Cephalin flocculation | positive |

Laboratory investigation showed the urine amber, cloudy and acid with a specific gravity of 1.021, albumin a faint trace, sugar negative. Microscopic examination revealed scattered red and white cells.

Blood count revealed hemoglobin 13 Gm., red blood cells 3,600,000, white blood cells 9,900, neutrophils 50 per cent, lymphocytes 39 per cent, mononuclears 7 per cent, eosinophils 3 per cent and basophils 1 per cent.

The chemical values are given in table 1.

After six months the patient was still very uncomfortable and nervous, but the elevation of her phosphorus had disappeared and the cephalin flocculation was negative. Her hemoglobin had gone up to 15 Gm., but the low total granulocyte count persisted. She reported that she had gone back to her former place of employment but that entering the atmosphere where the thioglycolic acid fumes were present, without any actual contact with the solutions, had brought on a severe attack of rash and swelling. A patch test showed that she was still acutely sensitive. A test fluid was prepared by neutralizing a 5 per cent solution of chemically pure thioglycolic acid with ammonium hydroxide and diluting with distilled water to a proportion of one drop of the acid solution to 100 cc. of water. One drop was allowed to dry on the skin and remain six hours. At the end of that time there was a wheal 3 cm. in length and 2 cm. in diameter which persisted two days and left a permanently pigmented area. In addition, the patient had a running nose, swollen eyes and diffuse itching. She still suffers from extreme nervousness and complains of feeling cold. Her skin has a mottled appearance, and the areas where she had loss of skin from x-ray burns frequently break down and form running sores. She has now developed albuminuria.

TABLE 2.—*Chemical Values in Case 4*

| | |
|---|---|
| Serum bilirubin | 102 mg. per 100 cc. |
| Serum alkaline phosphatase | 6.1 Bodansky units per 100 cc. |
| Serum cholesterol | 132 mg. per 100 cc. |

TABLE 3.—*Comparative Results in Case 5*

| | | |
|---|---|---|
| In January 1946 | Serum total cholesterol | 250 mg. per 100 cc. |
| | Serum free | 73 mg. per 100 cc. |
| | Serum esters | 177 |
| | Cephalin flocculation | negative |
| In April 1946 | Serum cholesterol | 225 mg. per 100 cc. |
| | Serum free | 75 mg. per 100 cc. |
| | Serum esters | 150 |
| | Cephalin flocculation | positive |

CASE 2.—G. T., a woman aged 49, American, hairdresser, had used preparations containing thioglycolic acid in the course of her work. About a year ago she noticed swelling of her extremities and began to suffer from dizziness and severe occipital headache. These symptoms increased, with the addition of nocturia, gastrointestinal pain and a diffuse itching rash. She spent some time in a local hospital, where she was told that she had anemia. Her gastrointestinal series was negative. When seen, she had not been in contact with the acid for some months. Her headaches had improved and her skin was clear except for a pustular eruption of the scalp. The urine was normal. Her blood count was normal except for a slight leukopenia and granulopenia. Her chemical values were normal except for a strongly positive cephalin flocculation test. She was much overweight. When seen three months later she had lost 60 pounds (27 Kg.) on a diet and the dizziness and nocturia had disappeared. Her blood count was normal, and her cephalin flocculation test was positive.

CASE 3.—J. Y. R., a woman aged 52, American, a hairdresser, had not handled any thioglycolic acid preparation but had a "cold wave" of her own hair. As soon as the acid solution was applied she felt an intolerable burning sensation which persisted for three days in spite of all attempts to wash off the acid. She also had severe cramps and itching all over the body. As soon as the acute condition had subsided she was given a patch test by her doctor, with an immediate exacerbation of all her symptoms. When she again appeared normal she was given a second patch test. This time the reaction was delayed a week but was much more severe when it occurred. She had swelling of the hands and feet and enlargement of the lymph nodes of both axillas as well as the itching and burning, and her hair came out in large patches.

From the Department of Medicine, College of Physicians and Surgeons, Columbia University, and the Presbyterian Hospital, New York, New York.

When seen, she had dark patches on her skin and denuded areas of her scalp There was an anesthesia over the distribution of the seventh nerve on the right side She appeared emaciated and nervous Laboratory investigation showed a normal urine The blood count revealed a low hemoglobin and a granulopenia Her chemical values were normal except for an elevated serum cholesterol and a positive cephalin flocculation test The latter was found to be negative after three months and her symptoms had cleared up except for an intermittent burning sensation of the scalp

CASE 4—C B, a housewife, had a "cold wave" of her own hair As soon as the thioglycolic acid solution was applied she became dyspneic and noticed a diffuse itching rash with swelling of the mucous membranes She had a patch test a week later, described by her own doctor as 'positive in high dilutions' after which she suffered from nausea and vomiting and noticed a slight icteric tint of her skin Chemical investigation at that time showed the chemical values given in table 2

Blood count revealed hemoglobin 10 Gm red blood cells 3,200 000 white blood cells 3 000 There was a low granulocyte count, with some anisocytosis and some nucleated forms She made a complete recovery

CASE 5—C L M an American housewife had been under treatment for anemia for two years Her chemical values in 1944 were normal, and her physical examination was negative She complained of extreme lassitude and depression A college graduate in luxurious circumstances she resented a previously made diagnosis of 'neurasthenia Blood count revealed hemoglobin 13 Gm red blood cells 3 800 000 white blood cells 4,600 neutrophils 58 per cent lymphocytes 33 per cent, mononuclears 6 per cent, eosinophils 1 per cent basophils 2 per cent Anisocytosis and poikilocytosis were present and accentuated The platelets were scanty The patient was given systematic liver and nicotinic acid therapy and in April 1945 the blood count revealed hemoglobin 14 5 Gm red blood cells 4,500 000 white blood cells 5 700 Platelets were abundant The differential count was normal She was able to lead an active life and felt perfectly well In June 1945 she had one of a series of cold waves' and noticed a pustular eruption around the roots of the hair, which disappeared after a few weeks, and which she did not connect with the hair treatment at the time. In January 1946 she began to go downhill for no apparent cause Her irritability and weakness returned Blood count revealed hemoglobin 10 6 Gm red blood cells 3 600 000 white blood cells 4 400 Platelets were scanty and the differential count showed low granulocytes and anisocytosis The condition did not respond to liver therapy as it had on previous occasions The laboratory investigations were repeated with the comparative results given in table 3

The ratio of esters to free cholesterol and the positive cephalin flocculation test suggested a chemical poison, and the patient was closely questioned as to possible causes It transpired that she had had a 'cold wave which she thought was her fifth, just before her relapse She has never had any allergic skin manifestations with the possible exception of the slight rash but her physical symptoms recurred and her blood picture was seriously affected with no improvement up to the present time

As has been shown thioglycolic acid can cause severe allergic reactions in sensitive persons Like other allergens its main impact is on the skin and mucous membranes The effect is cumulative, and sufferers have remissions after contact with the acid has been removed. The process has been applied to many thousands without ill effects but it seems probable that repeated exposures may eventually prove disastrous to those who have been immune up to the present time It is not possible to determine in advance without a patch test, which individuals will suffer toxic reactions In general those with anemias and allergic disturbances were the most vulnerable There is some evidence of group sensitivity having been developed in persons who had a violent response to the first application of thioglycolic acid by previous use of certain depilatories containing an HS radical

In the majority of cases recovery occurs without permanent damage to the liver when the exposure is promptly terminated. In those in which the acid acts as a systemic poison as well as an allergen the first signs of trouble are to be found in the blood count the elevation of the alkaline phosphatase the change in the ratio of free to esterified cholesterol and the appearance of a positive cephalin flocculation test.

Now that this product is being sold in the chain stores, its indiscriminate use will result in an increased incidence of poisonings, many of which are already finding their way to the courts Adequate labeling and understanding of the dangers involved are imperative

620 West 168th Street New York 32

## GAMMA GLOBULIN NOT EFFECTIVE IN PROPHYLAXIS OF EPIDEMIC RESPIRATORY INFECTIONS

HERMAN YANNET M D and JOYCE V DEUTSCH M D
Southbury Conn

During the course of an experiment on the prophylactic value of gamma globulin against infectious hepatitis, an unexpected opportunity occurred to test its value in an outbreak of an influenza-like respiratory infection The explosive nature of the outbreak and the uniformity of clinical and laboratory findings suggested a single etiologic factor presumably a virus, since extensive search for a bacterial agent was unsuccessful Eight samples of serum taken from as many patients about two to three weeks after the acute illness were sent to Dr Charles A Janeway who consented to have them analyzed for influenza A and B antibodies No significant titer of antibodies was found The etiologic factor, unfortunately, is therefore not known

Between Dec 16 and Dec 20, 1945 approximately one third of the inmates (aged 5 to 66 years) of each of twenty-five cottages were injected with gamma globulin The dose varied from approximately 4 cc to 10 cc depending on the body weight There were no significant reactions in the 400 patients injected

Between December 27 when the first case was noted and Jan 10 1946, when the last case occurred a total of 87 cases of an influenza like respiratory infection were seen The illness was characterized by relatively sudden onset of fever (100 to 104 F) mild sore throat, headache malaise vomiting nonproductive cough and signs of mild rhinopharyngitis X-rays of the chest in the more severe cases were indeterminate The white blood cells were either normal or reduced in number ranging from 4 000 to 9 000 the disease when present being primarily in the polymorphonuclear cells Not infrequently large mononuclear cells indistinguishable from those seen frequently in infectious mononucleosis and infectious hepatitis, were encountered The course of the disease was benign with normal temperature by the second or third day and disappearance of signs and symptoms at this time Complete recovery took place in every case without any complications Neither sulfadiazine nor penicillin was used the treatment being symptomatic Of the 87 cases 25 (29 per cent) occurred in the group injected with the gamma globulin Since the injected group represented approximately 33 per cent of the entire population there was no evidence of any protective action of the gamma globulin in this outbreak

During this period there were no cases of infectious hepatitis recorded.

### COMMENT

While the prophylactic use of gamma globulin for influenza like infections has not been reported as far as we are aware its use for other virus infections, such as measles and infectious hepatitis is well recognized That there proved to be no evidence of prophylactic value of gamma globulin for this type of respiratory infection is not surprising It is probable that only for those diseases which confer a permanent immunity will there exist the likelihood of finding protective antibodies in a reasonable concentration in randomly drawn plasma samples Presumably for most of the group of respiratory diseases of unknown viral etiology permanent immunity does not ensue

From the Department of Pediatrics Yale University Medical School New Haven Conn and the Southbury Training School Southbury Conn Major P Havens and Dr D M Horstmann were in charge of the Infectious Hepatitis Study at the Training School.

## SKIN BLISTERS CAUSED BY VESICANT BEETLES

MAJOR WILLIAM B SWARTS
Medical Corps Army of the United States
and
LIEUTENANT JOHN F WANAMAKER
Sanitary Corps Army of the United States

At the beginning of a dermatologic army service in Arkansas, one of us saw soldiers with huge bullae, usually on the legs and neck, which healed with mild antiseptics in about ten days These patients had been involved in activities which took place in fields and woods Previous experience in dermatologic practice in the northeastern part of the United States was of no help in diagnosis

After talking with natives and local physicians while he was stationed in Arkansas, the senior author learned the fact that the skin injuries produced by contact with "blister bugs" was common lay knowledge. The insects were even recognized by many of the outside workers

Chalmers and King [1] described an "epidemic" of blisters caused by vesicant beetles in Khartoum, Egyptian Sudan. Mainly members of the local English colony were affected, who were accustomed to eat in their gardens The authors observed that as long as the insect merely walks over the skin and is not irritated, it does no harm If, however, it crawls down the neck, arms and legs the beetle is annoyed by clothes and exudes a fluid from any part of its body It is their belief that this is a protective mechanism The scattered distribution of the blisters produced is explained by the movements of the insects

The apparent immunity of the Egyptians and natives of Sudan is explained because of their lack of clothes Roberts and Tonking [2] made similar observations on East African natives

Chalmers and King [1] observed that there were no symptoms for twelve to twenty-four hours and as a rule the patient does not remember the insect crawling on him and may be entirely at a loss to account for the blisters. The physician is handicapped in not thinking about this possibility Only 1 of our 3 patients remembered an insect being in contact with his skin.

Comstock [3] describes blister beetles, family Meloidae (Cantharidae) (order Coleoptera) as "of medium or large size. The

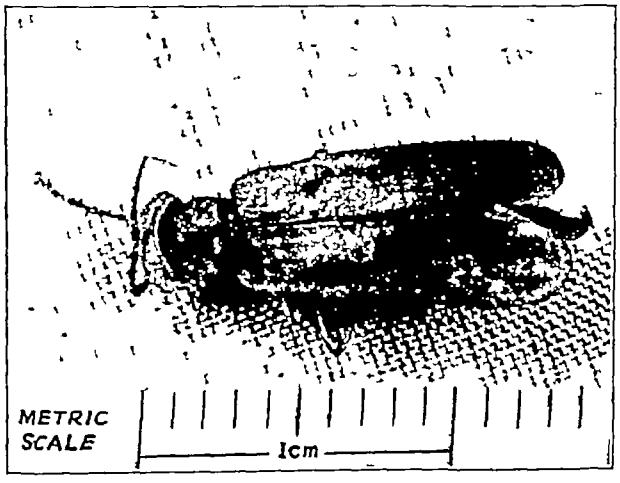

Fig 1—Blister beetle (Epicauta cinerea)

body is comparatively soft the head is broad vertical and sharply narrowed into a neck, the prothorax is narrower than the wing covers, which are soft and flexible, the legs are long and slender, the hind tarsi are four-jointed, and the fore and middle tarsi are five-jointed." Herms [4] further states that they are so named because of their vesicating properties i e., the application of the pulverized bodies or even the simple contact of many species produces a blistering of the skin.

Blister beetles deposit their eggs on the ground. The larvae are active and feed, it is said, in some species, on the eggs

Fig 2 (case 1)—Bullous lesion on nape of neck twenty four hours after contact with blister beetle

of locusts and solitary bees, others are predaceous. They undergo a series of changes not usual to insects, their development being termed hypermetamorphosis, i e, several types of larvae develop before reaching the adult stage. The adults feed on vegetation

More than two hundred species of blister beetles have been found in the United States, the greatest number being confined to the western half of the country One of the common species in the East, the genus Epicauta, colored a glossy deep purple, feeds principally on potato leaves and goldenrod pollen, while the larvae are believed to be parasitic on the eggs of locusts Another common species is of the genus Macrabasis. This beetle measures from 8 to 15 mm. in length, it is black but rather densely clothed with grayish hairs, which give an ashen hue to the upper surface. The Pennsylvania blister beetle, Epicauta pennsylvanica, also is a common species in the East

The Spanish fly, Lytta vesicatorea, is a southern European species of beetle found abundantly, particularly in Spain, during the early summer The collection and preparation of the beetles for medical purposes provide an occupation for many persons for a brief period Collecting and preparing these insects to produce cantharidin requires precautions because of their vesicating properties

It is planned to conduct experiments using both the blister beetle and patch tests with contents of the blister beetle bulla in an endeavor to reproduce the characteristic lesions Unfortunately, neither insects nor patients are available after the onset of cooler weather It will be necessary to postpone these experiments until summer

From the Dermatology Section Medical Service Regional Hospital Camp Joseph T Robinson, Arkansas

4 Herms W B Medical Entomology ed 3 New York Macmillan Company 1938 pp. 510-511.

Differential diagnosis includes the skin eruptions ordinarily characterized by bullae, i e pemphigus, dermatitis herpetiformis, erythema multiforme bullosum, dermatitis venenata and bullae produced by thermal and chemical agents

Pemphigus, dermatitis herpetiformis and erythema multiforme bullosum are readily differentiated since the bullae produced by contact with blister beetles usually are healed in approximately ten days while the three bullous diseases mentioned usually have recurrent crops of lesions in various stages of development. The bullae produced by vesicant beetles tend to be at the same stage of development about a day after contact with the insect Another characteristic of these bullae differentiating them from bullous erythema multiforme, is the lack of erythema around the fully developed bullous lesion.

These blister bug bullae can be distinguished from bullous lesions caused by vesicant agents by lack of history of exposure and also by the reaction time of mustard gas and lewisite being respectively two to eight hours and fifteen to thirty minutes Also the configuration of the blister bug bulla is distinctive, being almost perfectly round and symmetrically dome shaped except when lesions coalesce

A bulla indistinguishable from that of the beetle bulla can be produced by the application of a round piece of solid carbon dioxide with sufficient time and pressure to give the desired reaction The configuration of the blister, clear straw-colored blister fluid and lack of an erythematous halo are exactly imitated

REPORT OF CASES

CASE 1.—A man aged 21, seen in the dermatologic clinic May 31, 1945 felt an insect crawling on the nape of his neck while in the fields on the previous day Physical examination revealed a dumbbell shaped bullous lesion as in figure 2 The lesion was filled with clear, straw colored fluid and lacked erythema Complete healing took place in ten days.

CASE 2.—A man aged 35, admitted to the dermatologic ward Aug 3, 1945 complained of large blisters on the lower aspect of the legs, which appeared two days after his organization had camped in a field. He noticed red areas on the lower part of his legs which became large blisters in a few hours Physical examination revealed numerous scattered dome shaped nonerythematous bullae, containing clear, straw colored fluid and

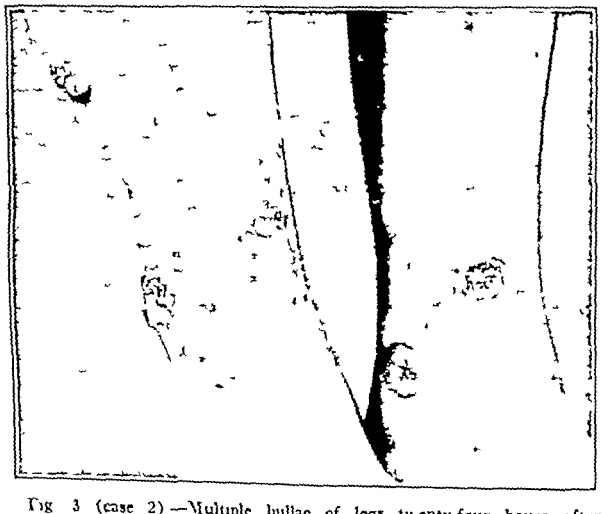

Fig 3 (case 2).—Multiple bullae of legs twenty four hours after exposure to vesicant beetles

varying in size from 1.5 to 5 cm Treatment consisted in removing the roofs of the bullae and applying antiseptics to the raw base Normal epithelium covered the areas in twenty days, and there was no scarring

CASE 3.—A man aged 28 came to the hospital Aug 11, 1945 complaining of blisters on his legs and ankles which had been present for five days One day before the appearance of these blisters he had been inspecting some field military installations Physical examination gave essentially the same results as cited in the 2 previous cases Trimming away the roof of the bullae and applying mild antiseptics to raw areas resulted in completed healing with no scarring in ten days.

The past history revealed that in the previous summer a similar attack was experienced while in the field A diagnosis of 'poison ivy" was made at that time

Fig 4 (case 3).—Blister beetle bullae, duration five days.

COMMENT

Characteristic bullae are produced by contact with blister beetles The possibility of this form of eruption should be kept in mind when one is confronted with a case presenting large bullae usually of the neck or the lower part of the legs and ankles, and occasionally on other exposed areas Characteristically these bullae lack any erythema and are at the same stage of development The cases are more numerous in the southwestern area of the United States and when warm weather prevails The history of exposure to the vesicant beetle is rarely obtained

---

**Everard Home and the Destruction of the John Hunter Manuscripts.**—The name of Sir Everard Home has passed down through the pages of medical history as a byword for apostasy for ingratitude for infidelity to himself, to his family and to science. Virtually every historian or biographer who mentions John Hunter takes pains to emphasize the undeniable fact that the greater part of Hunter's written contributions have been lost to posterity through the folly of his brother-in-law Sir Everard Home, who as his acting executor came into possession of Hunter's manuscripts at his death and who burned them thirty years later Almost without exception, historians have repeated the accusation of William Clift, Hunter's amanuensis, that Home had plagiarized the materials he held in trust and destroyed the papers to cover his own defection, and the basic assumption is commonly accepted that Home's action was deliberate malfeasance.—Oppenheimer Jane M New Aspects of John and William Hunter New York, Henry Schuman 1946

# Council on Industrial Health

## INDUSTRIAL HEALTH CONGRESS

The seventh Annual Congress on Industrial Health will be held in Boston at the Copley-Plaza Hotel September 30 through October 3 under the sponsorship of the Council on Industrial Health of the American Medical Association

The program as in the past will include speakers of national note and is expected to attract hundreds of medical men, nurses, hygienists and in addition legislators industrialists and others interested in the field of health in industry

At a later date further announcements relative to the exact program will be made in THE JOURNAL Because of the importance of the meeting those expecting to attend are urged to make their hotel and transportation plans as early as possible

# Council on Pharmacy and Chemistry

## REPORT OF THE COUNCIL

*The following statement concerning the establishment of the Therapeutic Trials Committee a standing committee of the Council has been adopted by the Council for publication Reprints of this statement which includes forms for submission of proposals for investigation and proposed standard form contract, are available* AUSTIN F SMITH M D Secretary

## THE THERAPEUTIC TRIALS COMMITTEE

Early in 1944 Dr J F Moore proposed to the Division of Medical Sciences of the National Research Council that there be established under its auspices a committee to sponsor and coordinate clinical research on new therapeutic agents He suggested that this committee receive funds from pharmaceutical houses having products deemed worthy of clinical investigation and disburse these funds under contract to competent investigators for the purpose of securing in the shortest time adequate and critical investigation of the therapeutic properties and safety of the new agent After consideration the National Research Council expressed the opinion that the formation and sponsorship of such a committee were not within the scope of its organization, and the proposal of Dr Moore was referred by Dr Lewis H Weed chairman of the Division of Medical Sciences to the American Medical Association for further consideration.

After thorough discussion by the Council on Pharmacy and Chemistry and by the Board of Trustees of the American Medical Association, a committee was appointed to draft a detailed proposal for the establishment of a Therapeutic Trials Committee With the termination of the war it has been possible to proceed with this plan and there follows a statement of the purpose organization and procedure of the Committee

*Purpose*—The Committee has been formed to encourage and aid sound research on medicinal agents and to promote therapeutics through an adequate understanding of the usefulness and limitations of drug products In particular the Committee (on its own decision) will organize impartial clinical trials of biologic and pharmaceutic agents which offer promise in the prevention treatment or diagnosis of disease

The fundamental objective of the Committee is to stimulate progress in the control and treatment of disease through facilitating investigations to establish the usefulness and limitations of diagnostic preventive and therapeutic agents The critical clinical appraisal of such agents and the dissemination of information about them will be accomplished by the voluntary cooperative effort of pharmaceutical manufacturers laboratory investigators clinical investigators and the medical profession

*Organization*—The Therapeutic Trials Committee is a standing committee of the Council on Pharmacy and Chemistry of the American Medical Association The chairman and members are appointed by the Council but they are not necessarily limited to members of the Council

There has been appointed a full time secretary of the Committee under the direction of the Secretary of the Council. Other assistants and special consultants will be appointed as needed The members of the Committee are as follows Members of the Council on Pharmacy and Chemistry are designated by an asterisk

David P Barr M D LL D (1947) New York professor of medicine Cornell University Medical College
Windsor C. Cutting M D (1947) San Francisco professor of therapeutics Stanford University School of Medicine
*E. M K Geiling Ph D M D (1949) Chicago professor of pharmacology University of Chicago
Keith S Grimson M D (1948) Durham N C assistant professor of surgery Duke University School of Medicine
*Robert P Herwick Ph.D M D (1948) Washington D C medical director Food and Drug Administration Federal Security Administration
*Chester Scott Keefer M D (1948) Boston Wade professor of medicine Boston University School of Medicine
*Perrin H Long M D (1947) Baltimore professor of preventive medicine Johns Hopkins University School of Medicine
Joseph Earle Moore M D (1949) Baltimore associate professor of medicine Johns Hopkins University School of Medicine adjunct professor of public health administration Johns Hopkins School of Hygiene and Public Health
*Stuart Mudd M D (1949) Philadelphia chairman of the Committee professor of bacteriology University of Pennsylvania School of Medicine
*W W Palmer M D (1947) New York Bard professor of medicine Columbia University College of Physicians and Surgeons
Ralph M Waters M D (1949) Madison Wis professor of anesthesiology University of Wisconsin Medical School
*W Barry Wood Jr M D (1948) St Louis professor of medicine Washington University School of Medicine

and ex officio

*Morris Fishbein M D Chicago Editor of THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION
*Austin Smith M D Chicago Secretary of the Council on Pharmacy and Chemistry
*Torald Sollmann M D D Sc Cleveland Chairman of the Council on Pharmacy and Chemistry
Walton Van Winkle Jr M D Chicago Secretary of the Committee

*Procedure*—1 The Committee will initiate or receive from outside sources suggestions regarding problems which offer promise of better means for preventing or curing disease or regarding particular products which are offered for the diagnosis prevention or treatment of disease

Requests for the investigation of theories methods and means for controlling disease may be addressed to the Committee Forms for the purpose of submitting requests to the Committee for clinical trials may be obtained from the Secretary If the Committee deems a project desirable and feasible steps will be taken to interest sponsors and investigators in conducting a cooperative project under Committee sponsorship

2 The Committee will seek and receive and analyze information and suggestions with reference to university departments hospitals research institutes and other suitable agencies for conducting clinical trials with special reference to their fields of particular interest and competence The Committee will welcome information concerning available investigators

3 The Committee will provide a medium whereby investigators interested in particular therapeutic problems may coordinate their efforts and seek advice from others working in the same field

On its own initiative or at the request of one or more investigators the Committee may arrange at a suitable time and place a conference on a therapeutic problem of interest The purpose of conferences will be to provide a mechanism for the prompt exchange of information on problems in which investigation is proceeding rapidly and simultaneously in a number of different centers By such conferences, investigators may compare ideas and coordinate their efforts, thus preventing waste of time and duplication of effort In addition the Committee may arrange for a rapid interchange of information on therapeutic investigations through a central clearing house. It will assist clinical investigators in securing competent advice on the conduct of their investigations

4 When the Committee is convinced that a product or problem merits investigation and knows of a competent

agency potentially interested in the investigation, steps shall be taken toward bringing the two together

If more than one sponsor may be interested in a product, efforts will be made to secure their cooperation by inviting them to participate in the project

5 Before a product shall be subjected to clinical trial, information must be available as to its nature, standardization, pharmacologic actions and toxic effects

Items on which information should be furnished to the Committee are the following

(*a*) Full data concerning the composition of the agent
(*b*) Physical and chemical properties including methods of assay, particularly those applicable to in vivo studies
(*c*) Pharmacology (actions toxicity and fate)
(*d*) Results of any preliminary clinical studies
(*e*) Conditions for which the drug is believed to be of value
(*f*) Proposed dosage and method of administration
(*g*) Any other relevant information

6 The Committee shall be under no obligation to initiate or participate in any investigation unless the Committee deems such investigation promising and feasible

7 The Therapeutic Trials Committee may serve as an agency whereby the sponsors of a problem or product are brought in contact with suitable hospitals or testing agencies so that an independent contract may be concluded in each instance between the sponsors and the agencies conducting the clinical trials The Committee will subscribe to such contracts provided it is satisfied that the plan of investigation, financial arrangements, means of reporting and other factors are such as will insure an adequate and unbiased clinical trial On request suggestions regarding the technic of the proposed trial will be offered.

Prospective investigators will be requested to submit to the Committee as part of a proposed contract, their general views on the following

(*a*) A proposed plan of investigation
(*b*) An estimate of the cost of the investigation
(*c*) An estimate of the time required to complete the investigation
(*d*) An estimate of supplies or special equipment which they would wish to be supplied by the applicant
(*e*) A statement of the direct contacts they wish to have with the sponsor
(*f*) A statement as to the frequency with which they wish to make progress reports to the Committee.

It is understood that these statements are only tentative.

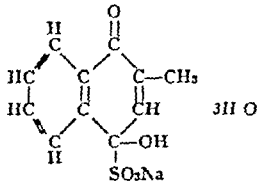
The Committee will not undertake to direct the method by which an investigator shall pursue a problem If a proposed plan of investigation appears unsatisfactory to the Committee, the investigator will be given the opportunity to modify his plan If he does not care to do so the problem may be offered to other investigators The Committee will if requested by the investigator offer advice regarding the proposed plan of investigation but it desires to assure at all times the freedom of the investigator

8 If the contract so provides the investigator may avail himself of the cooperation of the sponsors in supplying technical information related to the investigation

9 Reports shall not be offered for publication until reviewed by the Committee Investigators are free to publish their results in any manner they see fit However no mention of the Therapeutic Trials Committee may be made in any publication unless the report has been specifically authorized by the Committee

If after consultation between the Committee and the investigator publication appears desirable the investigator will be authorized to publish the results under his own name in a suitable professional periodical as a report to the Council on Pharmacy and Chemistry Before the report is published, the sponsor will be informed confidentially, of the results

10 The mutual obligations shall be considered as completed with the termination of the individual contract and further investigation with the cooperation of the Committee must be subject to further contracts



## NEW AND NONOFFICIAL REMEDIES

*The following additional articles have been accepted as conforming to the rules of the Council on Pharmacy and Chemistry of the American Medical Association for admission to New and Nonofficial Remedies A copy of the rules on which the Council bases its action will be sent on application*

AUSTIN SMITH, M D, *Secretary*

**MENADIONE SODIUM BISULFITE** — Menadione Bisulfite.— Contains not less than 49 per cent of menadione ($C_{11}H_8O_2$)"—U S P—M W 330.29 Menadione Sodium Bisulfite has the following structural formula

It may be prepared by the interaction of menadione and sodium bisulfite to form the addition product

For description and standards see the U S Pharmacopeia XII, First Bound Supplement, under Menadione Sodium Bisulfite and Menadione Sodium Bisulfite Injection

*Actions and Uses*—Menadione Bisulfite is used for essentially the same conditions as is menadione, which possesses the physiologic properties of vitamin K. *Unlike menadione* it is soluble in water, and stable aqueous solutions may be prepared

*Dosage*—It may be administered subcutaneously, intramuscularly or intravenously, the average daily dose being 0.5 to 2 mg During administration of the drug the prothrombin level of the blood should be followed especially when there appears to be need of an additional dose during a twenty-four hour period.

THE WM S MERRELL CO, CINCINNATI

**Tablets Menadione Bisulfite** 3 84 mg

**Solution Menadione Bisulfite** 3 84 mg **per cc.** 1 cc. ampuls Each cubic centimeter contains the equivalent of 2 mg of menadione, stabilized with 0 05 per cent sodium bisulfite.

U S Patent number 2 331 808

**CITRATED NORMAL HUMAN PLASMA** (See New and Nonofficial Remedies 1945 p 535)

The following additional dosage form has been accepted

SAMUEL DEUTSCH SERUM CENTER, MICHAEL REESE HOSPITAL, CHICAGO

**Normal Human Plasma (Citrated)** 60 cc. bottles Phenyl mercuric borate 1 15,000 is used as a preservative contains dextrose in final concentration of 5 per cent.

**PROCAINE HYDROCHLORIDE** (See New and Nonofficial Remedies 1945 p 97)

The following dosage form has been accepted

BARRY BIOLOGICAL LABORATORY, DIVISION OF BARRY ALLERGY LABORATORIES, INC, DETROIT

**Solution Procaine Hydrochloride 2%** 30 cc. bottles Each cubic centimeter contains procaine hydrochloride 20 mg, sodium chloride 4 4 mg sodium bisulfite 1 0 mg and 0 5 per cent chlorobutanol

**ESTROGENIC SUBSTANCES** (See New and Nonofficial Remedies 1945 p 440)

The following additional dosage form has been accepted

AYERST MCKENNA & HARRISON, NEW YORK

**Premarin *(Liquid)*** 120 cc. bottles Each 4 cc. contains 0 625 mg of estrogenic substances (water soluble) and 12 5 per cent alcohol

**PENICILLIN** (See New and Nonofficial Remedies 1945, p 214)

The following additional dosage forms have been accepted

THE WM S MERRELL CO, CINCINNATI

**Penicillin Sodium** 200 000 units

E R SQUIBB & SONS, NEW YORK

**Penicillin Sodium** 200 000 and 500,000 Oxford unit vials

## THE POOLING OF HEALTH AGENCIES

Late in 1945 a report was issued by the National Health Council recommending complete reorganization of the nation s 20 000 voluntary health agencies under a 'strong central agency' and the pooling of their fund raising appeals. The report, commonly called the Gunn-Platt report, was prepared by Selskar M. Gunn, C P H and Philip S Platt Ph.D under a grant from the Rockefeller Foundation. Apparently $100 000 was spent on this study which required three years The conclusions urged among other things the establishment of an effective health council in every community representing a voluntary affiliation of all local health organizations The report deplored the lack of central direction and planning and duplication of effort, it urged that present separate money-raising appeals be coordinated into a nation-wide campaign and asked that the two agencies with the most effective money-raising devices—the tuberculosis and infantile paralysis groups —broaden their fields of interest and service. The statement was acclaimed by many of the smaller philanthropic organizations and received the encomiums of many full time public health officials welfare workers and representatives of socialistically minded organizations These alinements in behalf of the objectives of the Gunn-Platt report might well have indicated to the medical profession the position that it should take with regard to the major recommendations of this document

In this issue of The Journal Dr Donald B Armstrong, using as a text the quotation from Dostoyevsky *'In the end they will lay their freedom at our feet and say to us 'Make us your slaves but feed us,"* calls attention to some of the dangers inherent in the Gunn-Platt proposals Dr Armstrong is convinced that the wish for a merger of philanthropic agencies such as is proposed, is based on erroneous concepts and is potentially destructive of all volunteer health agencies Unfortunately the American love for system efficiency, mass action and bigness has misled many persons who studied the Gunn-Platt report too casually into the belief that a superorganization of voluntary health agencies with a single national collection and a board for allocating the distribution of funds would result in improved effectiveness and extraordinary economy Dr Armstrong calls attention to the assumption in the report that communization of efforts and resources in our country is inevitable and that seemingly the world wide trends toward socialization must be followed here The report argues fallaciously that socialization in medicine and public health is inevitably coming on a national scale as regards official activities and that therefore parallel development is essential in the voluntary field Moreover Dr Armstrong indicates that 'a clever radical lay leadership in the American Public Health Association, for instance has unfortunately succeeded in putting this association on record as supporting the national socialization of medical care even though most of its members are naturally individualistic medical men"

Particularly important are the constructive suggestions made by Dr Armstrong for the maintenance of voluntary effort and private initiative in the field of voluntary health agencies 'Any soundly American organization, he says, "will want to maintain the independence nationally of the major voluntary movements but will at the same time wish to encourage a cooperative federation or conference procedure encompassing all the important national health and medical agencies" Certainly cooperation without destruction of individuality is the American way

## EFFECTS OF ATOMIC BOMB EXPLOSIONS AT HIROSHIMA AND NAGASAKI

A distinctive feature of the atomic bomb according to Captain Shields Warren and his co-workers,[1] is the large amount of radiant energy that it produces The chief biologic effects include the results of heat, producing thermal injuries of the flash-burn type, and results of exposure to x-rays This radiant energy was produced in an instant Combined with and modifying and obscuring the thermal and radiation injuries are the more usual effects of the conventional types of bombs Air-blast injury was usually of the secondary type due to flying debris or impact against fixed structures producing fractures and ruptures of viscera. The thermal effects were striking in their intensity considering the brevity of the period during which they occurred Clothes, wisps of hair and even an arm gave protection to the part of the body it shadowed The intensity of the heat and the instantaneous character of the flash are well brought out by photographs which show the profile of blades of grass in relief against the burned background of a board bunker The instantaneous and intense radiant heat burned the wood before the grass had time to wither or wave

1 Warren Shields and others Notes on Observations and Studies Made on the Effects of Atomic Bomb Explosions at Hiroshima and Nagasaki Bumed News Letter 7 No 9 April 26 1946.

The characteristic clinical course manifested by persons who suffered from radiation injury as a result of the atomic bomb explosions included weakness, anorexia, fever and often death and appeared usually within forty-eight hours These effects would parallel experimentally induced changes in animals and represent the syndrome of radiation sickness carried to an extreme degree The delayed effects represented injury of the irradiation sickness type These patients presented, in addition to weakness, anorexia and weight loss, and diarrhea

Warren's group studied 800 cases hospitalized and about 13,000 made available for casualty survey In the cities and villages around Nagasaki and Hiroshima the victims of radiant energy were easily apparent by the characteristic flash-burns and by the frequent occurrence of epilation There were three chief groups of symptom complexes resulting from damage to hemopoietic tissue The first was the leukopenic group in which infection, particularly a Ludwig's type of angina, was the chief characteristic The great bulk of leukopenic deaths occurred during the first three weeks after the bombing The leukocytes in the circulating blood were destroyed at the same time at which the hemopoietic tissue was damaged so that white blood cell counts as low as 200 per cubic millimeter were found in the first few days The second was the thrombocytopenic group From three to five weeks after the bombing a considerable number of hemorrhagic deaths occurred as a result of the thrombocytopenia caused by radiation damage to the megakaryocytes of the bone marrow Some persons had massive hemorrhages from various body orifices At necropsy hemorrhages filling the pelvis of the kidney, multiple mucosal hemorrhages of the stomach and multiple diffuse hemorrhages in the meninges or even in cerebral substance were frequently seen The third was the anemic group Those with serious damage to the bone marrow who weathered the first few weeks showed later manifestations of anemia with red blood cell counts in some instances dropping to a million or below Some bone marrows, as shown by sternal biopsy, were extremely hyperplastic, while others were aplastic The gonadal effect was much more prominent in the testis than in the ovary Spermatogenesis was suppressed, and frequently the tubules were represented only by Sertoli cells and thickened membranes The interstitial cells appeared to be undamaged The question of injury from residual radioactivity was of major importance Persons who had entered the bombed area soon after the explosion and had remained there were without deleterious effects

The treatment given by the Japanese was inadequate, as were their hospital facilities Blood transfusions were not used Little more than supportive treatment was given Repeated blood transfusions and penicillin to control infection during the leukopenic period should have materially reduced the number of deaths

## CERTIFICATION OF SPECIALISTS IN ALLERGY

Announcement was recently made by the American College of Allergists that a division called "The American Society of Certified Allergists" had established an "American Board for the Certification of Allergists" This "board" announces certain requirements which must be fulfilled for certification in this field including provisions for a "founders group" to be admitted without examination Provision is made also for the admission of others in exceptional instances to certification without examination

The American College of Allergists which is sponsoring this new movement, should not be confused with the American Academy of Allergy, the two groups are quite unrelated The new proposal for certification is entirely independent of the well established procedures for certification by the recognized American boards in the various specialties The recognized boards are sponsored by the national societies in each specialty and the corresponding section of the American Medical Association They were organized after careful review of the advisability and need for the establishment of the boards They have been recognized and approved by the Council on Medical Education and Hospitals of the American Medical Association and also by the Advisory Board for Medical Specialties Certification by a regular board is indicated in the directory of the American Medical Association by an appropriate symbol Since this new proposal for certification in allergy has not been considered by the Council on Medical Education and Hospitals of the American Medical Association or the Advisory Board for Medical Specialties, recognition of its certification will not appear in the Directory of the American Medical Association or in the Advisory Board's Directory of Medical Specialists Neither has any provision been made for recognition of the new board in any of the official publications dealing with certification of specialists There is now in operation an adequate mechanism for the regular certification in allergy as a sub-specialty of the American Board of Internal Medicine as well as the American Board of Pediatrics

Any new group of specialists seeking recognition as a regular board should proceed through these accepted channels

1 The proposal should be presented to the Advisory Board for Medical Specialties and to the Council on Medical Education and Hospitals of the American Medical Association

2 Jointly these two bodies consider the proposal, including the need for a new board and the adequacy of the educational program and facilities for the proposed certification

3 Official approval of the new board by the American Medical Association follows on approval by the Council on Medical Education and Hospitals on recommendation of the Advisory Board for Medical Specialties

4 Official recognition of the board is indicated by listing the specialty in the "Essentials for Approved Examining Boards in Specialties," indicating certified specialists with an appropriate symbol in the Directory of the American Medical Association and in the Advisory Board's Directory of Medical Specialists,

and admission of the board to membership in the Advisory Board for Medical Specialties

5 *Institutions* seeking residency approval in the new field make application to the Council on Medical Education and Hospitals

6 The Council conducts an inspection of the institution and prepares a report which is submitted to the new American board

7 Approval of the educational institution occurs only by conjoint action of the Council and the American board involved

The phenomenal growth of certification in the specialties is a clear indication of the need for this protection of the public and the profession in the field of specialty practice The established procedures have operated unusually well and there is no indication that there is need for a departure from these procedures in allergy or in any other field It is particularly unfortunate that this new group has incorporated the terms "American Board" and Certification" in its title, since these terms have become identified with approved boards and their programs This terminology is certain to mislead young physicians who seek to become recognized as specialists in this field

## Current Comment

### WORLD DRUG NEEDS

In a recent article in the *Foreign Commerce Weekly* (May 11, p 3) T W Delahanty urges that thought be given to the great potential drug market in foreign countries Achievements during the war period seem to open the way for further salutary progress in supplying foreign demands for our medicinals—if we proceed with vigor and wisdom toward carefully planned goals" There is no doubt that American-made drugs gained new eminence during the past few years and there is no doubt that an enormous demand for drugs exists Whether this demand will be met by manufacturers in this country will depend largely on a thorough appreciation of the uniqueness of each area, its population and the habits of its people As has been pointed out Axis drugs are still considered standard remedies in many uninformed areas of the world despite military, lend-lease and cash shipments to the United Nations Furthermore, there is need for considerable education of the prescriber, dispenser and consumer if relatively unfamiliar drugs are to become commonly accepted items In 1945 our foreign drug sales were $116,000,000, almost double the expected volume When divided according to type of product, this sum consists of about 59 million dollars for prescription medicinals, 29 million for vitamins and almost 28 million for articles for self medication Thus, unquestioned opportunity awaits those interested in and equipped for servicing the world's health needs But, because of the competition that is certain to develop, every advantage which may now be possessed by this nation must be pressed and every opportunity judiciously developed

### THE THERAPEUTIC TRIALS COMMITTEE

The Council on Pharmacy and Chemistry has established the Therapeutic Trials Committee to aid in the cooperative evaluation of new measures of therapy On page 596 is a statement of the objectives, organization and procedure of the committee Even a casual reading will reveal the emphasis on the value of cooperation in modern research The benefits of coordinated research programs have been appreciated by a few scientific investigators for a long time, but apparently a catastrophe in the form of a global war was needed to make practical a plan The history of the formation of the Therapeutic Trials Committee seems to be a favorable omen for its success A formal proposal was made by a subcommittee of the National Research Council, the Board of Trustees of the American Medical Association and the Council on Pharmacy and Chemistry immediately responded to the proposal with the formation of the committee, and manufacturers and research workers in medical schools, hospital clinics and elsewhere enthusiastically asked for and promised participation Just where this new venture of the Council will lead is for the future to determine The activity is carefully planned all the way, as is characteristic of the Council Undoubtedly changes will occur as experience is gained, but progress is made only when action is taken Any step that contributes to the welfare of the population and to the medical armamentarium of the physician is real progress Research workers and manufacturers of articles of importance to public welfare should study carefully the plans of the committee Such study will certainly elicit enthusiastic support

### SYMPOSIUM ON MEDICINE AND LAW

Announcement has recently been made of the forthcoming second symposium series on Scientific Proof and Relations of Law and Medicine under the editorship of Hubert Winston Smith, M D , LL.B , professor of legal medicine, University of Illinois College of Law As was the case in the first series, in 1943, arrangements have been made for the publication of the papers comprising the second series, seventy in number, in approximately twenty-five medical and legal journals A master index has been prepared to enable those interested to know in what journals the individual papers are published, this index will include also citations to the journals in which the discussions of the 1943 series appeared[1] Papers comprising the present series are arranged in six groups, exclusive of certain prefatory items, as follows Legal and Scientific Aspects of Criminal Law and Criminology, Relations of Civil Law and Clinical Medicine, Scientific Crime Detection, Modes and Mechanisms of Scientific Proof, Medicolegal Problems of the Physician Arising in the Practice of Medicine, and Sociomedicolegal Problems This symposium is an ambitious and intelligent effort to clarify some of the problems in which medicine and law have common interests and to illustrate the breadth of the field in which such problems arise

1 Interested readers can obtain this index as long as the supply lasts for twenty cents from Dr Hubert Winston Smith Professor of Legal Medicine College of Law University of Illinois Urbana Illinois

## ARMY AND NAVY

### JOINT ACTION TO RELIEVE SHORTAGE OF MEDICAL AND DENTAL OFFICERS

The War and Navy departments have announced joint action taken to relieve a very serious shortage f medical and dental officers which now exists in the combined requirements of the Army, Navy and Veterans Administration

Regardless of date of entry on active duty, only a two year period of service will after July 1 be required of all Army Medical Corps officers, including graduates of the Army Specialized Training Program except critically needed specialists A two year period of service will be required of all Navy graduates of the Navy Medical V-12 Training Program who after March 1, 1946 were or will be ordered to active commissioned duty on completion of internship Navy doctors already separated will not be recalled Under the Army s new two year policy, it is estimated that approximately sixty days after July 1 will be required to complete the release of approximately 3,000 army doctors affected by the change

By this action the requirements both of the Army and of the Navy can be met and in addition the Army can make available to the Veterans Administration approximately 1,000 badly needed medical officers and the Navy about 500

In order to meet the minimum requirements of the Army and Navy for dentists, and to establish comparable discharge criteria for the two services, the War and Navy departments have agreed that all dental officers partially or wholly assisted in their education by the federal government in the A S T P and the V-12 program and now on active duty on completion of such education will for the time being be released on completion of three years of commissioned active duty service Navy dentists already separated will not be recalled to active duty The length of service required for army dentists now on duty other than A S T P graduates has been reduced from thirty nine to thirty-six months effective immediately

The Navy will shortly make available to the Army approximately 800 dental officers When this transfer is completed, the period of service required of all dental officers will be further reduced Before discharge requirements can be reduced to two years for both services the Army will require additional dental officers To meet this need Selective Service has been asked to procure 1 500 young dentists who are being accepted with the understanding that no more than two years of service will be required from them

Transfers of dental officers from the Army or Navy to the Veterans Administration will not be required.

It should be noted that extension of the period of service required for navy doctors and dentists applies only to those whose education was subsidized by the federal government in the V-12 program or the A S T P

## ARMY

### ARMY AWARDS AND COMMENDATIONS

#### Colonel Franklyn A Rice

The Legion of Merit was recently awarded to Col. Franklyn A Rice, Cleveland, for 'his superior performance of duty as chief of the surgical service, Billings General Hospital, from March 25, 1943 to Dec. 3, 1945" The citation stated that his outstanding ability as supervisor of the surgical service and as an operating surgeon has been a tremendous contribution to the success of Billings General Hospital His surgical judgment and his capacity for achievement have been an inspiration to all associated with him" Colonel Rice is now chief of surgical service at the Regional Hospital, Fort Knox, Kentucky He graduated from the University of Wooster Medical Department, Cleveland, in 1909 and entered the service Aug 11, 1942

#### Lieutenant Colonel Milton W Erdle

The Legion of Merit was recently awarded to Lieut Col Milton W Erdle, Frankfort Ind., for exceptionally meritorious service as an Army Air Forces post surgeon in the United Kingdom from Aug 11, 1943 to Dec. 8, 1944 In southern England, during intense V bomb attacks in 1944, Colonel Erdle devised special equipment and organized and trained special medical surgical teams which cared for American casualties of these bombings and also rendered assistance to British officials in caring for civilian casualties Dr Erdle graduated from Indiana University School of Medicine, Indianapolis, in 1936 and entered the service Jan 5, 1941

#### Lieutenant Colonel Jean S Felton

The Army Commendation Ribbon was recently awarded to Lieut. Col Jean S Felton, Knoxville Tenn, for commendable service in the port surgeon s division San Francisco Port of Embarkation from Jan 15 1944 to June 30 1945 ' The citation accompanying the award directed attention to the fact that 'his tireless energy initiative intelligent and practical insight into the industrial activities, as evidenced by his development and execution of the outstanding industrial medical program of the San Francisco Port of Embarkation, has reflected great credit, not only on himself and his organization, but also on the army as a whole." Dr Felton graduated from Stanford University College of Medicine, San Francisco, in 1935 and entered the service Dec 15, 1940

#### Lieutenant Colonel Jerry O Crist

Lieut. Col Jerry O Crist, formerly of Centerburg Ohio, and now at Wakeman General Hospital, Camp Atterbury, Indiana, was recently authorized to wear the Army Commendation Ribbon by direction of the Secretary of War The citation reads that he 'accomplished with notable distinction his assignments as commanding officer of Post Hospital, Camp Breckenridge, Kentucky, from Oct. 6, 1942 to June 18, 1944 Exhibiting outstanding initiative, judgment and attention to duty and professional skill, Lieutenant Colonel Crist has brought commendation to his profession and this command." Dr Crist graduated from Ohio State University College of Medicine, Columbus, in 1931 and entered the service Oct 15, 1940

#### Colonel Benjamin Simon

Col Benjamin Simon, Quincy Mass, was recently awarded the Legion of Merit for his work as chief of neuropsychiatry because he 'effectively organized and trained the personnel of this service from its activation. By his able supervision and direction a high degree of efficiency was achieved in the care and treatment of many thousands of neuropsychiatric patients" Dr Simon was also awarded the Army Commendation Ribbon. He graduated from Washington University School of Medicine, St Louis, in 1931 and entered the service April 19, 1942

#### Brigadier General William A Hagins

The Distinguished Service Medal was recently awarded to Brig Gen. William A. Hagins Eighth Service Command surgeon Dallas Texas for his work in providing "an efficient, smoothly functioning medical service during military operations in the Philippines and in overcoming 'the many threats to the health of both combat and service troops" General Hagins graduated from the University of Georgia School of Medicine, Augusta, in 1914 and entered the service in 1917

# ORGANIZATION SECTION

## National Health Program

### PLATFORM ADOPTED BY THE AMERICAN MEDICAL ASSOCIATION

*This is the last of the ten points in the platform The previous points have appeared in the last nine issues of The Journal*

10 Fundamental to the promotion of the public health and alleviation of illness are widespread education in the field of health and the widest possible dissemination of information regarding the prevention of disease and its treatment by authoritative agencies Health education should be considered a necessary function of all departments of public health, medical associations and school authorities

## Postwar Medical Service

### MINUTES OF MEETING OF MARCH 9

Chicago, Illinois

The meeting of the Committee on Postwar Medical Service was called to order by the Chairman, Dr Ernest E Irons, at 10 05 a m, March 9, 1946, in the Board of Trustees Room of the American Medical Association Building, Chicago Those present were

Dr Irvin Abell
Dr Frederick A Coller
Dr F S Crockett
Mr Graham L Davis
Capt. William E Eaton
Col Bryan C T Fenton
Dr Morris Fishbein
Dr E L Henderson
Mr Thomas A Hendricks
Dr Ernest E Irons
Dr Victor Johnson
Dr George F Lull
Col Hugo Mella
Dr J J Moore
Dr James E. Paullin
Dr Carl M Peterson
Lieut. Col William N Piper
Rev A M Schwitalla, S J
Dr R L Sensenich
Dr Austin E. Smith
Mr Barry C Smith

The Chairman introduced as a new liaison member of the Committee Dr F S Crockett, Chairman of the Committee on Rural Medical Service of the American Medical Association.

*Bureau of Information*—Dr George F Lull, Associate General Manager of the American Medical Association presented the following report on the activities of the Bureau of Information

The activities of the Bureau of Information have been accelerated in the past three months

A committee was formed at the February Conference of State Secretaries and Editors, with Dr R. B Anderson of Texas as chairman, to act in an advisory capacity to the Bureau of Information This was done to carry out the recommendation of the House of Delegates that " the American Medical Association should be urged to provide advice or service to state information services relating to methods of organization and procedure.

Directives already have been sent to each state medical association outlining a procedure in establishing committees to facilitate the collection of statistics at the local level The executive secretaries of the Ohio and Oklahoma state medical associations members of the advisory committee, are reviewing all forms and reports in order to simplify and correlate methods of reporting material from the states to the American Medical Association

An informal meeting was held with Dr V M Hoge of the Hospital Facilities Section of the U S Public Health Service to discuss methods of correlating the work of the Bureau of Information with hospital and health center planning at the local level.

In cooperation with the Committee on Rural Medical Service and the Council on Medical Service and Public Relations the Bureau of Information is working closely with the American Farm Bureau the Farm Foundation and other farm groups

Preparations are being made for an exhibit by the Bureau at the meeting of the American Medical Association at San Francisco in July Rural medical needs will be shown by means of a fluorescent colored pin map of the United States showing distribution of physicians and by various charts and graphs A pamphlet on 'Rural Medical Service" is being prepared for distribution at the exhibit booth.

These activities of the Bureau are in addition to its primary function of supplying information to returning medical officers relating to medical education, licensure and relocation.

*Surplus Property*—Father A M Schwitalla, Chairman of the Subcommittee on Surplus Medical Hospital and Dental Supplies, stated that there was relatively little to report at the present time. Authority over surplus located outside the United States has been transferred to the State Department, and this may affect the situation in the Philippines There has been considerable selling of surplus property to educational institutions Many institutions anxious to acquire surplus material have their own surplus property officials, and some have as many as eight or ten individuals besides clerical assistants in such an office.

Dr Fishbein thought that some arrangement might be worked out whereby state and national medical periodicals could receive informational material from the official bodies concerned with surplus property disposal that might be published regularly

Dr Lull informed the Committee that he had received an advance copy of a bulletin from the Office of the Surgeon General which offers the information that a list of surplus medical property is being prepared and that he hopes to receive the list. He further stated that any medical property over a one hundred and twenty day supply had been ordered turned over as surplus to the Office of the Surgeon General

*Postwar Rural Medical Service*—Dr F S Crockett, who the Chairman stated has been active in bringing together in conferences with representatives of the American Medical Association various organized rural groups, presented a statement regarding rural medical care

The farm people have as their voice certain organizations In the Northwest it is the Farmers Union. They have taken a position rather radically in favor of the Wagner Murray Dingell bill since they are representing the poorer group of farmers, those with annual incomes around five or six hundred dollars This is the only farm group with that particular leaning Of the others the National Grange not truly a farm group is the oldest organization of the country people strong in New England and in Washington and Oregon The National Council of Farm Cooperatives appears to take an individualistic view The National Cooperative Milk Producers Federation represents dairy people all over the Union with whom the Committee on Rural Medical Service has met. This group took a position of opposition to the Wagner Murray Dingell bill The Farm Foundation occupies a peculiar position. As a research organization it undertakes to tie in the activities of the other organizations and in this health matter has established a health committee representing all the organized farm groups. Our committee met at the Farm Foundation headquarters last September to explain the Fourteen Point Program of the American Medical Association and other matter In June 1945 the American Farm Bureau Federation and Associated Women, representing close to a million farm families through its health committee asked the American Medical Association to cooperate with it to find out what could be done in the matter of improving rural medical service. For a number of years the younger men have been going in less and less numbers to rural areas Several factors economic social and professional are involved. We bring up our young doctors trained in hospitals requiring internships and residencies and expect them to go out where none of the diagnostic or consulting facilities exist except remotely They are loath to go out there. The ones that do go most often do so with the idea of skimming the cream of the practice and in a few years go to a city The Associated Women of the American Farm Bureau Federation are spark plugging the attempt to improve rural service They are taking exactly the attitude that we take Their representative has appeared before Senate and House committees opposing and supporting the same things we oppose and support with no instigation from us.

A number of states in view of the coming need for information on rural and urban communities have conducted surveys Georgia has made a remarkably good analysis of the entire state situation Virginia more recently has done a similar job and one which perhaps equals that in Georgia Indiana has made a survey of hospital and health facilities but the report is not yet received the Medical Society of the State of New York made a county by county survey outside New York and Brooklyn covering diagnostic facilities and making recommendations regarding deficiencies. The whole problem is being studied and a tremendous amount of information is being obtained. Other states are working on the same thing

One of the big troubles in getting doctors to stay in rural communities is Here comes a good doctor to a small community of four or five hundred people not the county seat Farmers will call on him for many things but their attitude is illustrated by a doctor who came in one day to a medical meeting saying that farmers going to Lafayette to do their trading would step into his office and ask him what doctor they should see when they got to town The Associated Women of the American Farm Bureau Federation realize that situation They have said there must be a tremendous amount of educational work done among their own rural people

The plan of the Committee on Rural Medical Service fits in with the concept and activities of the Committee on Postwar Medical Service. Our committee spent all last year after meeting with the various farm groups organizing rural health committees in the state medical societies and by Jan 1 1946 nineteen states had reported committees and some six or seven had promised to do so Since then additional committees have been appointed The Farm Bureau has had much the same sort of lag It has tried to get its local bureaus to appoint committees to get together with medical society committees only about twelve states reported committees but pressure is being exerted The Hill Burton bill is coming along and will have much influence on the placing of doctors in smaller communities

The Committee on Rural Medical Service has received the permission of the Board of Trustees to enlarge itself so that it will have members who can be in charge of the committee s endeavors in the various areas For instance in the deep South Arkansas Louisiana Mississippi Alabama Florida and Georgia have been taken as one area and Dr John Paul Jones of Camden Ala has been made a member of the committee and will have the responsibility of getting the area going Dr H B Mulholland of Charlottesville Va has as his area Maryland Virginia West Virginia and probably Kentucky to do a comparable job Some one in the Southwest—Texas—will be appointed for that area Dr L W Larson Bismarck N D is responsible in the Northwest These men will have ideas of what is going on in their areas so that we shall have definite knowledge of the rural medical problems

One thing must be decided If we are to say we need a certain rural medical situation a plan to accomplish it must be devised Local cooperation and local tax support must be obtained. It is first the duty of communities to support these things and to seek state and federal aid only after local taxation has become inadequate Increased publicity is going to be needed for this The public we are going to work with is the farm population This year should be a year of action Unless something is accomplished people soon lose interest and desirable activity goes by the board

The Chairman called on Mr Barry C Smith to discuss the subject

This is an extremely difficult proposition It is perfectly natural for a well trained young physician to hesitate to go out where he won t have desirable and proper facilities The obvious answer is to see that facilities are placed there but simply building a hospital does not assure that it will be staffed either by physicians nurses technicians or anybody else It is going to take a long time and a great deal of patience to get a complete solution The experience of the Commonwealth Fund has not been very wide although it has been intensive in two or three states We tried the fellowship plan offering fellowships for the complete four years in medical school and two years internship to men who would agree to practice in country areas for a certain length of time. The men agreed but along toward the end of their fellowships began to get a little restive A few refunded their fellowships in order to get out of the agreement A few served their three years and then departed. The enterprise was so unsuccessful in general that we closed it out a few years ago No fellowships have been awarded since 1940

The Hill Burton bill probably will pass and if properly administered will be a good thing but it should not be anticipated that there is going to be a perfectly equipped hospital at every crossroads in the country in the near future. The problem is not going to be solved in any short period of years We ought to try to solve it but it is going to take quite a while If we accomplish in fifty years what the supporters of the Hill Burton bill think will be accomplished in five we shall be doing fine

In the experiment of the Commonwealth Fund in upper New York State the smaller hospitals are grouped around an urban center Rochester The area about Rochester is rural very prosperous by no means thinly populated So far the experiment is going very well In building hospitals we put them where they are needed not in a place where there are five or six people to the square mile

*Intern and Residency Opportunities for Veteran Medical Officers*—Dr Victor Johnson presented the following statement

At the last meeting of this committee I mentioned our proposal to establish a special category of approved residencies calling them temporarily approved residencies The need stems from the fact that we have been successful in stimulating hospitals to establish residencies and were considerably behind in our inspections Residencies are temporarily approved on the basis of a rather detailed written statement from the institution concerned. We have taken this question up in the meantime with the various specialty boards and virtually all of them now have agreed to collaborate in this program Each board with possibly one or two exceptions is designating one or two individuals to represent it the Council is designating the headquarters staff to represent it We shall confer with the representatives of the boards and if the information available seems to warrant approval the approval can be granted within a week or two instead of the usual months Specialty boards have agreed that credit will be allowed for work done in the temporarily approved institutions even though subsequent inspections might show that the institutions do not warrant permanent approval We shall be as careful as we can shall not admit all comers and shall get as much information as we can prior to inspection so that subsequent inspection will enable us to transfer this hospital from the temporary to the approved list We shall do all we can to guard the quality of the residency

The Chairman asked Dr Johnson how many surgical residencies are available, mentioning a communication received from a Cincinnati physician, chief of a surgical service at a general hospital in that city, who is much upset over the number of medical officers who want surgical residencies and cannot get them Dr Johnson said that the exact figure could not be obtained but that it was somewhere around 1,250 and that the bottleneck is in surgery because a large majority of the returning officers want surgical training

*Educational Program Under the G I Bill*—Dr Johnson made the following brief statement

We were a bit upset at the meeting of the Committee in January because it appeared that all the agreements we had reached with the Veterans Administration might go by the board we had agreed as to just what the procedure would be for hospitals and for residents seeking education under the G I bill Since then the Veterans Administration has come through and an item was published in THE JOURNAL January 26 Reprints were made and sent to hospitals to local veterans agencies in the various states and to state approval bodies urging them not to approve institutions unless they were of a high caliber our own lists of approved institutions were sent with the reprints The response from the state approval institutions and from the state veterans agencies was gratifying They said this is extremely useful information to us and we are going to follow your directions I think it has done a great deal of good in facilitating the participation of hospitals and residents under the G I bill

Father Schwitalla observed that there still is a bottleneck He said After the veteran sends in his application and gets his certificate there is a long delay which probably is in the local office Some wait for four or five weeks and perhaps longer and the important thing is that the man does not get his subsistence or the school its tuition which start on the day when the veteran finally gets his go sign The veteran loses a lot of money Some way ought to be devised whereby the subsistence payment could be made retroactive. Dr Johnson said that Father Schwitalla's observation is a reflection of what is to be found in all educational fields and he thought it might be well for the Committee on Postwar Medical Service to raise the question with the Veterans Administration of the desirability of making retroactive payments to applicants

The matter was left in the hands of the subcommittee with authority to act, and a report was requested for the next meeting

*Survey of Supply of Medical Students*—The Chairman brought to the attention of the Committee a letter addressed to Dr Frank H Lahey Chairman of the Directing Board of the Procurement and Assignment Service by the Director for Manpower of the Office of War Mobilization in which the plea of the Procurement and Assignment Service for the deferment of premedical and predental students was refused This letter was printed in THE JOURNAL February 23 page 499 without comment.

Dr Johnson said 'The number is not as much less than normal as was anticipated It was surprising that there was such a small reduction—in terms of the prewar numbers Probably what is happening is that the stronger institutions are draining off the cream and the weaker ones are taking all comers so that we may not be faced with a lack of quantity of students but with a lack of quality

*Veterans*—Father Schwitalla presented for the subcommittees of which he is chairman the following statement

There are many problems in connection with veterans affairs that are of interest to this committee. There is very little that is new but the developments raise certain questions Before very long the Committee should be much interested in getting a progress report from General Hawley on his success in locating general hospitals near medical schools because it is on that fact or that policy that the development of a medical corps in the Veterans Administration depends Consequently we should find out to what extent the Veterans Administration is getting cooperation from the faculties of medical schools

It would be desirable to have a statistical report on the number of medical students and residents under the G I bill and on how many of the hospitals and medical schools are collecting the $180 permitted without any further statement of cost. The feasibility of paragraph 3 of directive number 9 which estimates the cost to medical schools as $500 a year ought to be explored So far no contracts have been made by the Veterans

Administration with the medical schools We should try to find out why no contracts have been closed if that is true

Another thing emerging in this picture of vital interest to this committee is the care of the veteran in the hospitals private as well as public and veterans hospitals To what extent is the veteran going into the voluntary nongovernmental hospital?

Dr Fishbein informed the Committee that a report had been received from General Hawley which gives the number of physicians, nurses and other personnel that have accepted appointment since the enactment of Public Law 293 creating the new Department of Medicine and Surgery in the Veterans Administration and which further states that 797 new physicians have accepted appointment. (*This report was printed in* THE JOURNAL, March 16, p 710)

*Informational Reports*—Col. Bryan C T Fenton presented copies of a recently published army regulation dealing with professional graduate education for Medical Corps officers, saying that this is the first time it has been possible to get a regulation published on this subject that this is a distinct educational advance on the part of the Army, and that as long as there are A U S officers in active service it will apply to them as well as to members of the regular Medical Corps He said that Colonel Piper had asked him to inform the Committee that as of March 1 1946, 27 943 Medical Corps officers had been released, that the total remaining in the Medical, Dental and Nurse Corps are Medical Corps 20,178, Dental Corps 6 492, Nurse Corps 19 845, and that release is at a rate of about 1 000 a month

There was a discussion as to whether and when A S T P students would be called for active service Dr Lull said that students who have finished their nine months intern courses are going to be called, and Colonel Fenton stated that all A S T P s must serve. Dr Johnson said he had been told in Washington recently that no seniors or house officers would be released on points but from juniors down they would be Father Schwitalla thought that the hospitals or the men concerned should be given some option in the matter He said that some hospitals had taken the students on the basis of a sixteen months internship and now would lose them after only a twelve or nine months internship Colonel Fenton said he would send a memorandum regarding this matter which might be incorporated in the minutes The statement received from Colonel Fenton is as follows

Men who graduate from medical school subsequent to Jan 1 1946 will be deferred for twelve months internship at the completion of which they will be called to active duty

Interns who complete a nine months internship during the months of January, February and March 1946 will be called to active duty at the completion of the specific internship

Interns who complete nine months internship during the period of April 1 and June 30 1946 may be deferred on request until July 1, 1946

With reference to such deferments of this group the Procurement and Assignment Service issued a mimeographed information pamphlet form 386 dated Dec. 20 1945 which directed state chairmen Procurement and Assignment Service and hospital superintendents to submit the names of such interns who desire deferment until July 1 1946 These lists were to be submitted to the Federal Office Procurement and Assignment Service Washington D C not later than Feb 1 1946

*Junior and senior residents regardless of the proportion of their specific* residency completed on April 1 1946 are being called to active duty, effective April 1 1946

Capt William E. Eaton stated that all the men in the Navy V-12 program who are finishing their internship about the first of April will be called to active duty and that those who are just beginning their internships will continue on a twelve months basis and will be subject to call at the end of twelve months

Mr Graham L Davis reported that the American Hospital Association is beginning to raise some question about its being the sensible thing to build 200,000 additional hospital beds for veterans, under the program outlined in the Hill-Burton bill (S 191) it is expected that there will be an orderly development of hospital service in this country the veteran is a civilian and apparently should get his hospital service like other civilians, it is difficult to see how the building of 200 000 new beds, which apparently is being planned independently will fit into the national program It was thought by several members that this phase would be clarified within a few months when the plan of the Veterans Administration to set up its hospitals near and in connection with medical schools is more fully developed

# Washington Letter

*(From a Special Correspondent)*

June 10, 1946

## Einstein Supports World Control of Atom

Dr Albert Einstein was one of a group of leaders in science politics and military life who advocated international control of the atom bomb in the forum broadcast 'Operations Crossroad," originating from Washington Dr Einstein said that Americans must use their ability to reason and use it now or human society will disappear in a new and terrible dark age of man kind In accord with this view were Joseph E. Davies former ambassador to Russia Air Force Gen Harold C Kenney, atomic scientist Harold O Urey, Senator Brien T McMahon, Mrs Wendell L Willkie, Harold L Ickes, Representative Jerry Voorhis Harold E Stassen, Supreme Court Justice William O Douglas Secretary Wallace and Archibald MacLeish The atom bomb test scheduled for next month at Bikini Atoll in the Pacific was described by Dr Louis Ridenour, physicist of the Massachusetts Institute of Technology, as 'a gigantic boon doggle.'

## Navy Venereal Disease Rate Rises Since VJ Day

The Navy Bureau of Medicine reports that the venereal disease rate among navy men overseas and aboard ships has risen rapidly since VJ day The overall rate has more than doubled since the war ended, and among shipboard sailors the venereal disease rate has almost tripled Among those stationed overseas, the rate has multiplied five times The increase is traced to more generous shore leaves and overconfidence in quick cures An intensive educational campaign had cut the rate down to 28 per thousand men during the war, whereas in March the total was 77 3 per thousand men 66⅔ in the United States, 83 7 overseas and 92 7 aboard ship

## Closer Relationship Between Doctors and Dentists Recommended

Need of closer cooperation between the medical and dental professions was advocated by Dr J Ben Robinson, dean of the University of Maryland's Dental School, at the first annual convention since 1941 of the Five-State Postgraduate Clinic of Dentists held here Delegates were from Virginia, West Virginia, Maryland, Delaware and the District of Columbia Representative Rivers, Democrat of South Carolina, lauded the achievements of dental surgeons in the war and cautioned against dangers of the regimentation of medicine

## Research on Rheumatic Fever Launched by Navy

The U S Navy has started research by a unit at Dublin, Ga., to find a cure for rheumatic fever which is rated a more lethal childhood infection than infantile paralysis tuberculosis or pneumonia A two story hospital houses research activities in which youthful sailor patients receive treatment. The hospital was opened a year ago as a treatment center for rheumatic fever It is similar to the hospital established a year earlier at Corona Calif Aspirin and rest comprise the main treatment given the 1 200 patients, but 102 have been selected for special clinical investigation

## Death of Babies Aboard Ship Traced to Virus Disease

Representative Jackson, Democrat of Washington reports that the War Department has revealed the cause of the deaths of eight servicemen's babies brought to the United States on the brideship' *Zebulon B Vance* as a virus disease pneumoenteritis The disease has never occurred in human beings in this country before, it is reported An Army board of inquiry has absolved the medical staff of the ship of any negligence or misconduct regarding the deaths of the babies after arrival of the ship May 19 in New York from Le Havre.

## Mental Hospital Bills Introduced in Congress

Companion bills have been introduced in both House and Senate at the request of St. Elizabeths hospital authorities which would allow the voluntary internment of persons for mental care and treatment

### Fifteen Hundred Dentists to Be Drafted into Army

Major Gen Norman T Kirk Surgeon General of the Army, reveals that Selective Service Headquarters has been asked to draft 1,500 dentists for army duty to permit discharge of dental officers with long service. Recent graduates of approved dental schools will be sought primarily as inductees They will be offered commissions, and their term of service will be limited to two years

# Official Notes

## THE SAN FRANCISCO SESSION

### Hotel Reservations Should Be Canceled by Those Unable to Attend

The Hotel Committee for the San Francisco Session of the American Medical Association has assembled approximately 50 per cent more bedrooms this year than were used in the last session held in San Francisco, in June 1938 Nevertheless the demand for rooms exceeds the supply and probably 300 or 400 Fellows may not be able to find accommodations The members of the committee are doing everything possible to provide bedrooms for as many of those who wish to attend the session as possible Those who have been assigned rooms and find that they are not able to attend are requested to notify the hotel committee as promptly as possible so that their rooms can be released to others who have not been able to obtain them

## REGISTRATION UNDER THE HARRISON NARCOTIC ACT

Physicians, other than those in the armed services, who are registered under the Harrison Narcotic Act or under the Marihuana Tax Act must effect registration on or before July 1 to avoid a penalty Each year, despite the annual warnings in THE JOURNAL, this requirement is overlooked by some physicians and unpleasant consequences follow Failure to register adds a penalty of 25 per cent to the tax payable and in addition subjects the physician to the possibility of a fine not exceeding $2,000 or to imprisonment for not exceeding five years, or to both As an act of grace the Commissioner of Internal Revenue has in past years given some tardy registrants the choice between paying sums by way of compromise, a procedure authorized by law, or of accepting criminal prosecution. If this procedure does not produce the required promptness in reregistration, the commissioner will have no other alternative than to institute criminal prosecution.

# Medical Legislation

## STATE LEGISLATION

### Louisiana

*Bills Introduced*—H 272 proposes the enactment of a mental health act to provide for the discovery and treatment of mental disorders H 339 and S 66 propose the creation of a state board of chiropractic examiners and defines chiropractic as "a system of health based upon the use of such natural methods as the palpation and adjustment, by hand, of the segments of the spinal column and adjacent tissues, the use of light, heat, cold air, water and the dietary and diagnostic methods including x ray" These proposals would require any person desiring to practice chiropractic first to obtain a license from the chiropractic board, "which license shall not entitle such person to practice anything other than as defined in this act and provides further that nothing in the act shall be construed to allow chiropractors to prescribe or dispense drugs or to practice surgery, nor to prevent or restrict licensed practitioners of medicine or surgery, or osteopathy in their lawful practice." Section 13 of the senate proposal provides 'All laws, or parts of laws in conflict herewith are hereby repealed and the title 'chiropractor,' or the practice of chiropractic as defined in section 1 of this act, shall not be construed as practicing medicine or surgery or osteopathy" A similar section in the house bill omits the word "not" H 364, relating to hospital fees, proposes that when a state supported hospital has treated a patient who has been injured by the negligence of some person and thus has a right of action for the recovery of damages against such person, the governing authorities of such hospitals shall be subrogated to the right of action of the patient to the extent of reasonable charges for services rendered, including physicians' and surgeons' fees H 372 proposes a comprehensive licensing act for nurses and the creation of a Louisiana State Board of Nurse Examiners H 451 proposes a constitutional amendment authorizing the legislature to establish a system of medical care, treatment and attention to needy individuals and in connection therewith to erect construct and maintain a new charity hospital to provide adequate facilities for the proper care of the chronic and of the acutely ill, to provide adequate space and facilities for the treatment of needy individuals through a modern outpatient department and to provide necessary buildings for interns nurses and other personnel H 453 proposes that every railroad company or corporation operating railroads in the state which has collected or received hospitalization fees from its employees shall provide hospital facilities in the state of such capacity and equipment as will be sufficient for the care and accommodation of their sick or injured employees who are residents of the state H 561 proposes to authorize the granting of a divorce on due proof of the permanent and incurable insanity of one spouse, provided the insane party shall have been under the regular treatment for insanity and confined in an institution for the insane for a period of at least three years immediately preceding the commencement of the action The proposal would also require, before the granting of a divorce, a thorough examination of the insane person by three physicians who are recognized authorities on mental diseases one of whom shall be a superintendent of a state hospital for the insane and the other two shall be appointed by the court before whom the action is pending, all of whom shall agree that such person is incurable H 644 proposes the creation of a state board of pharmacy Among other things, the proposal defines the term 'prescription' as including 'orders for a drug or drugs or a chemical or chemicals or medicines or combinations or mixtures thereof transmitted to pharmacists through word of mouth, telephone, telegraph or other means of communication by a duly licensed physician dentist, veterinarian or other medical practitioner licensed to write prescriptions intended for the treatment or prevention of disease in man or animals and such prescriptions received by word of mouth, telephone, telegraph or other means of communication shall be recorded in writing by the pharmacist and the record so made by the pharmacist shall constitute the original prescription to be filled by the pharmacist." H 672 proposes to require all persons applying for a license to marry to file a certificate signed by a physician duly licensed to practice medicine by the Louisiana State Board of Medical Examiners, which certificate shall state that the applicant has been given an examination including a standard serologic test, for the discovery of syphilis, made not more than fifteen days prior to the date of issuance of such license, and that, in the opinion of said physician, the person either is not infected with syphilis or if so infected, is not in a stage of such disease which is or may become communicable to the marital partner H. 688 proposes to authorize any state board, commission or board of governors to proceed by injunction to enjoin and prohibit any person from the practice of any profession required to be licensed by said board, commission or board of governors when such person is practicing such profession and has not been granted a license.

### Missouri

*Bill Enacted*—S 456 was approved May 17, 1946 It provides for the creation of a division of the state department of education to be known as the division of registration and examination and assigns as boards of said division the State Board of Medical Examiners, State Board of Osteopathic Registration and Examination, State Board of Chiropractic Examiners and others

# THE WAGNER-MURRAY-DINGELL BILL

## Hearings on S 1606—To Provide for a National Health Program

(NOTE—*This is a condensation of the verbatim report of the hearings*—ED)

*(Continued from page 541)*

United States Senate Committee on Education and Labor

APRIL 26 1946

HONORABLE JAMES E MURRAY Presiding

PRESENT Senators Murray, Pepper, Smith and Donnell

SENATOR MURRAY I ask to have incorporated in the record a statement on behalf of the Coordinating Council of the five medical societies in Greater New York

### Statement of Miss Hazel Corbin, R N, General Director, Maternity Center Association

MISS CORBIN Needless maternal death can be banished everywhere in the United States That all mothers do not get good and safe and satisfying care is evident Last year nearly 200 000 women had no care from any qualified medical attendant whatsoever when their babies were born—and that was not just because of the war shortage of doctors The maternal death rate in many communities and in some states is as high as the worst national rate ever recorded in our history The latest Census Bureau statistics—that is, for the year 1943—show that New Mexico Arizona Colorado and other states have *maternal death rates far in excess of our national maternal* death rate in 1936 which was then considered by statisticians as the highest among the civilized countries with which we draw comparisons In Mississippi, New Mexico and Texas the Negro maternal death rate was double that for the white race In Virginia and New Jersey it was three times the white rate This is not evidence that Negro mothers are more prone to death in childbirth On the contrary in New York City during 1944 where 99 per cent of all mothers were hospitalized the maternal death rate for white mothers was 17 per 10,000 live births For Negro mothers it was 21 You see, when good care is provided to Negro and white mothers alike the end result is nearly alike In one Southern county during 1944 the maternal death rate was 84 per 10 000 live births One third of all the mothers in the country—the poorest third a large majority Negro—were delivered by nurse-midwives of the county health department These nurse midwives are public health nurses who have special training in obstetrics The mortality rate for this group of mothers was exactly zero! The stillbirth rate for the county was 45 9 per thousand live births For cases attended by nurse midwives the stillbirth rate was only 14

The *Maternity Center Association, which* I represent today, approved the proposed Maternal and Child Welfare Act of 1945, S 1318 introduced into Congress by Senator Pepper for himself and nine other Senators and by Representative Mary T Norton

We were therefore happy to learn that Senator Pepper has proposed a series of amendments to title I, part B, of the Wagner-Murray-Dingell bill which would incorporate the basic philosophy and the basic provisions of S 1318 It is our opinion that these amendments strengthen S 1606 and doubly assure the creation and maintenance of high standards in obstetric practice throughout the country We were also pleased that under S 1606, with Senator Pepper s amendments included, no means test would be required for maternity care.

It is therefore our hope that your committee will consider favorably the inclusion of the amendments made by Senator Pepper We hope too that an amendment may be added to require advisory committees on the state level

*(Senator Donnell questioned Miss Corbin regarding the work of the Maternity Center)*

SENATOR DONNELL Do you regard that general philosophy as correct namely to have grants MISS CORBIN For the state aid

SENATOR DONNELL For the aid to the states, federal aid, yes MISS CORBIN That is right

SENATOR DONNELL To carry out the plans administered by the state? MISS CORBIN That is right

SENATOR DONNELL Do you favor a plan under which, on the one hand, the federal government provides funds to the states to assist the states in carrying out state-operated plans as against a plan under which the federal government would itself operate a plan nationwide for maternal and child health services? MISS CORBIN Definitely

SENATOR DONNELL That is, you favor the state plan that I have indicated, aided by federal grants as against a federal plan of federally operated maternal and child health services, is that right? MISS CORBIN That is right.

SENATOR DONNELL You also mentioned, as I understood it, that you hope that an additional amendment will be made to part B of S 1606, namely an amendment which will provide for advisory committees on the state level? MISS CORBIN Yes

SENATOR DONNELL I take it by that you indicate the thought that the problems may be different in the different states, and that it is advisable to have local advisory committes to cooperate in carrying out the purposes of that part of the bill, is that right? MISS CORBIN That is right

### Statement of Mrs Mary H Oxholm, Chairman Spokesman for Children, Inc, New York

MRS OXHOLM Spokesmen for Children was incorporated under the laws of New York State Oct 3, 1945 with the purpose in view of (1) studying the health and welfare needs of children, (2) drawing the attention of the public to our findings, (3) enlisting public support for legislation affecting children considered sound by our board of directors and (4) opposing legislation that is considered detrimental to children. The officers of Spokesmen for Children are Mrs Theodor Oxholm, chairman Mrs Shepard Krech, treasurer, and Mrs Louis S Gimbel Jr, secretary The directors of our board are both lay and professional people who have a proved interest in maternal and child health and welfare. We have a nationwide membership of over 300 individuals Educational material provided by Spokesmen is being used by twenty-six other national organizations interested in children in the work carried on by their branches and affiliates

Spokesmen for Children has endorsed the Maternal and Child Welfare Act of 1945, S 1318, and members of the organization are in favor of the Maternal and Child Health and Services to Crippled Children Section title I, part B of the National Health Act of 1945 S 1606, H R 4730 although we regret that child welfare services are not included in this section. We believe child health and welfare services should go hand in hand that plans should be made to care for the whole child not just part of him

*(Mrs Oxholm described at length health care in Ulster County N Y)*

For the sake of our children we believe every state should be encouraged to develop a maternal and child health program and when necessary should be given federal grants-in aid to accomplish this goal

### Statement of Dr T Duckett Jones, Representing American Council on Rheumatic Fever of American Heart Association

*(Dr Jones presented a comprehensive statement on rheumatic fever and concluded)*

DR JONES "This conference is strongly in favor of the extension of public programs supported by federal state and local funds for the study, prevention and treatment of this disease"

SENATOR PEPPER Do you feel that the people of the United States are getting the medical care that they are entitled to have, for example with respect to say rheumatic fever and heart disease? DR JONES I would not hesitate to say that I feel not only myself, but other members of the Rheumatic Fever

Council do not feel that they are, or they would not have directed me to come here to make such a statement to you

SENATOR PEPPER And do you look on this bill as contemplating a plan or program by which the people who need medical care respecting rheumatic fever may obtain such care more adequately? DR JONES Senator Pepper, could I express that opinion as an individual, because I have not been directed by the council and it has not studied that?

SENATOR PEPPER Your individual opinion DR JONES I personally feel that it is the logical means whereby good programs of care and at least a beginning in the eventual accomplishment in this problem can be made

SENATOR PEPPER Doctor, do you feel that the voluntary plans will achieve that result and give the people the care that they should have in this field? DR JONES Again personally?

SENATOR PEPPER I mean that. DR JONES From my personal point of view, I work for voluntary agencies and feel that voluntary agencies and services and facilities have a tremendously important part to play in any program I personally feel however, that they will never successfully meet all of the pattern necessary in order to give a complete care program to individuals with these diseases

SENATOR PEPPER And one of the reasons is that generally the people by experience with voluntary plans, the people who need it most do not join or join and stay in a little while and then drop out? DR JONES Well I should say that, so far as this disease is concerned, the majority of the individuals getting the disease are either in the lower middle income level or in the actually lower income level both of which groups have difficulty in meeting voluntary insurance patterns, and that those plans are as yet not complete enough to give full coverage and it is my opinion that they probably will not be able to That is a personal opinion

SENATOR DONNELL Dr Jones you state, of course, that you are giving your personal opinion DR JONES That is right, sir

SENATOR DONNELL And that the authority that has been conferred on you by the council for which you appear is limited by the resolution that you read That is correct, is it not? DR JONES That is true, because the council has not met and has not considered the bill

### Statement of George J Hecht President, Parents Institute, Inc

*(Mr Hecht stated that he was a publisher of magazines)*

MR HECHT I feel that the children of America are being made in this bill the football of medical politics I feel that the maternal and child welfare provisions of this bill namely title I (B) is virtually a rider, having little to do with the main purpose of the bill, namely compulsory health insurance. As you all know I am sure, this bill has very little chance of passing this session of Congress It is a highly controversial bill and I understand that Senator Barkley on the floor of the Senate has said that it is the intention to adjourn the session by the end of July or beginning of August

---

APRIL 30 1946

HONORABLE JAMES E MURRAY Presiding

PRESENT Senators Murray, Pepper, Morse and Donnell

### Statement of Charles G Bolte, Chairman, American Veterans Committee, Accompanied by Dr E Richard Weinerman, Chairman, Health Subcommittee, American Veterans Committee

MR BOLTE The American Veterans Committee is an organization of World War II veterans which is working for a more democratic and prosperous America and a more stable world. One of the cornerstones of a more democratic America is adequate medical care for all its citizens regardless of financial status I have with me eighteen to twenty telegrams from American Veterans Committee chapters from Rhode Island to Washington and from Detroit to Dallas Texas

Some veterans were frankly amazed and hurt on their return from overseas to learn from their wives that the medical profession had actually fought this E M I C program and continued to attack it even after it had proved its importance. As yet this program has not undermined our American way of life as opponents of such matters always seem to warn.

*(Mr Bolte condemned the medical profession on many counts such as the fee schedules for veterans service He praised the Army Medical Service)*

We are convinced that we cannot depend on the so-called voluntary plans for our total health needs These depend for their survival on the uncertainties of personal choice to join or stay out and seem doomed from the start to a precarious and actuarially unsound existence

*(In response to questions from Senator Donnell Mr Bolte said his organization had 50 000 members He himself had gone directly from Dartmouth into the Army He told how different chapters had voted on the health program)*

*(Senator Donnell questioned Mr Bolte and his adviser Dr Richard H emerman as to free choice of physician and control of medical practice under the bill also as to costs)*

SENATOR DONNELL You have made a study of the British system to ascertain whether or not there has been a change for the better or for worse, generally speaking, in Great Britain as compared with the situation before the institution of compulsory health insurance? DR. WEINERMAN I was fairly fortunate because in the Army before the invasion and before we went to the continent, I was stationed as an army medical officer in England and found I was fortunate enough to have been billeted in a private English home at a small community where I stayed for some months, and being a doctor and interested in these matters I made a point to talk to both doctors and people about the health insurance plan in England, and despite the fact that the medical profession in England today is opposed to further extension of their plan which is quite different from this bill, they have had, for many years, a health insurance plan which is more similar to this bill and which the British Medical Association and the doctors in England are very much in favor of They like their health insurance plan The doctors I spoke to told me so The people I spoke to pointed out that the thing that is important over and over again was that the cash barrier to their family physician had been removed By prepaying the small amount that was required they went to the doctor when they thought they had to go to the doctor That was the biggest feature That made preventive medicine possibly not to a complete extent but far greater than ever had been possible before I think because of that and because of the closer contact between patient and doctors, that the quality of medicine in England was improved from what it had been

*(Dr Weinerman attacked an advertisement against the Wagner-Murray-Dingell bill issued by the Pennsylvania State Medical Society)*

SENATOR DONNELL Doctor you are not seriously contending to this committee that the expression of the House of Delegates of the American Medical Association is not a current up to date expression? You are not contending that, are you? DR WEINERMAN No I believe it is a majority expression It does not allow for exact up to the minute expression or for a large minority expression

SENATOR DONNELL Let us get a little more modern time Let us take April 22 This April 30 Eight days ago Let us take the stated meeting of the Medical Society of the County of New York where there was a certain series of resolutions adopted by a vote of 503 to 152 My information is that this took place at the conclusion of a forty-five minute debate That would be a modern up to date expression by the New York Medical Society would it not? DR WEINERMAN Yes sir I should think it is quite significant that 150 something of those doctors stood up in favor of such legislation when the claim has been made that the vast majority, perhaps 90 per cent of the doctors are opposed I think it is significant. SENATOR DONNELL It is quite significant also is it not, that 76 and a fraction per cent voted for these resolutions That is significant, likewise? DR WEINERMAN Yes

*(Senator Donnell read into the record the resolutions of the New York County Medical Society against the Wagner-Murray-Dingell bill)*

SENATOR DONNELL We do agree, do we not on the fundamental integrity of the American Medical Association and of its effort whether mistaken or not, to give an honest view to the American public on the subjects on which it expresses itself? DR WEINERMAN Senator, in answer to that I would have to say this That as a doctor, knowing about S 1606 as so many doctors do only through my mail and through what I read in the medical journals if I were as busy a practitioner as is the

average doctor and had no time to study the bill itself but only to read my mail and to read the medical journals, I do not think, Senator, I could truthfully say that I would have an unbiased opinion of the bill. And that is the way most of the doctors have come to take a stand on this bill.

SENATOR DONNELL. Doctor, I do not think that answers just what I asked you, namely, as to whether we would agree on the fact that, whether mistaken or not, the American Medical Association is attempting to give to the public what it considers to be an honest expression of opinion. We would agree on that, would we not? DR. WEINERMAN. Well, sir, I think we would agree that the American Medical Association is attempting to give to the people its analysis of the bill.

SENATOR DONNELL. Yes, and it believes itself to be giving an honest expression of opinion. We have no doubt of that, have we? DR. WEINERMAN. I suppose not.

SENATOR DONNELL. You are yourself going to apply for membership in the American Medical Association, as you have stated? DR. WEINERMAN. Yes, sir.

*(Senator Donnell queried Dr. Weinerman about the National Physicians Committee and other organizations opposed to the bill.)*

*(Dr. Weinerman related that he is now employed by the Department of Agriculture.)*

MR. BOLTE. I tried to emphasize in my testimony the feeling that veterans had about medicine. I think the Senator's questioning rather tended to get us away from that major line of emphasis. It seems that we have come out of the war with a feeling about medicine that most of us got better medical care in the Army than we ever had before. We went up when we were sick, when we went on sick call we had to go on sick call, and we did not have to worry about having the money to pay the bills, because we knew that the doctor was there and we knew that we got the very best of care. And I think a great many of us have come out wanting to continue that care personally and also to get it for our families. Because we just felt that we got better care in the Army than before and we want that to continue without the cash intervening and being a drawback and making us get sick because we do not have the money to go to a doctor when somebody in the family first begins to become ill.

SENATOR MORSE. Would you say that the experiences that you have had with medical care in the Army have tended to educate the members of the Army, as a great many other citizens are being educated, to favor the clinic technic of medical treatment, where you pass from office to office within the clinic and come under the jurisdiction and care of qualified specialists on different ailments. MR. BOLTE. I think very much so, sir. We did get the benefits of specialized care, which we might not have had before, just from having the one family practitioner. We also got a tremendously increased development of what I referred to in the testimony as health consciousness, the importance of health and the importance of catching any illness or disease in its early stages; and actually an awful lot of us in the Army learned more about personal health and hygiene and the necessity of taking care of ourselves than we knew before.

SENATOR MORSE. Do you think that the health education program that has been carried on in this country, particularly during the last twenty years, and the increased emphasis during the last ten, plus the experiences with medical care that the members of our armed forces have had during the war, has had a tendency among our people to decrease not particularly the importance of the family doctor but educate the people to the understanding that he is just, in most instances, the first adviser in the case of serious illness, and that he must be supplemented with clinical care? MR. BOLTE. I think that realization, Senator, has only grown up among those who have been able to afford constant access to a family practitioner, and beyond that to go on to a specialist. Most people cannot afford, certainly, the specialist, and a great many cannot afford the regular family practitioner and have had to have the welfare medicine, which of course is not at all similar to what is proposed under this bill.

SENATOR MORSE. As I have said before, I have certain reservations as to this plan which I will discuss at greater length on the floor of the Senate later but under this plan or some prepayment plan such as exists in my state and in the state of Washington do you think that one of the beneficial effects will be a greater development of the so-called clinical method of treatment rather than the one doctor method of treatment? MR. BOLTE. I should think it would, sir.

SENATOR MORSE. I perhaps ought to ask this of the doctor, rather than of you. Do you think it is a fair statement to say that members of the medical profession itself are recognizing more and more the importance of division of labor, shall we say, among specialists within their fraternity, rather than having a doctor try to qualify himself on all types of illness and treat in general practice? DR. WEINERMAN. Senator, I agree with you completely. I would like to say that Colonel Lueth reporting to the American Medical Association, surveyed some 20,000 of the army medical officers. One of the questions referred to group practice and, as I think Mr. Bolte has indicated in his testimony, half of all doctors polled indicated when they came back they would like to practice in a group.

SENATOR MORSE. Would I be unfair to the medical profession if I should suggest or at least raise the question as to whether it is true or not that in the field of modern medicine, with great discoveries that have been made in recent years, the new technics that have been developed in our medical schools, it is practically impossible for any modern day doctor to qualify himself in all the technics so as to give adequate medical attention to his patients? DR. WEINERMAN. Absolutely, Senator. The field is so complex today, and delightfully so—I mean that we have progressed so far—that a doctor can take a corner of medicine and become proficient in it. He cannot be efficient if he attempts to cover the entire field.

SENATOR MORSE. Would you say that as more and more new medical discoveries are made it is going to become less and less possible for the average doctor to qualify himself to give what we will come to believe is adequate medical care to his patients without the use of specialists and joint conferences with other doctors and clinical attention? DR. WEINERMAN. I think that is absolutely necessary, sir.

SENATOR MORSE. Well, if that should come to pass, or if that is coming to pass, and if the doctor is going to see to it, as I think the ethics of his profession require him to see to it that the best possible care is made available to his patients once he takes jurisdiction over the case, is it not true that the expense will be so great that millions of our citizens cannot afford to pay that expense. DR. WEINERMAN. Under the present system, sir.

SENATOR MORSE. Well, as this increased scientific knowledge on the part of the medical profession develops, which will call for what I have suggested to be clinical treatment and the attention of specialists—and specialists, rightly so, are expensive—is it not true that the average citizen will be unable to pay for the medical care that he ought to have if he was to have what I have phrased as adequate medical attention?' DR. WEINERMAN. Under the present pay as you go system, sir, that will be absolutely true.

SENATOR MORSE. Well let us talk in terms of trends anyway, because we have to think in terms of where we are going. It is a bit paradoxical, then, would you say, to find the opposition that we are finding among the medical fraternity to an attempt on the part of a society through its government to give to its citizens adequate care, find opposition to that, when the doctors themselves—and it is to their everlasting credit—through new scientific discoveries are enlarging the sphere of medical knowledge so as to make it more and more difficult for them to give adequate medical care themselves because of their limited knowledge, as individuals, of their own profession, and making it more and more difficult for them to give adequate medical care to the patient concerned because of his inability to pay for the specialized service that would be required? DR. WEINERMAN. It is inconceivable, Senator.

SENATOR MORSE. Frankly I do not want this record to close with any implication in it, if it is a false implication, that Mr. Bolte says to the Congress 'It is this bill or nothing.' MR. BOLTE. I would not want to give that impression at all.

SENATOR MURRAY. Right there I want to interpose this statement. That when the bill was filed by the sponsors it was expressly stated that we did not consider the bill perfect and the final answer, and we expect, of course, that the bill will be studied by this committee and that some improvements will be made to it. That is the situation in every bill that has ever been filed in the Congress since I have been here. I know of no perfect bill that ever went through Congress. I am sure that the bill can be improved on as a result of our study, but the basic concept of the bill will, I think, continue to be recog

nized as absolutely correct MR BOLTE I assume, sir, that your committee as a result of these hearings would, quite probably, do some redrafting

SENATOR MORSE In other words, you recognize that in hammering out any legislative pattern in the Congress of the United States it comes out a compromise pattern. That is the way democracy works in the halls of Congress fortunately so Well now, in this instance let me say that the Senator from Missouri again, as I have found to be his custom, is raising very important points that deserve the careful consideration of a committee such as this on the legislation that comes before us and I think he has raised some vital points here this morning that the members of this committee are going to have to consider carefully and out of which discussion I think some compromises will flow Let me mention one My thinking on it has not crystallized at all You remember that you were cross examined by the Senator in regard to the provisions of the bill that pertain to a limit on the maximum number of patients that a doctor under the plan may handle That concerns me too I am not ready to phrase the amendment But I take it for granted that any amendment which would permit of flexibility as to the number of patients that a doctor can handle in accordance with special abilities—some doctors can handle more than others—certainly would not defeat the basic objective of the bill MR. BOLTE I should not think so Senator

SENATOR MORSE I think some serious consideration should be given by the proponents of this bill to the matter introduced by the Senator from Missouri This matter of choice which the Senator refers to I think, is a pretty important one. May I put this question to you on that matter A great deal of emphasis is being made here that part of the medical profession an overwhelming majority of the individual doctors that are opposed to the bill, believe that it is going to do something to the medical profession as a part of our private property economy Do you think it is unfair to say that at the present time the choice which the average American citizen is free to exercise in selecting his doctor largely bottoms on his economic ability to pay for that choice? MR. BOLTE I think it is absolutely essential to say that, Senator It seems to me that the passage of this bill would actually provide so much more choice than the average citizen now has that there is simply no comparison. I know people personally who do not have any choice of doctors at all when they get sick. They take what they can get in the charity ward. They do not have any choice whatever I think this bill provides for a broadening of choice.

SENATOR MORSE In connection with this issue of choice, Doctor do you think that it is unfair for me to suggest that the economic status of the patient not only determines to a large degree in this country what doctor he is going to get to treat him but that the doctor himself in giving such treatment as he does give, is influenced somewhat to varying degrees—depending on the individual but to varying degrees—by the economic status of the patient once he accepts him as a patient? DR. WEINERMAN Do you mean sir that he is limited in the amount of treatment he can give him because of what he can afford? SENATOR MORSE Yes DR. WEINERMAN Yes I think that is right.

SENATOR MORSE We are right down here in this issue to the discussion of some basic political philosophy too How far should a representative government go in protecting the health of its citizens? That cannot be escaped in the discussion of this bill do you think? DR WEINERMAN No sir

SENATOR MORSE We are now on this free choice matter After all the extending of charity treatment by the medical profession fine as it has been, has not been adequate to give adequate medical care to large numbers of American citizens that have not had the funds with which to pay for it do you agree? DR WEINERMAN I agree. May I add, sir that as veterans we are not looking forward to charity medicine. We would rather prepay our own way

SENATOR MORSE I am talking now about the population as a whole. In spite of all the good work the medical profession has done by way of giving freely of its service to so called charity cases the fact is that that exercise of free choice on the part of the medical profession has not been sufficient to give adequate health protection and treatment to large numbers of our people. DR. WEINERMAN I would agree to that from personal experience, sir

SENATOR MORSE It has been my observation that when cases have been pointed out to the medical profession it has never failed to give its attention I know of no case where it has not given attention I am a member of various clubs and lodges and service organizations We have had our so-called crippled children's program and dental program and health program, where we call the attention of the medical profession of our city and county to outstanding cases and they always respond But we know that where we pick out one case there are many, many cases that we do not even know about and nobody knows about which go unattended If as of tomorrow the medical profession said 'We will handle all of the cases" it would not be very long before they would be wanting a lot of financial assistance to do it do you not think so? DR WEINERMAN And administrative assistance too

SENATOR MORSE If this service is to be rendered it has to be paid for DR. WEINERMAN I think it is worth our paying for

SENATOR MORSE We must take into account all of the modifications that will have to be made when we take up the question of military service rejections Some of them are congenital Some of them could not be helped by the medical profession at all. But boiling them all down we still had too many young men—too many young men who did not meet the minimum health standards which we in our civilization of which we are wont to boast, have not had MR. BOLTE And it was a shocking experience to all of us Senator I think.

SENATOR MORSE Now, on this subsidy matter on the basis of the questions I have already asked, the facilities already provided the medical profession and the patients of this country constitute a form of subsidy is that not true? DR. WEINERMAN Yes sir, I think a great percentage of the hospitals that already exist are governmentally owned.

SENATOR MORSE Do you see any great difference between some subsidy in the payment of medical fees for protection of American health and the payment of American tax dollars that are now being paid for the protection of American health and money that goes right into the pockets of veterinarians for the protection of the country's livestock? MR. BOLTE I think what we hope for under this bill Senator is that we will come to the point where we will take care of all our people as well as we take care of our livestock.

SENATOR MORSE Or try to It is surely as important to eliminate contagious diseases by way of federal support, if necessary among the poor people of the country as it is to eliminate Bang's disease among the cattle of poor farmers of the country because their herds are likely to spread it to those of the rich farmers too MR. BOLTE I should say it is at least as important yes sir

SENATOR MORSE Which again gets us back to this basic problem of what is the obligation in a constantly evolving but we hope progressively evolving society a democratic society with representative government to protect with tax dollars the health of all our people that is the thing that I have to wrestle with all the time Because at least I think—I suppose there are those who doubt it—I am as strong a proponent of private property economy as anybody in the Senate. But I recognize that too little government is just as dangerous for public welfare as too much government Hence I say to my friends although there are certain parts of this bill that I am going to discuss by way of proposed amendments later on there is no getting away from the fact that we have to move in the direction of adequate health treatment of all our people

We had a discussion here this morning with questions and answers about the views of the American Medical Association whether or not they are honest views I share the opinion of the Senator from Missouri that they are honest views on social and economic questions But my question will show the one modification that I would make and the question is this Do you agree with me Doctor that the members of the American Medical Association that testify in opposition to this bill are special pleaders in the sense that they are testifying from a particular economic point of view? DR WEINERMAN Senator that is fairly difficult to answer The ones that testify may have a far more favorable point of view than the great mass of doctors whom they purport to represent

SENATOR MORSE The opponents are using and I think very effectively judging from my mail the slogan "political medicine Would you agree with me that in democracy, in any democracy, politics is in its high sense represented by rule

of the majority but at the same time the protection of the legitimate rights of the minority within our constitutional guaranties, but that politics is to be desired and not deprecated in the administration of a democracy? DR. WEINERMAN With that definition of the term, yes, sir

SENATOR MORSE And that if we are really going to promote the greatest good for the greatest number within a private property economy we must make political approaches through government to it? DR. WEINERMAN Certainly, sir

SENATOR MORSE We, as your representatives, are politicians of course but that does not mean even contrary to cartoon conceptions that we seek only banal and undesirable objectives We can even have high motives too DR. WEINERMAN I think the framers of this bill did sir

SENATOR MORSE And under our form of government you cannot tackle a problem such as adequate health programs for all the American people except through our political forms I know of no other way of doing it in a democracy Do you? DR. WEINERMAN No, sir

SENATOR MORSE I will simply close by this observation that I think this is a great debate that is going to be confronting us because it has many ramifications on how to strike this balance between fulfilling what I think is a necessary objective of a democratic form of government and at the same time protect the legitimate private property rights of the medical profession that is the balance we must strike in the final solution of this bill I think it can be ironed out so that one can be struck I tell my doctor friends that it never will be struck because of the obstacles inherent in the situation if we simply say to the American Medical Association We turn it over to you and place on you the professional responsibility of providing adequate medical attention to 130 million American people It never has and physically it never will, without the friendly cooperation of the government I want to see a bill drafted and amended so that the two groups can work together That is not going to be done in my judgment to the satisfaction of the medical profession if the American Medical Association overemphasizes the special pleading aspects of its case

*(Senator Pepper took up the questioning and explained certain points of control in the bill)*

SENATOR PEPPER Now I happen to be a lawyer by profession gentlemen and occasionally we have lawyers that have to be disbarred, and sometimes we have lawyers that engage in sharp practice Sometimes no doubt, they engage in unfair practice with respect to their clients Now is it unthinkable that there might be a few doctors among all this great army of doctors who might, for the benefit of the additional fees try to undertake to serve more patients than they could give as the bill says a high standard of care? DR. WEINERMAN I think one of the main contributions of the American Medical Association to the country has been its very vigilant safeguarding of quality and exposing and even disbarring if I may use that term certain physicians that have malpracticed

SENATOR PEPPER Now, the Senator from Missouri has spoken about the good moral quality and the high purposes and so on, of the American Medical Association, but this bill would not be limited to practice just by members of the American Medical Association, would it? DR. WEINERMAN No, sir

SENATOR PEPPER Any doctor that is a qualified doctor under state laws would have the right as the bill specifically gives him to take patients, if patients select him under this bill, would he not? DR. WEINERMAN Yes sir

SENATOR PEPPER So there might be a great many doctors who are not in the American Medical Association? DR. WEINERMAN Yes, sir but in all fairness I believe the great majority of practicing physicians are in the American Medical Association

SENATOR PEPPER It is no disparagement to say that there may be a few of its members who would yield to the pecuniary opportunity of taking care of more patients in order to make more money than they can really give care to the patients It is just a matter of balance of interest There may be a few fellows that might take advantage of the patients and in order to make more money take on more patients than they could accommodate You have to balance that possible detriment to the public as against the technical denial of choice if the Surgeon General should exercise the authority that this section (j) gives to him do you not? DR. WEINERMAN Yes, sir

SENATOR PEPPER And it is all right if you want to find out how many cases of abuse there are but that is pointed out by some of the critics of this legislation as the effort of an authoritarian state—as some of these gentlemen are now beginning to call a government that does anything to help the people—that this is designed by people who have the point of view of the authoritarian state to deny the individual the right to a free choice of doctors You do not think that is a fair way to describe that provision in the bill? MR. BOLTE That is just what I said earlier to the Senator That this is in effect putting into law what already exists in common practice DR. WEINERMAN Senator, might I say with regard to this section (j) of which you are talking that the millions of Americans literally millions who for the first time in their existence will have access to any physician in their community far outweigh the hypothetical few that may come late to their favorite doctor and have to go to another Now, I recognize the justice of the criticism that occasionally a few people may not get the doctor of their first choice, but we are considering the common good, and when you weigh that, sir, against the millions that will have medical care for the first time, do you want to throw this bill away because of that point? I think that is a very false construction

SENATOR DONNELL I hope Senator Pepper and Senator Morse do not leave because I have enjoyed a very eloquent address here Senator Pepper's address was beautifully phrased and presented, as it always is

SENATOR MURRAY Under this bill, instead of witnessing any deterioration of professional ability or character of service, will it not mean a vast improvement to the great majority of the medical profession DR. WEINERMAN Well, Senator, when we talk about quality of medical care we should really talk about it and not just use the word Quality of medical care means having the doctor give the patient not only the best service that he knows how to give but all the service that the patient needs at the time the patient needs it Now, today, as has been pointed out by Senator Morse and others the doctor is able to give his patient if the patient comes to him at all, only such services as the patient can pay for or as the doctor is willing to give free There is a very difficult limitation Under the bill such financial barriers are broken down and the quality of service becomes exactly the quality of medicine that the individual doctor is capable of If he is a good doctor, he will give good service

*(Senator Murray explained how the bill conserves the quality of medical care)*

SENATOR PEPPER I want to apologize to my able friend from Missouri that I am going to miss his brilliant continuation of this inquiry, but I want to leave my interest to my good friend Dr. Morris Fishbein, who is somewhat acquainted with this subject in case something else may come up

(Senator Pepper leaves at this point)

SENATOR DONNELL In the first place, before starting the questioning I appreciate the point of view of the chairman, of course, and of the Senator from Florida and the Senator from Oregon I think it is a fine contribution that each of you gentlemen has made to the discussion of this measure, to point out, through effective questioning which I appreciate is not quite the type of questioning that would be sustained by a judge in court as against objections on the ground of pleading But nevertheless I myself have asked the same kind of questions and I think that this is a forum in which we may not only question the witnesses but to some extent indicate views and trends

I do not desire to have my question understood as making determinative whether or not this bill shall be adopted, the decision of the question as to whether this bill properly protects the private property rights of the doctors I do not regard that as the fundamental question at all I appreciate, Mr Chairman that the doctors have expended years of time and quantities of money in the acquisition of education, and I think they are entitled to consideration of that standpoint too But as I see it there is a much broader question here than the mere preservation of the property rights I am sure my close friend from the state of Washington likewise regards that as subordinate to the larger questions of national public policy We have here as I see it questions of private initiative, the preservation of the system of private initiative, that is involved at least to some extent in this case So I do not want it to be understood that I am standing on the proposition that whether this bill should be supported or not is to be determined by its effect on the private property rights of doctors Senator Morse made the point that these gentlemen of the American Medical Association are in a sense special pleaders Are you of the opinion, Doctor, that these members of the American

Medical Association by and large who are opposing compulsory health insurance are doing so because they think it is going to hurt them financially? Is that their reason for doing it? DR WEINERMAN No, sir, I do not think that is their reason

SENATOR DONNELL You do not think they are here in the sense of coming here and advocating something simply because of its effect on their own pocketbooks do you? DR WEINERMAN Senator, I think a few doctors probably feel that they would be hurt I think the mass of doctors do not feel that and their opposition to the bill stems from other things

*(Senator Donnell questioned Dr Weinerman at great length about conditions of medical practice and social activities Dr Weinerman replied authoritatively although it was clear he had little first hand knowledge of much that he spoke about*—ED)

*(There was extended discussion of the organization functions and power of the advisory board created by the Wagner-Murray-Dingell bill)*

---

AFTERNOON SESSION

### Statement of Mrs Charles W Sewell, Administrative Director, Associated Women of the American Farm Bureau Federation

MRS SEWELL I am coming to you as a farm woman an Indiana farm woman, engaged at the present time as the administrative director of the Associated Women of the American Farm Bureau Federation In the American Farm Bureau Federation the Associated Women are an entity and an affiliate and our membership is deemed as on behalf of the wives or members of the family of an American Farm Bureau member

*(Mrs Sewell covered much the same material as given to the conference on rural medical care)*

We are greatly interested in proposals designed to provide compulsory federal hospital and health insurance Our chief concern is to get more adequate medical care and hospitalization for our farm folk. We are wondering if the personnel set up to administer such a health program would know no more about the subject than those placed in positions of authority in other government bureaus dealing with agriculture

We wonder if it would require as many trips to the county seat to secure stamps for medical care as it has done to get gasoline tires farm machinery and rubber boots in order to carry on agricultural production.

We wonder if the stork could delay his visit while necessary red tape was cut, or if we might receive a directive such as the sheepmen were presented advising them in the face of shortage of herders for the critical lambing season to 'postpone the lambing until more favorable weather"

We have repeatedly expressed our opposition to compulsory insurance plan by resolution

In short I am trying to tell you that the American farmer wants adequate medical care and hospitalization at reasonable cost he wants the medical profession both as individuals and as an organization, to acquaint themselves with the needs of rural America and our attempts to formulate programs that will help to fill them Only with adequate farm income can we hope to realize adequate medical care The parity principle must be extended to medical care. For example an appendectomy at $150 when corn is $1 per bushel is vastly changed when corn drops to 30 cents per bushel

We believe such problems will be best attacked at the local level in conferences arranged between organized groups of farm people, the hospital associations public health officials and county medical societies all working together at that local level in friendly discussion Here each will be fully aware of the exact conditions in that particular area There will be no need for lost motion or loss of precious time between such groups no expensive record keeping and no yards of wasteful red tape to untangle or unwind.

SENATOR MURRAY How long have you been studying this problem of the need of medical care in the rural sections? MRS SEWELL Fourteen years

SENATOR MURRAY What have you done during those fourteen years to bring about a better distribution of doctors and hospitals? MRS SEWELL We have tried very hard to accomplish an educational program of the need for prepayment of medical care and hospitalization program

SENATOR MURRAY But yet the situation is such that great areas in the rural sections of the country are without adequate modern medical care and hospitalization? MRS SEWELL Of course we cannot leave out the last four or five years of the war and put back the doctors

SENATOR MURRAY The only part you disagree with is the part which provides for the compulsory insurance system? MRS SEWELL The part which provides for the compulsory insurance system

SENATOR MURRAY If it were not for that if it provided a voluntary system you would be satisfied MRS SEWELL I think we would so far as it coresponds with our resolution Again I could not go further than that until after another annual meeting when it would be brought to the delegates

SENATOR DONNELL Senator Murray referred to this as a long drawn out process of education I appreciate that any educational program takes a while but as a matter of fact this process of voluntary health insurance has been going rapidly in the last two or three years MRS SEWELL It has The Missouri Farm Bureau Women were the first to take this matter up and begin the organization in the little township units and into the counties and then Mr Chester G Starr was made the director and in the clipping service I have there you will find a typical report which appears by the action of the Missouri Farm Bureau

SENATOR DONNELL Does the Missouri Farm Bureau itself affiliate with the Blue Cross system? MRS SEWELL It acts in conjunction with the Blue Cross and there is a committee set up in the township which in turn works with the Blue Cross

---

MAY 1 1946

HONORABLE JAMES E MURRAY Presiding

PRESENT Senators Murray, Pepper Aiken and Donnell

### Statement of the Honorable Lewis B Schwellenbach Secretary of Labor

SECRETARY SCHWELLENBACH This is highly important legislation and should receive favorable consideration by the Congress at the earliest possible time

*(Secretary Schwellenbach repeated the phraseology of most of the proponents as to the state of the nation's health)*

According to a recent study made by the Bureau of Labor Statistics of family income and spending (Bulletin 822) average—and I emphasize the word average —average annual expenditures for medical care according to income class were in 1941, under 500 $27 500 to 1 000 $40 1 000 to 1 500 $63 1 500 to 2 000 $86 2 000 to 3 000 $102 3 000 to 5 000 $152 5 000 and over $310 Thus the highest amount paid on the average for medical care by families receiving a yearly income of less than $1 500 was $63 per annum. This figure is particularly significant since according to the same survey about 50 per cent of the families of this country received incomes below $1 500 in 1941 Over 33 per cent of the families received an aggregate income of less than $1 000 and were able to spend on the average only $27 to $40 per year for medical care. While incomes have increased since 1941 the costs of medical care have likewise increased A study by the Bureau of Labor Statistics discloses that the cost for all medical services plus medicines and drugs from 1941 to December 1945 increased 15 1 per cent, for medical services alone 17 4 per cent and for hospital services alone 27 8 per cent. I call to your attention the fact that these statistics refer to family income and not to individual income

The American Medical Association apparently takes the position with respect to the average person in the low income group that despite the absence of a large financial reserve he gets by very well Although the unpredictable illness may require budget payments he pays debts incurred within a reasonable time.' These contentions, however are not supported by the facts It is just not true that people of low incomes faced with the overwhelming burden of prolonged and serious illness 'get by very well'

No one who has given serious thought to medical care problems in this country can I am convinced, successfully challenge the basic conclusion that achieving adequate medical care for all the people requires that the costs be distributed over periods of time and over large groups of the population. Through national health insurance the costs of meeting the economic hazards

whose consequences are lack of essential services and dependency are reduced from the maximum which each individual must be prepared to meet to the average costs of affording overall protection Care is guaranteed by the financial stake each individual acquires through his payment into the insurance fund. Adequacy of care will be assured by the expansion of facilities and the development of services and training which this bill, together with the Hill-Burton hospital bill will make possible. The redistribution of medical costs that the proposed national health act will achieve will accomplish the spread of ability to pay and will direct federal funds into areas which have been unable to support doctors hospitals and laboratory equipment The program will eventually relieve doctors of the double burden of having to be both bill collectors and medical practitioners Furthermore, the bill will help to avoid the concentration of physicians in large urban centers where they are attracted by the possibility of stable income and will enable wage earners to support aggregate expenditures for medical care in a way to insure permanent stability of income to those who render medical care.

As I indicated at the beginning of my remarks, the Federal Security Agency and the Department of Labor have agreed that it would be desirable to include in S 1606 certain amendments which are intended to broaden the coverage of maternity care and medical care to children to include noninsured as well as insured and to make the care adequate for all mothers and children, to remove certain ambiguities and to provide for improved coordination in the administration of the provisions of title I part B, and title II These amendments have already been submitted to this Committee. I regard their incorporation into the bill as indispensable

SENATOR DONNELL Mr Secretary, may I ask you, please just what was the course of procedure adopted in the preparation of this statement? SECRETARY SCHWELLENBACH Well, the same procedure which is uniformly adopted in the Department of Labor I do not dictate the statements myself We had a meeting I had meetings with various members of the *staff when the bill first came up I read it and attempted to* study it and had my general ideas about it and then referred the various parts to Miss Lenroot, head of the Children's Bureau, and Dr Eliot of the Bureau of Labor Statistics, to get certain figures. The actual preparation of the statement was done in the solicitor's office in the department.

SENATOR DONNELL Do you know who was the person who actually prepared the statement? SECRETARY SCHWELLENBACH I think Mr Tyson actually prepared the statement

*(Senator Donnell, through questions brought out that Secretary Schwellenbach was not personally familiar with the proposed amendments to the Wagner-Murray-Dingell bill)*

SECRETARY SCHWELLENBACH I do not think that you will find in any department of government that there is a situation where if, as I have in the Children s Bureau, they come in with a recommendation that certain amendments should be made to a piece of legislation amendments involving questions in which they are particularly skilled and which they are trained by work and long experience, there is no question about it, I will not dispute it with you I did not prepare these amendments I did not think of them. They were prepared by experts

SENATOR DONNELL The point I am getting at is what I regard as fundamental This is not a criticism of you If there is any criticism I think it is of the entire system We have in your presence here this morning illustrated the prevalence of the practice of bringing in the heads of departments who incorporate into their statements what purports to be their own personal opinion as for illustration I regard their incorporation into the bill as indispensable SECRETARY SCHWELLENBACH When Miss Lenroot and Dr Eliot came in and told me these amendments were necessary, I accepted their views, and it becomes my view

SENATOR DONNELL I understand your statement on that, Mr Secretary The point I make is this that it appears to me what we really should have here, and this is not at all critical of you, what we should have is the personal opinion of the people who have studied these matters rather than merely the use of the prestige of the name of the member of the Cabinet of the President of the United States, who, naturally, could not possibly give detailed personal attention to all these details

SENATOR DONNELL There is a quotation in here from the American Medical Association, which is at page 8 You say apparently takes the position, with respect to the average person in the low income group that despite the absence of a large financial reserve he gets by very well' " I dare say, Mr Secretary, that you could not tell us here personally what the context is in which that is used by the American Medical Association or what publication? I am talking about you personally, what publication that appears in of the American Medical Association, could you? SECRETARY SCHWELLENBACH It was a statement by Dr R L. Sensenich, Chairman of the Board of Trustees, American Medical Association, printed in 'Health Insurance in America" It was a publication of the Chamber of Commerce of the United States

SENATOR DONNELL *Did* you see it in that publication or was that information given to you by somebody else who prepared this portion of this statement? SECRETARY SCHWELLENBACH The information was secured by someone else. That is true.

SENATOR DONNELL You have not seen that publication or the statement by Dr Sensenich yourself, have you? SECRETARY SCHWELLENBACH No, I have not

SENATOR MURRAY It seems to me this is somewhat irrelevant. If the statement is not true, if it is an incorrect statement, of course, it would be proper for you to show that, Senator, but it seems to me that if the statement is made and is taken from some publication the Secretary would be entitled to regard it as truthful and accurate If it is not it would be easy for some one to show that it is not.

SENATOR DONNELL I am not raising a question as to the correctness of the quotation I do not know the context, however, and neither does the Secretary, in which this is used

SENATOR MURRAY What difference would it make, whether he saw the original statement at the time it was published or whether he read it in some newspaper If it is true, that is the important thing

SENATOR DONNELL Have you ever read it anywhere in any newspaper or anywhere else SECRETARY SCHWELLENBACH I never read it.

*(Senator Donnell brought out that some of the amendments concern health insurance)*

SENATOR DONNELL Mr Secretary is there any one in the Department of Labor who has been directed to specialize along the line of study of compulsory health insurance in other nations? The experience that other nations have had in compulsory health insurance? Any one in your department who has been instructed by you or at your direction to make a study of the experience of compulsory health insurance in other nations? SECRETARY SCHWELLENBACH Unless the Bureau of Labor Statistics has been directed by the Congress to do it, I have not directed it, and it has not been done since I have been in, for ten months.

SENATOR DONNELL And you have not been informed of the fact that any one has been directed by Congress or any one else in your department to make a study of the experience in compulsory health insurance in other nations? I am right in that, am I not? SECRETARY SCHWELLENBACH Yes

SENATOR PEPPER Mr Chairman, I would like to intervene just to make an observation to my good friend Senator Donnell We are here for the purpose of trying to find out whether it is in the public interest to adopt this bill or not, and with all deference and respect to my colleague, he is conducting this examination as if the secretary were a criminal instead of a cabinet official, and he is trying to find out whether he is entitled to probity and credibility

SECRETARY SCHWELLENBACH Well—

SENATOR PEPPER Whether there are two titles, what are the numbers? The Senator, I assume, knows the number of titles in the bill To ask a Cabinet official how many titles are in the bill can only be for the purpose of trying to show that the Cabinet officer does not know anything about the bill I do not think that the Senator, on reflection, would want to encumber the record and take the time of the Secretary and his colleague with that kind of rather petty cross examination, if he will permit me to say so I hope that, since the Secretary has indicated he has read the bill several times and he has come here to testify about its substance and contents, that the able Senator will confine his inquiry to the substance and substantial merits of the matter and some of the substantial things which the Secretary said which the Senator has every right to controvert in any way he might want to do so Is that not a fair suggestion?

SENATOR DONNELL Mr Chairman, I appreciate the suggestion from my friend the Senator from Florida, but I may say this, that I think the Secretary would not at all coincide in

the statement that I have conducted this examination as if the Secretary were a criminal. SENATOR PEPPER. I withdraw that

SENATOR DONNELL. Mr. Secretary, has there been anything like that presented to you this morning? SECRETARY SCHWELLENBACH. No. I do not think there is much sense in some of the questions, but I do not mind it.

SENATOR DONNELL. There is a disagreement and every person must use his own judgment. I may say to the Senator from Florida that the theory on which my questions are asked of the Secretary was that the Secretary of Labor comes here with great prestige, and justly so. The statement that he makes goes out all over the nation as the statement of the Secretary of Labor and is entitled to great weight from that standpoint. I think it is perfectly filled with sense if I may use that expression, to interrogate the Secretary as to his own personal knowledge of the contents of the statement which goes out of here with the personal pronoun "I" expression of opinion. I think we are entitled to know, and I think in any proceeding in the land, before a Senate committee, House committee or a court, the examination I am making is perfectly proper.

SENATOR PEPPER. You are exactly right. In a technical court, where you were trying to break down the witness and show he had not personally observed everything he talked about, in a court of law, where a trial was being carried on, the Senator is absolutely correct and he has followed that procedure all through this case, as if he were trying a bitterly contested law suit, and subjecting every witness to the most scrutinous and most severe cross examination which he, as a very eminent lawyer, is able to apply, and I put, at rather long last, the point as to whether the Senator thought we were trying a bitterly contested lawsuit here and that we had to apply to every witness all the cross examination which the able Senator is able to apply to a witness in a lawsuit. If we are trying a lawsuit, we can draw this thing out for six months but I was hoping that the Senator would not ask every witness how many titles were in the bill and all the little things that have but one purpose, and that is trying to make a meticulous inquiry of every word. And all the time the Senator is asking these questions he is sitting at the counsel table advised and assisted by an expert handing him papers and giving him counsel.

SENATOR DONNELL. Yes, which I think is extremely valuable.

SENATOR PEPPER. I do not complain about that with all deference to the Senator. He has brought out some very fine points. But could he not regard this as a hearing before a Senate committee, where we are trying to get the facts and limit his cross examination to questions that would be a little bit more to the general merit and content rather than the character of cross examination in the courts? I submit that with all deference and friendship to the able Senator from Missouri.

SENATOR DONNELL. I appreciate the courtesy of the Senator from Florida. I still submit, however, that inquiry as to the personal knowledge of a witness is of importance and I think that the examination that I have conducted is entirely proper.

*(The debate continued on the nature of Senator Donnell's examination of Secretary Schwellenbach.)*

SENATOR DONNELL. Mr. Secretary, have you read the testimony submitted by the Public Health Service to this committee? Have you read it yourself? SECRETARY SCHWELLENBACH. No.

SENATOR DONNELL. Do you know who testified on behalf of the Public Health Service to this committee? SECRETARY SCHWELLENBACH. No.

SENATOR DONNELL. Let me read you this sentence and this again is not said critically of you but of the system. At page 3 you say: "I am sure you all must have been impressed, as I have been, with testimony submitted by the Public Health Service to your committee ." Now you have not read it and you never saw a line of it did you? SECRETARY SCHWELLENBACH. I think your criticism is absolutely right on that one.

SENATOR DONNELL. I think it is too. I will not pursue this line of questioning further but I think it has been developed here first that there has been a change in the plan that prevailed when the distinguished Secretary was in the Senate. In those days the Senate did not follow the practice of bringing in the top head man in the department, at least to the extent they do now, like the Secretary of Labor. In the second place, we have developed the fact that the Secretary did not write one word of this statement, although he said he struck out a portion of what was submitted to him. SECRETARY SCHWELLENBACH. I made a lot of suggestions.

SENATOR DONNELL. I have no doubt of that and I should amend my statement to that effect. In the third place as the Secretary himself correctly says without any qualification, he thinks my point where it says 'I am sure you all must have been impressed, as I have been, with the testimony submitted by the Public Health Service to your committee' that my criticism is sound and is well founded. Am I right? SECRETARY SCHWELLENBACH. I agree. I should not have said that.

SENATOR DONNELL. Yes, sir. In the next sentence you say 'It is clear, I think, that there is ample basis for the conclusion reached by the Public Health Service that . .' maybe you agree with that?

SENATOR PEPPER. Allow me, at that point to say this will you note the two conclusions attributed to you and state whether or not you do, as an individual sitting here persona, not in absentia agree with those conclusions?

SECRETARY SCHWELLENBACH. Yes, sir. And I might tell the Senator I have had a little experience in the medical business. I practiced law in the city of Seattle for a good many years. I represented an insurance company. SENATOR DONNELL. Yes.

SECRETARY SCHWELLENBACH. I have had personal contact. SENATOR DONNELL. Yes.

SECRETARY SCHWELLENBACH. With all of the leading members of the medical profession there. SENATOR DONNELL. Yes.

SECRETARY SCHWELLENBACH. And I had a lot of experience with reference to the matter. About every night I would get into an argument with one of them. SENATOR DONNELL. Yes.

SECRETARY SCHWELLENBACH. About this general question. SENATOR DONNELL. Yes.

SECRETARY SCHWELLENBACH. And I told them then. I remember I made a speech before the King County Medical Association, probably in 1925. SENATOR DONNELL. Yes.

SECRETARY SCHWELLENBACH. In which I told them unless they would change their system and start out immediately on a voluntary system that the time was going to come when the government was going to take this up. SENATOR DONNELL. Yes.

SECRETARY SCHWELLENBACH. I never got very far in any of my arguments or any of my discussions. SENATOR DONNELL. Yes.

SECRETARY SCHWELLENBACH. This is not a new matter to me. I have been thinking about it for a long time.

*(There was much more debate on the nature of Secretary Schwellenbach's testimony and his lack of personal knowledge of his statement.)*

SENATOR DONNELL. Do you, generally speaking, favor the portion of the bill incorporated in title I as far as it pertains to the grants of aid for the carrying out of state plans? SECRETARY SCHWELLENBACH. Yes, subject to the amendments.

SENATOR DONNELL. To the amendments. I understand. Now Mr. Secretary, that is on the theory I think, at least in part, that the local state governments, the local people, the local administration are able to analyze local needs, generally speaking somewhat better than the national government, which is removed from the state to some extent is that right? SECRETARY SCHWELLENBACH. In some areas of the country that is true and in some areas unfortunately it is not true. If all the states of the Union had as forward looking ideas about the necessity of taking care of people as the state of Washington has there probably would never have been any need for the federal government to have any social programs. I am not making any comparison with Missouri (laughter).

SENATOR DONNELL. I was going to ask about Missouri. SECRETARY SCHWELLENBACH. There is at least one man from Missouri who has a very definite understanding of the needs.

SENATOR DONNELL. And that is the President whom you have in mind? SECRETARY SCHWELLENBACH. Yes, sir.

SENATOR DONNELL. Now this legislation you understand to be favored by the administration is that right? SECRETARY SCHWELLENBACH. Yes, sir.

SENATOR DONNELL. And you think it is in line with the recommendations of President Truman. Doubtless you are correct. That is your view, is it not? SECRETARY SCHWELLENBACH. Yes.

SENATOR MURRAY. Mr. Secretary in your statement here you set forth the medical expenditures of families in the various

income groups at the bottom of page 5 Now you do not know that statement to be correct of your own knowledge? You never made that study did you yourself SECRETARY SCHWELLENBACH No

SENATOR MURRAY Do you think that is any reflection on your credibility here today when you come to make a statement that this is true? You got the information I assume from somebody in your department? SECRETARY SCHWELLENBACH The Bureau of Labor Statistics makes those up

SENATOR DONNELL Have you read the recommendations of the House of Delegates of the American Medical Association with respect to this measure? SECRETARY SCHWELLENBACH No sir

SENATOR DONNELL So you did not take that into consideration in formulating your final opinion on the merits of this program SECRETARY SCHWELLENBACH No because my contacts were with the best doctors in Seattle and the best doctors in Spokane. I never agreed with them. They are part of the American Medical Association the finest gentlemen I have ever met. Now that does not mean that because they happen to belong to the Association and because the Association as a whole takes a position that I agree with them

SENATOR DONNELL I understand you disagree with them. You understand that your view here is expressed as diametrically opposed to the views of the American Medical Association? SECRETARY SCHWELLENBACH Yes I have made speeches before the Seattle branch of the American Medical Association

SENATOR AIKEN I think all of us have heard a good many doctors criticize the Association privately and quietly and do not dare to do it out loud for fear of consequences

SENATOR DONNELL You know, Mr Secretary as we do all of us that by far the great majority of all practicing physicians in this country belong to the American Medical Association we know that do we not as a matter of general knowledge? SECRETARY SCHWELLENBACH It is pretty nearly necessary that they do

SENATOR DONNELL They do? SECRETARY SCHWELLENBACH If you want to get into that subject Doctors like to get into hospitals, when they have patients who are sufficiently ill They want to get their patient into a hospital Very often they have difficulty getting into a hospital if they do not belong to the medical association which is a branch of the American Medical Association I know of one doctor in Seattle whom I succeeded in keeping out of hospitals but I had to do it because of the fact that he was not qualified as a member of the medical association.

SENATOR DONNELL That is to say he was a man that was not properly entitled, in your opinion to be in the hospitals and at the same time the society had not taken him in either that is correct, is it not? SECRETARY SCHWELLENBACH He was getting into hospitals despite the fact that every other doctor in town knew he should not be in the hospitals

SENATOR DONNELL And he was not able to obtain membership in the American Medical Association or the local medical society is that right? SECRETARY SCHWELLENBACH Well not on the basis of the methods and procedures that he used.

SENATOR DONNELL But at any rate Mr Secretary you are not undertaking to pass on the question as to whether an expression by the House of Delegates of the American Medical Association is fairly representative of the opinion of the medical profession you are not undertaking to tell us that? SECRETARY SCHWELLENBACH No I do not know anything about that matter

### Statement of Dr Martha M Eliot, Associate Chief of the Children's Bureau of the U S Department of Labor

(*Dr Eliot described her career*)

DR. ELIOT I have been responsible for the health work in the Children's Bureau and the programs of the administration of the Social Security Act since it was passed I am appearing here today in support of the National Health bill S 1606 Miss Lenroot, the chief of the Children's Bureau has asked me to express her great regret that she cannot be here to testify herself in favor of the national health bill She is in New York serving as the secretary of the Temporary Social Commission of the United Nations

The chief barrier to care is the ceilings on the amounts of federal funds available under the Social Security Act. At the end of the fiscal year 1945 there were 20 000 crippled children on state registers who were not receiving the care known to be needed The Emergency Maternity and Infant Care program has shown us how inadequate the facilities for good maternity care in many places are especially in rural areas Many maternity hospitals and homes are ill equipped to give safe care many physicians who include obstetrics in their general practice have had relatively little basic training and little or no opportunity for postgraduate training in this field Good maternity care available to all is a goal that is attainable within the next ten years if the authority to act and the resources to provide it become available

(*Dr Eliot stated that there are 41½ million children under 18 years of age*)

SENATOR DONNELL Might I ask one question there of Dr Eliot On the chart with respect to birth rates in each state I observe with great interest the fact that Iowa Missouri and Illinois in one group and over here New York New Hampshire and Massachusetts each appear to have less than 21 live births per thousand of population I believe New Jersey likewise is included in that list. I do not find that that prevails in any other part of the country What is the explanation of that DR. ELIOT I have no explanation, Senator

SENATOR AIKEN I think Mr Chairman the Senator from Missouri ought to explain that, rather than Dr Eliot. SENATOR DONNELL I could not do that with respect to the matter of the states of Vermont and New Hampshire as well as Senator Aiken could but it is a curious fact right in the center of our country there as to those three states

DR ELIOT Under the conditions which exist today the prospect that the baby's mother will live through childbirth that the baby will be born alive and will survive and grow into a sturdy well child, varies by reason of where he lives the income of his family and his race Over 7,000 mothers die from childbearing each year In 1943 the maternal death rate in Minnesota was 14 mothers per 10 000 live births In New Mexico it was 47 or over three and one half times as high If every state did as well as Minnesota the lives of 3 000 mothers would have been saved in that year Over 100 000 babies die in their first year of life in the United States The lowest rate in 1943 was in Connecticut, 30 per thousand live births In New Mexico which is the state with the highest infant mortality rate 92 babies died in their first year per thousand births If every state had done as well as Connecticut in 1943 the lives of 31 000 babies would have been saved The maternal death rate for Negro mothers was 143 per cent higher in 1943 than for white mothers In the same year the infant death rate for Negro babies during the first year of life was 64 per cent higher than for white babies Seven eighths of all urban babies were born in hospitals in 1943 compared with only one half of all rural babies Three fourths of white babies were born in hospitals in that year compared with only one third of Negro and other non white babies

SENATOR AIKEN Good roads have something to do with that too DR ELIOT Good roads have something to do with that, no doubt.

SENATOR PEPPER Excuse me Dr Eliot. Are you going to give us the number of deliveries that are by midwives? Do you happen to have that in these figures? DR. ELIOT I think we refer to them but I can tell you now it is something over 200 000 there are something over 200 000 women who do not have the care of a physician at the time of birth

SENATOR PEPPER How many births are there in a year in the country? DR. ELIOT At the present time they are running between 2½ million and 2,200,000

SENATOR PEPPER That would be about 10 per cent roughly DR. ELIOT Yes, or a little less than 10 per cent

SENATOR PEPPER A little less than 10 per cent then have no doctors let alone a doctor DR ELIOT That is right The state of Mississippi had the least favorable proportion of births in hospitals in 1944 when 69 per cent of all the births in the state were at home.

(*At Senator Pepper's request Dr Eliot described the E M I C program*)

SENATOR DONNELL Generally speaking would you say that the state health departments did a good job in carrying on the actual operations? DR. ELIOT Very decidedly, Senator Donnell

(*Dr Eliot gave statistics on handicapped children*)

DR. ELIOT All the data available would seem to point to the conclusion that it would be neither desirable nor feasible to undertake to exclude even a small proportion of children from

the benefits of this program and that we must talk in terms of all children, rather than selected income groups when establishing public responsibility for their health and medical care.

SENATOR PEPPER Mr Chairman may I interrupt just one minute? What you have said here is of particular interest to me Dr Eliot in wishing to know what your attitude toward the means test is in furnishing this care to mothers and children Do you favor a means test? DR ELIOT No Senator Pepper I would not Under this bill which would provide the personal health services through some federally collected funds whether it turns out to be what is known as insurance or some other method of collecting of funds so far not yet declared, nevertheless, under this bill all persons entitled to those personal health benefits would presumably get their care as a right, as an entitlement Now one does not want at the same time, certainly to introduce in another part of the same bill a provision which would establish a means test for noninsured children

*(Senator Pepper described 3 cases of people who could not pay for medical care)*

SENATOR MURRAY Would it be possible for these low income families and especially the larger families, to be provided for under a voluntary insurance system? DR ELIOT To my way of thinking, the amount that it costs to provide for really complete medical care of the kind that I visualize for these children under a voluntary scheme certainly would be impossible in the lower groups and by lower groups I mean the type that we have been describing here—say a family of four with less than $2 700

SENATOR MURRAY There was a lady testifying here yesterday who seemed to have great confidence in the idea that a voluntary system could be provided that would cover the entire country and give medical care to everybody in the United States It seems to me, in listening to her testimony that she had not given very careful study to the facts and was not familiar with the subject, as you seem to be You have made a careful study of it, and I think your judgment on the proposition that a voluntary system would not provide proper medical care for those families should be accepted by the committee

SENATOR MURRAY Would it be possible to get those hospitals in rural areas, in poorer sections of our rural areas of the country, without the hospital bill? I mean without this insurance system that we are talking about DR ELIOT Of course, one of the questions I raised when I was testifying as to that bill S 191, was "Who is going to care for the hospitals?" It is fine to build them but who is going to get the people into those hospitals? Either a provision has to be made there or somewhere because people simply cannot pay for hospital care for children for maternity care, in many many instances unless it is made possible for them We need a lot more professional personnel and I have listed here some of them We have about 2 500 pediatricians We reckon that we ought to have 7,400 We perhaps need 5 000 more obstetricians in the country to do a really good maternity care job for every mother in the country We need probably 34 000 dentists trained in children s dentistry We have now 19 000 public health nurses and we without question I think need 50 000 more We need some 15 000 additional graduate nurses for institutional and private duty We need some 10 000 additional psychiatrists That is a round figure because we do not know how many we need to handle these services for children For instance, there are twenty five states in which there is not a single child guidance clinic in any community in the state. Therefore there is no question of the need in that area

SENATOR MURRAY Are the present medical schools of the country adequate to furnish these? DR ELIOT It is awfully hard for me to answer that question Senator Murray I think we need more doctors There is not any doubt we need more doctors Now I do not know whether the present medical schools are sufficient if their facilities are expanded. But I know that certain of the medical schools are placed in smaller cities One I am most familiar with is Yale in New Haven You cannot undertake to teach too large a group of medical students within a given city where the clinical facilities for instruction are limited by the size of the city So just whether there should be more medical schools or whether the existing ones should be expanded I am not in a position to say I should think there might be a need for some more.

It has been asserted by various witnesses appearing before this committee—almost as a truism—that the quality of medical care will deteriorate under a national health program financed by an insurance plan which entitles all insured persons to care and permits per capita methods of payment to physicians and the establishment of panels The Children s Bureau experience in administering medical care programs however is that the quality of care can actually be improved The result under a national health program will depend on the amount of responsibility assumed by the federal state and local health agencies with the advice and assistance of the medical and allied professions for (1) the provision of adequate facilities (2) the establishment of standards of medical and institutional care (3) making available or arranging for consultation service and for facilitation of group practice of specialists and general practitioners, (4) review of care rendered (5) recruitment training and adequacy of remuneration of professional and technical personnel and (6) effective and fair administration in the interests of the people to be served and the persons and agencies furnishing service and care Improvement in quality of care can be accomplished even under conditions that call for a rapidly expanding service provided as a 'right This has been shown in a relatively small and limited way in the maternity and infant care offered the wives and infants of service men during the war

SENATOR DONNELL Have you read Dr Getting s testimony? DR ELIOT I think I have read it all I am not certain

*(Senator Donnell by his questions reemphasized the action of the Association of State and Territorial Health Officers as expressed by Dr Getting)*

*(To be continued)*

## Coming Medical Meetings

American Medical Association San Francisco July 1 5 Dr George F Lull 535 N Dearborn St., Chicago 10 Secretary

American Academy of Tuberculosis Physicians San Francisco June 30 Dr Oscar S Levin P O Box 7011 Denver 6 Colo Secretary

American Association for the Study of Goiter Chicago June 20-23 Dr Thomas C Davison 478 Peachtree St N E Atlanta 3 Ga Secretary

American Association for the Surgery of Trauma San Antonio Texas June 26-28 Dr Gordon M Morrison 520 Commonwealth Ave Boston Secretary

American Association of Genito Urinary Surgeons Stockbridge Mass June 20-22 Dr Charles C. Higgins 2020 E 93d St Cleveland 6 Secretary

American College of Allergists San Francisco June 28 30 Dr Fred W Wittich 401 LaSalle Medical Bldg Minneapolis 2 Secretary

American College of Chest Physicians San Francisco June 27 30 Mr Murray Kornfeld 500 N Dearborn St Chicago 10 Executive Secretary

American College of Radiology San Francisco June 29 Mr Mac I Cahal 20 N Wacker Drive Chicago 6 Secretary

American Medical Women s Association San Francisco June 29 30 Dr Beulah Cushman 25 E Washington St Chicago Secretary

American Neurological Association San Francisco June 26-28 Dr Henry Alsop Riley 117 E 72d St New York 21 Secretary

American Ophthalmological Society San Francisco, June 26-28, Dr Walter S Atkinson 129 Clinton St Watertown N Y Secretary

American Orthopedic Association Hot Springs Va June 27 29 Dr Charles W Peabody 474 Fisher Bldg Detroit 2 Secretary

American Physiotherapy Association Black Mountain N C June 16-22 Miss Margaret A. O Neill 1790 Broadway New York 19 Secretary

American Proctologic Society San Francisco June 30 Dr Harry E Bacon 2031 Locust St Philadelphia 3 Secretary

American Radium Society San Francisco June 28 29 Dr Edward H Skinner 1103 Grand Ave Kansas City 6 Mo Secretary

American Society for the Study of Sterility, San Francisco June 29 30 Dr John O Haman 490 Post St. San Francisco 2 Secretary

American Society of Clinical Pathologists San Francisco June 27 30 Dr A S Giordano 531 N Main St South Bend Ind Secretary

American Urological Association Cincinnati, July 22 25 Dr Thomas D Moore 899 Madison Ave Memphis 3 Tenn Secretary

Association for the Study of Internal Secretions San Francisco June 28-29 Dr Henry H Turner 1200 N Walker St Oklahoma City Secretary

Idaho State Medical Association Boise June 17 20 Dr F B Jeppesen 105 N 8th St. Boise Secretary

(PHYSICIANS WILL CONFER A FAVOR BY SENDING FOR THIS DEPARTMENT ITEMS OF NEWS OF MORE OR LESS GENERAL INTEREST SUCH AS RELATE TO SOCIETY ACTIVITIES, NEW HOSPITALS, EDUCATION AND PUBLIC HEALTH.)

## ALABAMA

**Personal.**—Mr. A. T. Rossano Jr., U. S. Public Health Service, recently director of the division of industrial hygiene, Colorado State Board of Health, Denver, has been appointed to a similar position for the division of industrial hygiene of the Alabama Department of Public Health.

**Gift of Portraits.**—A feature of the recent meeting of the Medical Association of the State of Alabama was the presentation of portraits of Hon. Chauncey Sparks, governor of the state, and Dr. William D. Partlow, Tuscaloosa. The portraits were given to the University of Alabama and were accepted by the president, Raymond R. Paty, LL.D., and for the Medical College of Alabama by the dean, Dr. Roy R. Kracke. The portrait of the governor was painted by Mr. Milner Benedict and that of Dr. Partlow by Mr. John Clary Parker, New Orleans. The gift denoted the appreciation of Alabama and friends of the governor and Dr. Partlow for their work toward procuring the Medical College of Alabama, where the portraits will hang.

**Faculty Appointments.**—On May 1, Dr. Roy R. Kracke, dean, Medical College of Alabama, Birmingham, made available a complete list of faculty appointments for the new school. Included in the list appear the following:

Department of anatomy: Dr. Charles M. Goss, professor and chairman; James O. Foley, Ph.D., and Thomas E. Hunt, Ph.D., associate professors.

## ILLINOIS

**Special Society Election.**—On May 4, Dr. Joseph A. Luhan, Chicago, was elected president of the Illinois Psychiatric Society. Other officers include Dr. Delmar Goode, Downey, and Dr. Charlotte G. Babcock, Chicago, secretary-treasurer.

**Personal.**—Dr. Douglas Boyd has been appointed president of the Highland Park Board of Health, succeeding Dr. Donald E. Rossiter, Highland Park, who resigned effective April 1. Dr. Rossiter had held the position since 1931, except while on military leave.

**Cook County First to Place Milk Control in Health Department.**—Cook County is said to be the first county in Illinois to pass an ordinance regulating the handling, labeling, sale and distribution of milk and milk products. The ordinance provides that only pasteurized milk and milk products are to be sold within the area of jurisdiction of the health department and gives the county health department the responsibility to enforce it. The county health department, of which Dr. Edward A. Piszczek, Chicago, is director, has just made available a report covering health activities for the period 1941-1945. The report presents graphically the service of the department to the suburbs and Cook County. The first organized public health work in this area was begun on July 1, 1940, when the Cook County Public Health Unit was established in the Bureau of Public Welfare as a cooperative agency of the board of commissioners, Illinois Department of Public Health, and U. S. Public Health Service. On Dec. 10, 1945 the board of commissioners reorganized the unit and established the Cook County Department of Public Health to serve all of Cook County except Chicago, Evanston and Winnetka-Kenilworth. The health department extends its services to more than 600,000 people in an area of 735 square miles.

### Chicago

**Personal.**—Dr. Louis B. Shapiro, recently released from military service, has been appointed clinical director of the Chicago State Hospital.

**John Mote Joins Armour Laboratories.**—Dr. John R. Mote, formerly associate director of research at the House of the Good Samaritan, Boston, and assistant in the department of preventive medicine, Harvard Medical School, Boston, has been appointed medical director of the pharmaceutical division of the Armour Laboratories. Dr. Mote graduated at Harvard Medical School in 1935 and went to London in 1940 as liaison officer to assist in setting up the Harvard-American Red Cross Hospital. While in London he was medical adviser to the American Red Cross and American liaison officer in the Ministry of Health. When he returned to the United States in 1941 he enlisted in the United States Naval Reserve and at the request of the British Supply Council became medical director of the British Supply Mission.

**Statue of Apollo Unveiled.**—A statue of Apollo, commemorating the founding of the first chapter of Alpha Omega Alpha, national honorary medical fraternity, on the Chicago campus of the University of Illinois in 1902, was unveiled in ceremonies at the University of Illinois College of Medicine June 5. The statue is situated between the archway of the Medical, Dental and Pharmacy Building, 1853 West Polk Street, and the entrance to the Research and Educational Hospitals of the university. Speakers at the unveiling ceremony included Dr. Walter L. Bierring, Des Moines, Iowa, national president of Alpha Omega Alpha; Dr. Josiah J. Moore, national secretary-treasurer of the group, Dr. Raymond B. Allen, executive dean of the Chicago colleges and Dr. David J. Davis, dean emeritus of the college of medicine. Dr. Warren H. Cole, was master of ceremonies. The statue was financed by alumni and members of the local chapter and the national organization of Alpha Omega Alpha. Mrs. Olga Chassaing, the artist who made the original model for the statue, died in 1943. Her husband, George Chassaing, also an artist, completed her work.

**Physicians and Lawyers Cooperate in Medical Testimony.**—The Chicago and Illinois Bar Associations joined with the Chicago Medical Society to correct abuses arising from inexpert medical testimony in civil and criminal courts, the Chicago *Daily News* reported May 20. They have announced adoption of the Minnesota Plan and sent copies of it to all judges and hearing officials. Under the plan, when questionable testimony is offered, the judge, lawyer or physician should write a letter to the medical society giving the name of the medical witness, the name and number of the case and where and when it was tried. A committee of the medical group will, at its own expense and with the aid of the bar association, obtain a transcript of the record, and, if need be, call in

specialists in the field of medicine involved If the committee finds that the medical witness testified falsely or lacked knowledge of the subject and his testimony disregarded the truth proper disciplinary action will be taken before the Illinois Department of Registration and Education Likewise judges and other parties taking part in such cases will write a similar letter to the appropriate bar group if there is reason to believe that the attorney using such testimony did so knowing its falsity or lack of qualification of the witness

## KENTUCKY

**Health Center Named for Physician.**—The new Paducah-McCracken County Health Center has been named the Van A Stilley Clinic after Van A Stilley, who did so much to promote public health improvement in West Kentucky according to Paducah newspapers, April 19 Dr Stilley died in 1944 while president of the Kentucky State Medical Association He served many years as field director in the Paducah area in the state department of health The health center, which cost about $83 000 was built by the city and county in cooperation with the federal government

**National Research Council Fellows**—Winners of the National Research Council fellowships awarded under a grant of $100,000 from the National Foundation for Infantile Paralysis have been announced. Of the ten winners nine are physicians including one woman, and one is to receive his Ph D in June The fellows will conduct their studies in nine different states and Melbourne, Australia, with allowances ranging from $2,220 to $6 000 a year The fellows are

Dr Charles L. Wilson Montreal Canada who will study orthopedic surgery in the department of surgery, Washington University School of Medicine St Louis
Dr Margaret H D Smith Baltimore who will do virus research at the Rockefeller Institute Princeton N J
Bernard A Briody Jr New Haven Conn who will study the interference phenomenon' in viruses at the Walter and Eliza Hall Institute of Research Melbourne, Australia
Dr Peter L Beal Chicago who will investigate immunology of the lymphogranuloma venereum psittacosis group of virus at the Virus Research Laboratory California State Department of Health Berkeley
Dr Robert H Green Charleston S C who will study vaccinia and neurotropic viruses at the Rockefeller Institute for Medical Research, New York
Dr Thomas Gucker III Boston who will make a study of the circulation to the bone and the musculature in normal and paralytic extremities and the relation of circulatory changes to the inhibition of growth at Children's Hospital Boston
Dr John H Heinen, Chicago who will study 'mechanism of action of parathormone in the department of physiology University of Chicago
Dr Louis J Strobino Bethel Conn who will study determination of normal bone protein in various age groups and in pathologic conditions at the Alfred I du Pont Institute of the Nemours Foundation Wilmington, Del.
Dr Edward L Pratt Boston who will study alterations in electrolytes and body fluids occurring in several conditions, particularly dehydration and acidosis at Yale University School of Medicine New Haven Conn
Dr John R Neefe, Jersey Shore Pa who will study infectious hepatitis at the hospital of the University of Pennsylvania Philadelphia

**Medical Events in San Francisco**—The 1946 session of the Society for Investigative Dermatology will be held at the Hotel Whitcomb, San Francisco June 30 Dr Henry E. Michelson Minneapolis will deliver the presidential address on The History of Lupus Vulgaris ——In addition to a series of scientific papers features of the American Proctologic Society s meeting at the Bellevue Hotel June 28-30 will include a review of the literature of 1944 to 1946 by Drs Raymond J Jackman, Rochester Minn on Benign Diseases of the Colon and Rectum and Francis D Wolfe, Chicago on 'Malignancy of the Colon and Rectum. There will also be a symposium on pilonidal disease by Drs. Theodore F Reuther Chicago Emil Granet and Douglass Palmer both of New York, and Karl Zimmerman Pittsburgh——Sir Stewart Duke Elder London, England as guest of honor will discuss Ophthalmology During the War and in the Future at the eighty-second meeting of the American Ophthalmological Society at the Hotel Mark Hopkins June 26-28——The annual banquet of the American Society of Clinical Pathologists meeting at the Palace Hotel June 28-30 will be addressed by Dr George Dock Pasadena Calif on Clinical Pathology in the Eighteen-Eighties" The Ward Burdick Medal will be presented to Dr Philip Levine Linden N J for his contribution on 'The Present Status of the Rh Factor ——Included among the speakers at the annual meeting of the American Academy of Tuberculosis Physicians in the Palace Hotel June 30 will be Dr Hamilton H. Anderson, San Francisco on 'Antibiotics in Experimental Tuberculosis' Dr Harry J Corper and R E Stoner Denver "An Improved Procedure for the Diagnostic Culture of Mammalian Tubercle Bacilli,' and Marcio M Bueno Rio de Janeiro Brazil "Anatomic Concepts Regarding Pathologic Aspects of Lymph Nodes and Lungs ——International Night will be a feature of the 1946 session of the American College of Chest Physicians at the Hotel Sir Francis Drake June 27-30 Participants will include Drs Donato G Alarcon, Mexico City William E Ogden Toronto Peter A. Theodos Athens Greece David P Marais South Africa Cape Town Shu Fan Li Hong Kong China Miguel Jiminez Mexico City Paulo Seabra Rio de Janeiro and Manuel Quisumbing San Pablo Philippine Islands——Dr Frederick W O Brien Boston will deliver the Janeway Lecture of the American Radium Society during its 1946 session at the Assembly Hall Health Center June 28 29 his subject will be "Radium Treatment of Cancer of the Cervix A Historical Review ——Among the speakers before the American Neurological Association at the Fairmont, June 26-28 will be Drs Howard D J Fabing Cincinnati on Cerebral Blast Syndrome in Combat Soldiers Edward B Schlesinger Rochester Minn 'Clinical Application of Curare Derivatives and Bernhard Dattner New York and Samuel S Kaufman Washington D C Penicillin Treatment in Neurosyphilis"——Dr Robert Doerr professor emeritus of hygiene and bacteriology University of Basel Switzerland will be guest of honor during the meeting of the American College of Allergists at the Clift Hotel June 28 30 His subject will be Integration and Differentiation of Allergic Phenomena"——The Association of Allergists for Mycological Investigation will hold an evening session at the Clift Hotel June 28 the program to be a symposium on mold allergy ——An afternoon session June 28 at the Clift Hotel will be given over to a Pan American Congress on Allergy and meeting of the International Association of Allergists——Fellows of the International College of Surgeons and their wives are invited to a luncheon and drive through the countryside to St. Gothards Tavern in St. Helena, Napa County July 4 transportation will be furnished by the San Francisco and Los Angeles Guilds of the International College of Surgeons Additional information may be obtained from Dr Felix Cunha 450 Sutter Avenue San Francisco——The American Medical Women s Association will meet at the Canterbury Hotel, June 28-July 1 this session to be more of a social nature.

## CORRECTION

**Rabies in Ecuador**—A news item in THE JOURNAL April 6 page 959 reported that 400 human beings were reported to have died of rabies in Quito Ecuador This total should have been 4, according to the source of the news item. A subsequent report received from Dr Hugh S Cumming Washington, director of the Pan American Sanitary Bureau indicated that the total figures for rabies during the years 1944 1945 and 1946 up to May 15 show 222 persons bitten, 145 persons treated and 10 deaths

# Government Services

### Inter-American Affairs Transferred to State Department

On April 10 an executive order was signed transferring corporations of the Office of Inter-American Affairs to the Department of State effective May 20 According to the *Newsletter* of the Health and Sanitation Division, Institute of Inter-American Affairs field operations and future programs will not be affected by the transfer A statement by President Truman indicated that the executive order terminates the Office of Inter-American Affairs and places those of its functions involving continued cooperation with the other American republics in a regular department of the United States government.

### Fellowships Available

The National Foundation for Infantile Paralysis has approved a grant to the U S Public Health Service for establishment of one hundred and twenty-five fellowships to train physicians and sanitary engineers in public health. Each fellowship provides a year s graduate training in a school of public health or a school of sanitary engineering The fellowships will be administered by the committee on training of public health personnel which consists of representatives of schools of public health the state and territorial health officers the American Public Health Association and the U S Public Health Service. The fellowships are available during the academic year beginning either in the fall of 1946 or in the fall of 1947 and are open to men and women citizens of the United States under 45 years of age Applicants for fellowships may secure details by writing to the Surgeon General, U S Public Health Service attention Public Health Training 19th and Constitution Avenue N W Washington D C Owing to the anticipated heavy enrolment in graduate schools completed applications for training in the fall term of 1946 should be filed promptly The awards committee will act on applications on June 15 July 1 July 15 and August 1

### Grants for Cancer Research

The National Advisory Cancer Council of the U S Public Health Service has approved thirteen federal grants-in-aid for cancer research totaling $149,430 Applications for research funds were reviewed at the quarterly meeting of the council March 29 at the National Cancer Institute, National Institute of Health, of the U S Public Health Service Bethesda Md. Established by Congress in 1937 the National Advisory Council advises the Surgeon General on all matters pertaining to the control of cancer and makes recommendations to him for granting of federal funds for research The following projects were approved at the last meeting Roscoe B Jackson Memorial Laboratory Bar Harbor Maine, Biologic Studies on Neoplasia in Mice," Clarence C Little Sc.D director $29 450 Barnard Free Skin and Cancer Hospital St. Louis "Integration of Changes in Experimental Carcinogenesis" Edmund V Cowdry Ph D director $25 000 Harvard University Cambridge, Mass Chemotherapy of Cancer Experimental and Clinical" Dr Arnold M Seligman Brookline director $18 000 Michael Reese Hospital Chicago The Role of Nutrition in the Origin and Growth of Tumors Dr Albert Tannenbaum director $10 000 Children s Hospital Boston, for the establishment of a consultation service to provide assistance in diagnosis and treatment of tumors of infancy and childhood and a study of the clinical pathologic and epidemiologic aspects of tumors of early life, Dr Sidney Farber director, $10 000 St Vincent s Hospital New York, 'Etiology and Treatment of Hodgkin s Disease," Robert Chambers Ph D, and Dr Antonio Rottino directors $10 000 New York University New York Tissue Culture Studies on the Etiology of Hodgkin s Disease and the Effect of Cell Free Filtrates on the Explanted Growths" Dr Chambers, director $10 000, Cornell University Medical College, New York, Studies on Ovarian Tumors, Dr Jacob Furth, director $9 480 Michigan State College, East Lansing Mich "Serologic Studies of Avian Lymphomatosis and Related Manifestations Ben R. Burmester Ph.D director $3 000 Institute for Cancer Research, Lankenau Hospital Philadelphia. "Effect of Trypanosome Endotoxins on Tumor Growth, Theodore S Hauschka director $2 500 University of Minnesota, Minneapolis Induction of Leukemia and Mammary Cancer in Mice Arthur Kirschbaum, Ph D director $2 000

# Deaths

**Walter Steen Jensen** ⊕ Colonel M C, U S Army, Washington, D C born in Brooklyn on Aug. 11, 1894 served with the Rainbow Division during World War I and received the Purple Heart and an Oak Leaf Cluster for meritorious service College of the Medical Evangelists Los Angeles 1924, entered the medical corps of the U S Army as a first lieutenant in 1925 rose through the various grades to that of colonel Army Medical School and the Medical Field Service School in 1929 School for Aviation Medicine Randolph Field, Texas in 1933 and later appointed on the faculty as director of neuropsychiatry served as executive and consultant at the Army and Navy General Hospital in Hot Springs National Park, Ark. during the spring of 1941 was medical director of the Newfoundland Base Command, St Johns, and supervised health activities of all army projects in that vicinity, formerly liaison officer to Newfoundland health authorities, in March 1942 was assigned to the air surgeon's office as deputy air surgeon of the Army Air Forces and in 1944 assigned to important post overseas, awarded the Legion of Merit for 'exceptionally meritorious conduct in the performance of outstanding services from July 31, 1941 until Oct. 5 1942 member of the American Psychiatric Association, Aero Medical Association of the United States and the Association of Military Surgeons of the United States fellow of the American College of Physicians, died April 4, aged 51

**Rollin Howard Stevens** ⊕ Detroit, University of Michigan Homeopathic Medical School, Ann Arbor, 1889, born in Blenheim Ont Canada, Jan 7 1868 an Affiliate Fellow of the American Medical Association founder of the Michigan Society of Social Hygiene of which he had been president member and past president of the Radiological Society of North America, American Association for the Study of Neoplastic Diseases of which he had been vice president, American Radium Society, Detroit Roentgen Ray and Radium Society, Detroit Dermatological Society and the American College of Radiology, member of the American Roentgen Ray Society American Cancer Society British Institute of Radiology and the American Academy of Dermatology and Syphilology fellow of the American College of Physicians specialist certified by the American Board of Radiology Inc at one time lecturer on dermatology at his alma mater and associate clinical professor of dermatology and syphilology and assistant clinical professor of roentgenology at the Detroit College of Medicine and Surgery for many years affiliated with the Grace Hospital, consulting radiologist to the Eloise Hospital Eloise, director and secretary of the Radiological Research Institute the January 1938 issue of *Radiology* was dedicated to him, died in the Grace Hospital May 16 aged 78.

**Cassius D Wescott**, Chicago Rush Medical College Chicago 1883 born in Salisbury Center N Y, May 25 1861 member of the American Medical Association, serving as chairman of its Section on Ophthalmology 1918-1919 and member of the House of Delegates from 1922 to 1925, member and past president of the American Ophthalmological Society Chicago Ophthalmological Society Institute of Medicine of Chicago and the Chicago Pathological Society fellow of the American College of Surgeons member of the American Association of Railway Surgeons and the Chicago Milwaukee and St. Paul Railway Surgeons Association specialist certified by the American Board of Ophthalmology, commissioned a first lieutenant in the medical reserve corps in 1911, formerly instructor and assistant professor of ophthalmology at his alma mater at various times on the staffs of the Eastern Hospital for the Insane Kankakee, Ill Illinois Charitable Eye and Ear Infirmary Central Free Dispensary Washington Boulevard, Presbyterian, Cook County St. Luke's and St. Anthony's hospitals lecturer on the eye at the Illinois Training School for Nurses from 1891 to 1915 died in the Wesley Memorial Hospital May 6 aged 84, of bronchopneumonia and fracture of the left hip incurred in a fall.

**Welch England**, Parkersburg, W Va. University of Maryland School of Medicine and College of Physicians and Surgeons, Baltimore, 1926 born in Lindside, W. Va., Feb. 19 1902 specialist certified by the American Board of Otolaryngology member of the American Medical Association, American Academy of Ophthalmology and Otolaryngology, Southeastern Surgical Congress and the Association of Military Surgeons of the United States, served as a member president and secretary of the Academy of Medicine of Parkersburg, fellow of the American College of Surgeons formerly councilor of the Fourth District of the West Virginia State Medical Association, on the staff of the Camden-Clark Memorial Hospital in 1942 commissioned in the medical corps of the Army of the United States, serving until late in 1945 when he was honorably discharged with the rank of lieutenant colonel died April 29 aged 44 of heart disease.

**William Nicolas Boldyreff**, Battle Creek, Mich, Imperial Medical Academy, St. Petersburg, Russia, 1898 born in Vononezh, Russia, Jan. 10 1873 associate professor at his alma mater from 1902 to 1912 professor of anatomy and public health at the Imperial Lyceum in St. Petersburg 1911-1912, and toxicology and pharmacology at Kazan University from 1912 to 1918, lecturer at the Japanese universities in 1920 and 1921, in 1922 associate physiologist at Western Reserve University in Cleveland received the Pokrovsky prize in 1903 Pavlov prize in 1906 and the International Hygienic Exhibition prize at Dresden in 1911 honorary member of the Esthonian Medical Society and the International Society of Medical Hydrology; served as director of the Pavlov physiological institute of the Battle Creek Sanitarium principal research devoted to physiology of digestive system, died February 27, aged 73 of carcinoma of the liver

**Henry Nathan Blum** ⊕ New Orleans, Medical Department of Tulane University of Louisiana New Orleans 1900 born in 1876; specialist certified by the American Board of Ophthalmology, member of the American Academy of Ophthalmology and Otolaryngology fellow of the American College of Surgeons formerly professor of ophthalmology at the Louisiana State University School of Medicine assistant professor of ophthalmology at his alma mater and assistant professor and associate professor of ophthalmology at the Tulane University Graduate School of Medicine, served at various times and in various capacities on the staffs of the Charity Hospital, Flint-Goodridge Hospital and the Touro Infirmary, where he died April 13, aged 69 of cerebral hemorrhage

**Perry L Boyer** ⊕ Colonel, U S Army retired Alexandria, Va University of Maryland School of Medicine Baltimore, 1899, Army Medical School, 1902, entered the medical corps of the U S Army in 1901 served in France and Germany with the first division American Expeditionary Forces during World War I his last command was at the army hospital in Jefferson Barracks Mo; retired Feb 29 1936 for disability in line of duty; member of the Military Order of the Carabao and the Association of Military Surgeons of the United States died in the Walter Reed General Hospital Washington, D C, April 17, aged 68, of right paranephric abscess.

**James Herbert Young** ⊕ Newton Mass Harvard Medical School, Boston 1906, born in Amesburg Mass., May 31 1882 specialist certified by the American Board of Pediatrics member of the American Academy of Pediatrics and the New England Pediatric Society, for many years assistant in pediatrics at his alma mater served as consultant in pediatrics at the Massachusetts Eye and Ear Infirmary and New England Baptist Hospital physician to children's medical service, Massachusetts General Hospital and physician and chief of the department of pediatrics Cambridge Hospital, died February 18 aged 63 of cerebral thrombosis

**William James Cochrane** ⊕ Lake City Minn., College of Physicians and Surgeons of Chicago 1895 an Affiliate Fellow of the American Medical Association past president of the Wabasha County Medical Society chairman of the bicounty tuberculosis commission a captain in the medical corps of the U S Army during World War I, served as health officer president of the board of the Lake City Hospital and local surgeon for the Chicago Milwaukee and St Paul Railroad president of the Lake City Bank and Trust Company; died February 1, aged 78, of generalized carcinomatosis

**Burr Ferguson**, Birmingham, Ala. Columbia University College of Physicians and Surgeons New York 1896 born in Montgomery Ala Dec 21 1872 member of the American Medical Association, at one time medical officer for the Tennessee Coal and Iron Company served during World War I and later with the Red Cross in Siberia and Albania and the U S. Public Health Service in The Netherlands and England author of "Facts of Phagocytes" died in the Veterans Administration Facility Tuscaloosa, April 3, aged 73 of cerebral thrombosis

**Frank Augustus Brockmyre**, Canandaigua, N Y; the Hahnemann Medical College and Hospital, Chicago, 1901 member of the American Medical Association; on the staff of the Frederick Ferris Thompson Hospital where he died February 7 aged 68, of cardiovascular renal disease

**Raymond Gilbert Bugbee** ⊕ Providence R I, McGill University Faculty of Medicine, Montreal, Que, Canada, 1909, fellow of the American College of Surgeons, physician and surgeon on the staff of the Andrews House, Brown University where he had been for many years athletic surgeon; affiliated with the Rhode Island Hospital and the Providence Lying-In Hospital died February 3 aged 63, of coronary thrombosis

**George Theophilus Bynoe** ⊕ Brooklyn, Howard University College of Medicine Washington D C, 1911 died in the Brooklyn Hospital February 13 aged 62 of chronic myocarditis

**Hugh Angus Cameron,** Detroit Hahnemann Medical College and Hospital of Philadelphia 1896, University of Michigan Homeopathic Medical School, Ann Arbor 1921, died February 5 aged 76 of cerebral hemorrhage.

**George Kirwin Campbell,** Kansas City Mo George Washington University School of Medicine, Washington D C, 1930 member of the American Medical Association specialist certified by the American Board of Orthopaedic Surgery Inc. died in the Research Hospital February 7 aged 41, of cerebral hemorrhage

**William Arthur Cave,** Torrance Pa University of Pittsburgh School of Medicine 1909 member of the American Medical Association and the American Urological Association, served during World War I on the staff of the Torrance State Hospital died February 11, aged 62 of tuberculosis of the colon

**Earl Gaines Conn** ⊕ Chrisman Ill Bennett Medical College Chicago 1914 for many years president of the local high school director of the First National Bank died in St Elizabeth Hospital, Danville February 8 aged 62 of cerebral hemorrhage

**Eugene Crandle,** Gorham Ill St Louis College of Physicians and Surgeons 1904 member of the American Medical Association died in the Holden Hospital Carbondale February 1, aged 78 of coronary occlusion

**Holt Darden,** Blakely Ga Emory University School of Medicine, Atlanta 1925, died January 30 aged 46 of accidental suffocation

**Daniel William Davis** ⊕ Akron Ohio Starling Medical College Columbus 1895 served during World War I, died in the City Hospital February 5, aged 79 of bronchopneumonia

**Arleigh Clinton Delaplane** ⊕ Cincinnati Baltimore Medical College 1902 served in the medical department of the Pennsylvania Railroad for forty years died February 13 aged 66 of a coronary thrombosis

**Charles Magna Driver,** Mounds Okla University of Louisville (Ky) Medical Department 1898 served during World War I died in the Veterans Administration Facility Muskogee February 5 aged 76 of cerebral hemorrhage

**Charles Alvie Everett** Brookhaven Miss, University of Louisville (Ky) Medical Department, 1910, member of the American Medical Association served as superintendent of the Natchez Charity Hospital in Natchez and the South Mississippi Charity Hospital in Laurel died in McComb, February 8 aged 62 of coronary occlusion

**Ulysses S Grant Ferrell,** Cairo W Va Baltimore University School of Medicine 1893 died February 2 aged 80 of coronary thrombosis

**Charles Joseph Valentine Fries Jr** ⊕ Philadelphia Hahnemann Medical College and Hospital Philadelphia, 1912 also a graduate in pharmacy, clinical professor of ophthalmology at his alma mater, where he had been head of the department interned at the Pittsburgh Homeopathic Medical and Surgical Hospital a lieutenant in the medical corps of the U S Navy during World War I on the staffs of the Hahnemann and Women's Homeopathic hospitals died in Wynnewood May 7 aged 55, of coronary thrombosis

**Heraclio Gonzalez,** San Antonio Texas Escuela de Medicina de Nuevo Leon Monterrey Mexico 1901, died February 1, aged 66 of coronary occlusion

**Adelbert Louis Gramsch** ⊕ Ridgewood N J New York Homeopathic Medical College and Flower Hospital New York 1910 member of the American College of Chest Physicians acting superintendent of the Bergen Pines, Bergen County Hospital formerly superintendent of the Southern Pines Sanatorium in Southern Pines N C at one time affiliated with the New Jersey Sanatorium for Tuberculosis Diseases in Glen Gardner, died in the Hackensack (N J) Hospital February 2 aged 62 of carcinoma of the tongue

**Andrew Jackson Harness,** Miami, Fla Kentucky University Medical Department Louisville, 1904 member of the American Medical Association, served during World War I, died January 30 aged 62, of cancer of the lung

**Edward Voriece Jacobs,** Meridian, Calif, Missouri Medical College St Louis, 1884, died January 12, aged 84 of cerebral hemorrhage and pneumonia

**B F McClure,** Jackson, Ky (licensed in Kentucky in 1894), died February 1 aged 98, of arteriosclerosis

**Robert Shelmerdine McCombs,** Philadelphia, University of Pennsylvania Department of Medicine, Philadelphia, 1901, served during World War I, on the staff of the Children's Hospital author of "Diseases of Children for Nurses", died in the Pennsylvania Hospital February 9, aged 65, of coronary thrombosis

**Charles Franklin Magee,** Moscow, Idaho, McGill University Faculty of Medicine, Montreal, Que, Canada, 1903, served in the medical corps of the Canadian army during World War I, died February 11, aged 71, of influenza and cardiovascular renal disease.

**Henry Hudson Merrell,** Chicago, National Medical College *Chicago 1896 member of the American Medical Association* served during World War I for many years on the staff of the Garfield Park Hospital died February 7, aged 80 of coronary occlusion

**Allen Hart Miller,** Millville, Fla, Georgia College of Eclectic Medicine and Surgery Atlanta, 1895, member of the American Medical Association died in Gulfport January 20 aged 77 of chronic nephritis

**Alanson Filer Bort Morris** ⊕ Pittsburgh, Western Pennsylvania Medical College, Pittsburgh, 1896, served during World War I lieutenant colonel, medical reserve corps, U S Army not on active duty died in the St Stephens School February 6 aged 77, of coronary occlusion

**Harry Thomas Morton,** Kansas City, Mo, University Medical College of Kansas City 1909 served during World War I, died in the Veterans Administration Facility, Wadsworth Kan, February 1, aged 67, of carcinoma of the prostate

**Epaphroditus J Porter,** Grand Island Neb Rush Medical College Chicago 1878 died February 4 aged 91, as the result of fractured hip received in a fall and heart disease.

**Walter Clemens Raymond** ⊕ Johnstown Pa Jefferson Medical College of Philadelphia 1906 specialist certified by the American Board of Obstetrics and Gynecology in 1935 president of the Cambria County Medical Society charter member of the Pittsburgh Obstetrical Society, for many years staff obstetrician at the Mercy Hospital were he died February 6 aged 68, of liposarcoma of the pancreas

**Robert Lemuel Sellers,** Westville, Okla Memphis (Tenn) Hospital Medical College, 1892, Hospital College of Medicine Louisville Ky, 1897, also a druggist died January 29 aged 80 of cerebral hemorrhage

**John Holt Sewell** ⊕ Fort Worth Texas, Johns Hopkins University School of Medicine Baltimore 1914, associated with the W I Cook Memorial Hospital died January 9, aged 60 of coronary occlusion

**Stanley Edwin Sitko,** Detroit Indiana University School of Medicine Indianapolis 1925 died in the Highland Park (Mich) General Hospital February 7 aged 54, of cerebral hemorrhage hypertension and cerebral sclerosis

**George B Swenson,** Baldwin Wis University of Minnesota College of Medicine and Surgery Minneapolis 1900 member of the American Medical Association died in Madison January 30, aged 67 of perforated duodenal ulcer

**Walter L Vercoe,** Hot Springs, S D, Chicago Physio-Medical College 1891 Harvey Medical College, Chicago, 1898 specialist certified by the American Board of Ophthalmology fellow of the American College of Surgeons, died in Deadwood January 30 aged 84 of lobar pneumonia

**Frank Peter Jacob Was** Chicago Rush Medical College, Chicago 1905 member of the American Medical Association on the associate staff of the Roseland Community Hospital where he died April 18 aged 67 of coronary thrombosis

**J Warren Whisenant,** Duncan Okla, Kentucky School of Medicine, Louisville 1891, died January 24 aged 76 of coronary occlusion

**Scudder Johnson Woolley** ⊕ New York, University of Pennsylvania Department of Medicine Philadelphia 1895, also a graduate in pharmacy on the consulting staff of the *Monmouth* Memorial Hospital Long Branch, N J and Fitkin Hospital Asbury Park, N J, died January 19, aged 75 of heart disease

### Improved Medical Services for Industry

Important recommendations for the better training of medical officers nurses and others concerned with matters of health in industry are contained in a report of the education committee of the Association of Industrial Medical Officers The present facilities for the training of medical students are described as extremely scanty In the future all students should be trained to recognize that the daily occupation of a patient, the economic effect of illness and the necessity for the restoration of earning capacity are all important aspects of everyday practice. Students should also receive special training as regards accident surgery, attend lectures on occupational medicine and spend at least three days in a factory where they can learn about the normal work of the industrial medical officer All teaching hospitals should have on the staff or available to them an industrial medical officer to undertake undergraduate instruction

For postgraduates who intend to devote themselves more especially to industrial medicine a broad basic training in general medicine followed by special training of three types is recommended for the consultant and specialist in industrial medicine, for the whole time industrial medical officer or for certain special appointments, such as examining surgeons or factory medical inspectors The committee also recommends the institution of a Diploma in Industrial Health

Training of nonmedical personnel is also advocated Nurses should receive special instruction whole time or part time to fit them for the important part they play in any industrial health plan The almoner should have a wider training in industrial subjects since she is the most important link between hospital and industry General education in health matters for the staff and workers in industry—the works manager technicians, foremen workers themselves and especially the personnel manager —is also advocated so that all can play an intelligent part in preventing accidents and disease.

### Britain Reduces Food Supply

Further cuts in the food allowance of the British people and further darkening of their bread in order to increase the food supply of the starving peoples were announced by the minister of food The allocations of sugar and fats for flour and confectionery and cakes will be reduced by 25 per cent in order to secure a reduction in the consumption of flour for cakes The extraction rate of flour which was on March 10 increased to 85 per cent, compared with 73 per cent prewar is to be raised as a temporary measure to 90 per cent This will involve a darkening of the loaf unknown since the period of stone ground flour before the introduction of the steel mill It will also involve a considerable reduction in feed for animals which was available in the production of white flour It is hoped that these drastic steps will enable the most stringent period between now and the gathering of the next harvest of the world to be bridged over It is estimated that the saving in fats and sugar will amount to about 40 000 tons a year The increased extraction rate will continue for a period depending on the wheat supply of the country and will mean a loss of 300 000 tons of feed Another step taken by the government is the reduction in the weight of the 2 pound loaf by 4 ounces which will be sold at the same price as the ordinary loaf was The object is to make people more economical in the use of bread.

### Australian Scientists in England and America

Brigadier N H Fairley, specialist in tropical diseases and director of medicine in the Australian army, is leaving by air for England on an Australian army mission When his task is completed he will accept two important appointments—director of tropical research at the Wellcome Research Foundation and professor at the School of Hygiene and Tropical Medicine

Another scientist lost to Australia is Dr H C Corben, who has been appointed associate professor of theoretical physics at the Carnegie Institute, Pittsburgh

## TURKEY

*(From Our Regular Correspondent)*

ANKARA, April 29, 1946

### Obligatory Government Service

In 1923, when Turkey became a republic there were at the disposal of the Ministry of Health and Social Assistance 554 physicians, 61 pharmacists, 563 sanitary inspectors, 136 midwives and 4 hospital nurses Because most departments were insufficiently staffed and especially the eastern provinces were then practically without such elements, it has been the first concern of the Ministry of Health to increase the number of physicians and require several years of service of every new graduate The country's unfavorable condition accounted for the reluctance of desirable students to enter the medical profession, which required six years' training To remedy the situation the Ministry of Health opened a dormitory in 1924 in Istanbul for 300 students, who were supplied with free board and maintenance, every article of clothing and other necessities, all textbooks and a monthly allowance On graduation these students were required to give to the Ministry of Health four years of service the locality of which the graduates determined by drawing lots for vacancies New dormitories were added each year and at present 985 students are living in fourteen buildings

Graduates who studied at their own expense were required to give one to two years' service but since 1933 the latter have no longer been called on for compulsory service

The government is considering new plans to supply an adequate number of physicians The time of compulsory service of graduates who studied at government expense may be lengthened to six years or more. The number of dormitory students releasing themselves from compulsory service by refunding to the government expenses incurred during their training has recently increased thus defeating the purpose of providing a free medical education It is expected that the 200 student dormitory at the Ankara Medical School to which accommodations for 800 more students are to be added within the next three years, will take care of the vacancies the Ministry of Health has to fill

### Increased Budget for Ministry of Health

In 1923 the first year of the republican government, the health and social assistance budget was 920 000 Turkish pounds In successive years the budget was gradually increased until in 1946 it reached 32 723 400 pounds or 3 3 per cent of the whole government budget. Most of the expenditures of the Ministry of Health are allocated for preventive medicine, mainly control of malaria syphilis and trachoma and the work at the Central Institute of Hygiene The salaries of the more than 2,000 physicians, pharmacists, chemists and more than 3,000 sanitary inspectors, midwives and hospital nurses in various government hospitals take up a considerable amount of the budget For twenty-two years the fiscal year began in June but a new law has changed this to January The chief reason for this change was that allocations and projects, contracts for new construction equipment, repair work and the draining of swamps had to be considerably increased and to be drawn up during the first three months of the year, so that the work could go into

full operation in spring and summer. In recent years the government has concentrated on education and health. The allocation to the Ministry of National Education is 10.2 per cent of the general budget.

## PUERTO RICO

SAN JUAN, May 1, 1946

### Health Program in Puerto Rico

Dr. Antonio Fernos Isern, commissioner of health of Puerto Rico, has outlined the public health program that is being carried out in this island, in a statement issued by him March 30 indicating that the general mortality rate has decreased as follows. The average mortality rate from 1931 to 1941 inclusive for each thousand inhabitants was 19.8. In 1942 it decreased to 16.6, in 1943 to 14.7, in 1944 to 14.8 and in 1945 to 14.1. The infant mortality rate in Puerto Rico from 1931 to 1941 inclusive (death of children of 1 year of age for each thousand births) was 123.5. It was 103.4 in 1942, 95.3 in 1943, 99.5 in 1944 and 88.3 in 1945.

The Department of Health carries out a malaria control program for which the following appropriations will be available during the fiscal year 1946-1947: general budget appropriations $382,000, special legislation $100,000 and emergency program activities $200,000, making a total of $682,000 for this program. The mortality rate for malaria cases during 1931 to 1941 inclusive was 140.7 per hundred thousand inhabitants. In 1942 it was reduced to 99.4, in 1943 to 58.9, in 1944 to 49.9 and in 1945 to the lowest figure of 42.5. A tuberculosis bureau is maintained by this department with modern equipment and under the direction of competent specialists. A diagnostic clinic is maintained in each town, there are eighteen ambulatory treatment centers, the bureau has 1,500 beds available for tuberculous patients. As a result the average mortality rate for tuberculosis during the years 1931 to 1941 inclusive was 286.5 per hundred thousand inhabitants but this dropped to 244.5 in 1942, to 231.1 in 1943, to 215.4 in 1944 and to 200.4 in 1945, the lowest rate ever registered. Plans are now under way to increase in one year 50 per cent of the available hospital facilities for treatment of the tuberculous according to legislation passed by the insular legislature.

The mortality rate for other contagious diseases has dropped considerably as a result of the intensification of health measures and sanitation.

### Discharge of Army Physicians Who Accept Contracts in Puerto Rico

At the request of Dr. Antonio Fernos Isern, health commissioner of Puerto Rico, the military authorities are willing to discharge from the armed forces physicians who may accept contracts to work in the Department of Health of Puerto Rico. This was revealed in a letter sent by Dr. Fernós Isern to the Public Service Commission asking authorization to make appointments of qualified physicians under a provisional plan, without the necessary requisite of 'specialization and experience." The Public Service Commission immediately authorized the commissioner of health to extend the necessary appointments during the period of emergency for lack of physicians in Puerto Rico to cover vacancies now existing in the Department of Health of the island without the requisites of "specialization and experience." This authorization, however, will automatically cease as soon as the commission verifies that a certain number of eligible physicians are available in the list of the commission who meet the necessary qualifications of experience and specializations, according to the rules and regulations of the commission.

A recent law approved by the governor authorizes the commissioner of health to contract for the services of American and foreign physicians to work in Puerto Rico. This law is now effective and will be in force until the year 1950.

### Blue Cross Plan in Puerto Rico

Governor Tugwell has approved an act passed by the insular legislature to provide medical and hospitalization services to the officials and employees of the insular government of Puerto Rico through the so-called Blue Cross Plan. The sum of $200,000 is appropriated by this act to cover 50 per cent of the cost of the service. The law authorizes the heads of departments and dependencies of the government to deduct from vouchers of salaries of officials and employees availing themselves of the services 50 per cent of the cost of the project.

### Uterine and Vaginal Changes in Vitamin E Deficiency

Dr. J. Lopes de Faria of the Department of Pathology of the University of São Paulo has just published the report of an investigation planned to detect possible alterations in the uterus and the vagina of animals with E avitaminosis. The investigation over a period of seventeen months included 26 rats, 17 deficient in vitamin E and 9 as controls. The former were placed on a deficient diet at the age of 6 months. Macroscopic and microscopic examinations of a large number of specimens disclosed that the uterine pigmentation of vitamin E deficient rats is due mainly to lipofuscin deposited in the cytoplasm of the muscular fibers. This increases as the deficiency continues and is more abundant in the circular layer of fibers than in the longitudinal one. This deposit does not occur in the fibers of local blood vessels. When the deposit is abundant there is alteration of the fibers up to complete disintegration (necrobiosis) and the appearance of free pigment masses and phagocytosis of the pigment by the macrophages. Simultaneously proliferation of the tissue occurs, leading to fibrosis of the myometrium, also more evident in the circular layer of muscles. In 2 cases of recent pregnancy (soon after implantation) the muscular fibers adjacent to the decidua basalis showed scanty pigment, probably due to removal by the activity of the cellular metabolism in contrast to other parts where it was abundant. In 1 of the animals, which was deficient for less than eight months, there was intense fibrosis of the uterine mucosa in all the space between the deep layer of the endometrium (close to the myometrium) and the mucosa adjacent to the mesometrium. This intense fibrosis explains the irreversible sterility, which cannot be altered by the vitamin E when the deficiency has been present for more than ten months.

### Brief Item

Dr. E. N. Harry of Princeton University has given a lecture at the University of Rio de Janeiro on the mechanism of aeroembolism in the accidents of decompression (caisson disease).

## TEACHERS IN THE PRECLINICAL SCIENCES

*To the Editor* —I am writing regarding a subject which I believe should be called to the attention of the profession The subject is familiar to the deans of medical schools and is of considerable concern to teachers and investigators in the preclinical sciences. The subject pertains to the existing shortage of able young men well trained for teaching and investigation in the preclinical sciences and the medical research laboratories of the armed services

The causes of the shortage are quite evident to those who have been concerned with training medical teachers and investigators One cause is the inadequate salary offered to young and able graduates and another is the failure to train medical scientists during the war

The first requirement for a good teacher and investigator, of course, is a zeal to push back the frontiers of ignorance and to inspire students with a desire to know But during the past fifteen years there has been in my experience no great decline in the number of students with the requisite zeal and ability to teach and investigate Nevertheless graduates with zeal and ability did not stay in teaching The reason why is simple. Those graduates with the Ph D, M D degrees were offered positions in physiology pharmacology or biochemistry paying $1 800 to $2 800 a year whereas some physician offered them $6,000 to $10,000 to assist them in their practice The students with only the Ph.D degree had to take the lower salary, which during the last fifteen years has simply not been an adequate living wage for a young man with a wife and one or two children, who has to belong to scientific societies and to travel, at least to some extent.

If medical school administrators want young men with the Ph D M D training they will have to pay better salaries or wait for that rare individual whose zeal cannot be destroyed by a comfortable income.

Another fact which must be considered is that young men interested in a career in science are attracted by the higher salary paid to chemists than to biologists. While visiting a large university recently I was informed that the administration had to pay the members of the department of chemistry such high salaries to retain them that the budgets of the biologic departments had to be cut. The law of supply and demand and income operates in science as well as in other occupations.

A C Ivy, Ph D, M D., Chicago

*To the Editor* —According to my experience and observation in our medical schools for fifty years there have not been enough first class teachers either in the preclinical or in the clinical branches to go around. The war and the growing inflation make this situation worse. Raising salaries, particularly in the preclinical branches, is not going to be a cure all, for first class teachers are not created by cash alone. But better salaries will help a little. The superior teacher is a person of superior ability and application, challenged by the great importance of teaching and training successive generations of students and by the opportunity of research, of pushing back ever so little the immense frontiers of ignorance in biology and medicine. These drives determine such men's career But living salaries are of assistance in the sense that the great teachers and investigators can devote their whole attention to the two great tasks

A. J Carlson, M.D, Chicago

*To the Editor* —The increasing difficulty of attracting able young men and women into the field of preclinical science teaching and research has become a matter of grave concern to many medical educators Several factors have contributed to producing this state of affairs The interruption of graduate training by the war, which will quite possibly be continued by some form of compulsory military service during the postwar years, is one cause of the present shortage of potential preclinical teachers, but it is not the most important one. To an even greater extent the reluctance of outstanding young people to enter this field is due to the inadequate salaries which are paid basic science teachers in the majority of our medical schools

There is no lack of able young men and women who are, or who could be, interested in preclinical teaching and research as a career It is a rare medical class which does not contain at least one student who has the aptitude and interest which would make him an effective teacher or investigator in one or another of these fundamental sciences Indeed, such students not infrequently interrupt their medical training in order to devote a year to further study and investigative work in anatomy, physiology or biochemistry before continuing their regular course. A rather high percentage of them show promise of becoming first rate teachers and investigators, but only a few of them eventually take up that work as a career The loss of such men and women to the more lucrative field of clinical practice is a source of sincere regret to all who are interested in the advancement of the preclinical sciences and in the progress of fundamental teaching and research.

The potential workers who are thus lost by the basic medical sciences are not necessarily those who are more interested in financial gain than in contributing to the advancement of those disciplines They merely recognize that there are limits beyond which they ought not indulge their own interests and preferences at the expense of the comfort and financial security of their families and themselves

The problem, then, is largely one of the inadequacy of the existing salary scale for preclinical teachers It can be solved only by increasing those salaries sufficiently so that there no longer will be so great a difference between them and the amount which men of equal competence can earn in clinical or other fields If the inadequacies of the present salary scale are not corrected, they will result inevitably in a lowering of the quality of both preclinical teaching and research

It has been said that the earnings of full time teachers in the basic sciences compare favorably with the average net income of physicians throughout the country The accuracy of this statement can be questioned, but even if it should be true, it cannot be urged logically as justification for maintaining teaching salaries at their present low levels For it is not the average—the mediocre—to whom the teaching of medical students or the conduct and direction of fundamental research should be entrusted. Both deserve the best brains and abilities that can be mustered, and the young people who possess those qualifications are not likely to remain indifferent to their own economic well-being

This problem and its suggested solution deserve the serious consideration of physicians, university administrators and all others who are interested in maintaining the present high standards of medical education and research in this country If these standards are to remain high, it is essential that medical schools obtain and hold the ablest available teachers and investigators This cannot be accomplished if their work is to remain to such a large degree a labor of love.

## MEDICOLEGAL ABSTRACTS

**Drunkenness Admissibility of Evidence of Chemical Tests of Blood**—The plaintiff, a police officer, was dismissed from the force by the defendant, manager of safety and excise of the city of Denver, on the charge of having been drunk on duty, and the dismissal was sustained by the city civil service commission On appeal to the district court an order was entered reinstating the plaintiff, so the manager of safety appealed to the Supreme Court of Colorado

The evidence showed that the plaintiff, while in full uniform and at a time when he was on duty, was found by other police officers in an unconscious condition. He was lying face downward, had a large bruise on one cheek, there was a skin abrasion on his chin, and the pupils of his eyes were widely dilated. He was picked up and taken to the police station and later to the Denver General Hospital, where a blood alcohol test was made pursuant to the police captain's direction The result of the test disclosed 'Alcohol 39 mg per cc of Blood,' which, according to the evidence, is considered sufficient in most humans to induce a high state of intoxication The police officers who had either discovered the plaintiff in an unconscious condition or had participated in taking him to the police station, and subsequently to the hospital testified on hearing before the manager of safety that they did not believe he had an 'alcoholic breath ' The police captain's testimony was I found an odor of some foreign substance wasn t liquor" The head nurse in the hospital's emergency room testified 'There was an odor, but I couldn't tell what it was," and Dr Crum who withdrew the blood for the alcohol test, testified that he did not smell the odor of alcohol on the plaintiff's breath, but that he believed he was drunk Concerning the safeguards taken in making the test in the instant case, in addition to the testimony of the doctor who withdrew the blood there is the testimony of his assistant who held the test tube into which the plaintiff's blood was poured and who then made a record on the hospital's printed form on which she filled in the date, time of withdrawal, name and who requested the examination, the doctor s name who drew the blood and the laboratory technician's name She then marked the test tube containing the plaintiff's blood and put it in an icebox which was padlocked and to which she and the laboratory technician at the hospital had the only keys The laboratory technician testified that she made an examination of the plaintiff s blood and that the result of this test showed the presence of '39 mg per cc of blood" The plaintiff s counsel although cross examining the laboratory technician as to her qualifications as a witness did not cross examine in respect to the nature of the blood alcohol test which she conducted or how she identified the fact that it was the plaintiff s blood she analyzed No objection was made to introduction of the testimony involving the blood alcohol test in the hearing before the commissioner or before the civil service commission

The plaintiff's defense was that about the midnight that ushered in March 2, 1944 he was suffering from an epileptic seizure of the grand mal type, that he had become unconscious once before just after going off duty the morning of Dec. 16 1943 There was evidence to show that he had been ordered not to drive a car, and that other police officers always took the driver s seat when they started out in police cars

We have been unable to find any case, said the Supreme Court, where the blood test to determine intoxication has been excluded because of its unreliable value as proof The test in the instant case is a purely chemical one with all of the controls directly under the supervision of the three witnesses who testified as to having participated in the test. The plaintiff s counsel assert that if the blood alcohol test be disregarded every other bit of evidence is consistent with the theory that the plaintiff was not under the influence of alcohol The testimony of Dr Crum somewhat weakens counsel's assertion. He stated that the pupils of the plaintiff's eyes at the time of the examination were widely dilated, that his pulse and his breathing were rapid He then testified on redirect examination that such a condition of the eyes and pulse was more indicative of intoxication from alcohol than of an epileptic seizure. The greatest emphasis is made by the plaintiff's counsel on the fact that there was no testimony indicating that the plaintiff, at the time he was picked up unconscious or at the time of the examination for blood alcohol in the hospital, had an odor of alcohol on his breath There appear to be obvious conditions, said the court, where with a high degree of intoxication existing, the odor of alcohol on the breath is not present, such as (1) where it has been disguised by the separate use of deodorants, (2) where the person imbibing has developed a condition of acidosis, in which case the breath takes on the peculiar odor of a person suffering from acidosis (3) where the alcoholic drink has in it a flavor that tends to blot out or modify the typical alcoholic breath. Nor does the testimony that plaintiff's breath had a distinctive odor, but not alcoholic, support the diagnosis of epilepsy Nowhere can we find any indication or reference to the fact that a distinctive odor of the breath either precedes, accompanies or follows a seizure of the grand mal or petit mal type. The testimony concerning the odor of the plaintiff's breath, therefore, would appear to be negative in its nature It does not conclusively prove that he was not intoxicated At the same time it does not support the theory that he had suffered from an epileptic seizure.

As to the final disposition of this case, the Supreme Court concluded, we are of the opinion that the testimony concerning the alcohol test made of plaintiff's blood was part of the evidence that both the manager of safety and excise and the Denver civil service commission could properly consider, that there was sufficient competent evidence to support their respective findings, and that they did not abuse their discretion in so finding Accordingly the judgment reinstating the plaintiff policeman was reversed—*Kirschwing v Farrar, 166 P (2d) 154 (Colo., 1946)*

**Medical Practice Acts Conviction for Prescribing Narcotics to Addicts as Basis for Civil Action to Revoke Professional License**—The state filed a civil action to revoke the defendant's license to practice medicine. From an order denying its motion for a summary judgment it appealed to the Supreme Court of Wisconsin.

After a plea of guilty the defendant, a physician licensed to practice medicine in Wisconsin, was convicted in the federal court on counts charging, in substance, that he prescribed morphine sulfate hypodermic tablets to persons not in the course of his professional practice and not for legitimate and medical purposes but to satisfy the addiction of the purchasers On the basis of such conviction the state commenced this action to revoke his professional license. In his answer the defendant admitted the prior conviction but contended that he had entered his plea without advice of counsel, that the prescribing was in fact, in the course of his professional practice and medically necessary for the benefit of the persons prescribed for and that a plea of guilty should not in fact have been entered That the prescription or sale of narcotics to an addict to satisfy an addiction is an act involving moral turpitude was not contested but the defendant urged that on a civil action being brought to revoke his license he had the right to explain and qualify the facts and circumstances surrounding conviction for the purpose of showing that he was in fact not guilty of conduct actually involving moral turpitude

Section 147.20 of the Wisconsin Statutes provides that

> Upon verified complaint in writing to the district attorney charging the holder of a license or certificate of registration from the state board of medical examiners with having been guilty of immoral or unprofessional conduct the district attorney shall bring civil action in the circuit court against the holder and in the name of the state as plaintiff to revoke the license or certificate If the court or the jury finds for the plaintiff judgment shall be rendered revoking the license or certificate and the clerk of the court shall file a certified copy of the judgment with the board of medical examiners

It is clear to us, said the court, that conviction for a crime involving moral turpitude is a separate, distinct and independent ground for revoking a license and that facts and circumstances claimed to qualify or render innocuous the acts resulting in conviction may not be set up in the civil action. The statute specifically makes the conviction, and not the facts on which it is grounded, the cause for revoking the license. Since in this case, the court continued, defendant admits conviction of an

offense involving moral turpitude he is left without defense Accordingly the order denying the state's motion for a summary judgment was reversed with directions to enter judgment against the defendant physician—*State v Willstead M D 21 N W (2d) 271 (Wis, 1946)*

**Basic Science Acts License to Practice Chiropractic by Reciprocity**—The plaintiff, Arkansas Medical Society, sued for an injunction to restrain the defendant, state board of chiropractic examiners, from granting licenses to practice chiropractic without requiring applicants to present a certificate of ability issued by the state board of examiners in the basic sciences In that case (*Stroud v Crow*, 199 Ark 814 136 S W (2d) 1025, 61 S Ct. 17, J A M A **115** 2111 [Dec 14] 1940) an order was entered in favor of the plaintiff granting "the relief prayed" The present suit arose on the plaintiff's motion asking enforcement of the prior order From a ruling in favor of the defendant, the plaintiff appealed to the Supreme Court of Arkansas

The plaintiff's motion stated that subsequent to the entry of the previous judgment, the defendant has been issuing licenses to practice chiropractic by reciprocity to applicants licensed in other states, without first requiring the presentation of a certificate from the Arkansas basic sciences board It asked that such action be prohibited.

In the motion said the Supreme Court, we are asked to make an order by which the Arkansas state board of chiropractic examiners and their successors in office would be enjoined from issuing licenses to practice chiropractic, by reciprocity or otherwise until a certificate from the state board of examiners in the basic sciences of this state has been issued to the applicant in accordance with the basic sciences act. An examination of the pleadings briefs and opinion of this court in the original proceeding discloses that the question of the right of the state board of chiropractic examiners to grant licenses by reciprocity without the certificate from the basic sciences board was not therein presented, argued or decided. The sole issue in the original proceeding, continued the court, was whether the law required an applicant desiring to take the examination for license to practice chiropractic to present a certificate of ability from the basic sciences board We are now asked after lapse of the term at which our former judgment was rendered to make a substantial change in this judgment by disposing of a question not presented or decided It is our conclusion that this question is not properly brought before us in the instant proceeding Nothing in this opinion, however concluded the court should be construed as deciding the question as to whether the chiropractic board of examiners in issuing licenses by reciprocity, may dispense with the requirement of the certificate from the basic sciences board The plaintiff's motion was denied—*Stroud v Crow State Board of Chiropractic Examiners 192 S W (2d) 548 (Ark, 1946)*

**Drunkenness Drunk-o-Meter, Waiver of Constitutional Protection Against Self Incrimination.**—The defendant was convicted of operating a motor vehicle on a public highway while under the influence of intoxicating liquor From such conviction he appealed to the Supreme Court of Indiana

After the defendant's arrest he was taken to police headquarters, where he was asked to submit to a drunk-o-meter test. He was advised that he had a constitutional right to refuse to take the test and that he would not be required to take it The defendant testified that the police did not abuse him in any way that he took the test voluntarily and that he was glad to do so because he was not drunk. In spite of this state of affairs, the defendant contended on appeal that the admission in evidence of the results of such test had the effect of requiring him to testify against himself and therefore constituted an encroachment on his constitutional protection He did not argue that the drunk-o-meter test had no probative value or that the instrument was not scientifically reliable in the hands of competent persons On this state of the record concluded the Supreme Court, there can be no valid claim of forced self incrimination. The provisions of the constitution on which the defendant relied afford no protection that may not be waived by him Accordingly the conviction was sustained—*Spitler v State 46 N E (2d) 591 (Ind 1943)*

## AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1936 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied with stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (*) are abstracted below.

**Pericoronary Neurectomy and Ligation of Great Cardiac Vein.**—Fauteux says that although coronary venous ligation could do no more than hasten the development of the coronary anastomotic system the experimental results were so encouraging that it was decided to attempt the method in a carefully selected group of patients. The first patient was operated on in 1939. Since then 9 other patients have received the same treatment. One patient died one hour after operation as the result of a tension pneumothorax resulting from a tear in the pleura which occurred while the heart was being exposed. Of the remaining 9 patients 7 are still alive and have resumed their former work. The effects of venous ligation on the vascularity of the heart could be studied in the patient who lived over two and one-half years after operation. The histologic sections demonstrated that venous ligation in the heart opens and dilates coronary anastomoses, but the coronary nervous system is not modified by this operation. Experimental studies on groups of dogs suggested that pericoronary neurectomy with ligation of the great cardiac vein would be of greater value in the treatment of coronary disease than venous ligation alone. On Sept. 11, 1944 the first complete denervation of the left coronary artery in man was performed at the Peter Bent Brigham Hospital. Since the operation the patient has shown much improvement, has had no pain and has been able to work.

**Auricular Fibrillation and Bacterial Endocarditis.**—McDonald studied 286 cases of bacterial endocarditis, all of which came to necropsy. Of the 196 cases in which the character of the fibrillation was analyzed 3 were of the paroxysmal type and 21 were of the persistent variety. Of the 21 cases of persistent fibrillation, in 5 there had been an antecedent bacterial endocarditis, in 6 the auricular fibrillation was present before the onset of bacterial endocarditis, and in 10 both processes were present when observations began. The incidence of auricular fibrillation was approximately the same irrespective of the type of valvular involvement. The reason the incidence of auricular fibrillation is significantly lower in bacterial endocarditis than in rheumatic heart disease seems to be that in most cases of bacterial endocarditis fatal sepsis intervenes while the patients are relatively young and before the disturbance of the myocardial integrity becomes severe. The study suggests that the coexistence of auricular fibrillation and bacterial endocarditis is not so rare as was previously supposed and that one should therefore be cautious in using this point as a diagnostic aid.

**Serum Agglutination Reaction in Bacillary Dysentery.**—Thomas and Levine observed that the agglutination reaction of several patients' serums against bacillary dysentery bacilli disclosed titers of 1:160 against the Shiga and 1:320 for the Y strain of the Flexner (or paradysentery) bacillus. The question arose as to whether these serologic findings indicate (1) that the patient was suffering from both Shiga and Flexner dysentery, (2) that the antigens employed are not suitable for determination of agglutination titers or (3) that the agglutination test was not a reliable and dependable index of bacillary dysentery infection. The clinical pictures were not sufficiently distinct to warrant a specific diagnosis. Repeated bacteriologic examination of the stools and rectal swabs failed to disclose members of the Shigella group. These failures served further to raise doubt as to the significance of the serologic findings. Meanwhile 10 serums submitted for routine Kahn tests were examined for agglutinins against the Shiga and Flexner Y strains. Of these serums 6 showed titers of 1:80 to 1:160 with the Shiga and 8 gave titers of 1:160 to 1:320 against the Flexner Y strain. Among these serums were 6 from prenatal cases. None of these serum specimens were from persons with dysentery or other symptoms of intestinal disease. A study was therefore undertaken to ascertain whether the strains supplied by the Army Medical School were suitable for determination of Shigella agglutination titers. The authors present the agglutination titers of serums from 534 service and civilian men and women (submitted for routine Kahn tests at a southern army camp) against Shigella dysenteriae, Shigella ambigua, Shigella sonnei, Shigella newcastle and five races of S. paradysenteriae (V, W, X, Y, Z). It became evident that agglutination titers considered indicative of infection are far too frequent in serums of persons without gastroenteritis to warrant their employment as criteria of acute bacillary dysentery. This is particularly the case for S. dysenteriae, S. ambigua and S. paradysenteriae Y and W.

**Spondylolisthesis Diagnosis of True Anterior Slip**—Garland and Thomas reviewed 170 consecutive lumbosacral spine roentgen examinations and found that 25 persons or 14.7 per cent had more or less foreshortened last lumbar segments In 15 of these no neural arch defects were present but the posterior edge of the last lumbar body lay from 1 to 3 mm ventral to the plane of that of the first sacral In the other 9 there were arch defects, but in only 4 was the anterior margin of the fifth lumbar body ventral to the test line (that is, only 4 of the 9 showed true spondylolisthesis) There were an additional 4 cases of true slip with bodies of normal' shape and length In the remainder of the 170 cases or 85 3 per cent the last lumbar bodies were either normal in shape and length or a little elongated so that their posterior margins lay on a plane slightly behind that of the first sacral In general, if the fifth lumbar body is normally 'rectangular' and proportionate in size to its adjacent segments there is a slip (olisthesis) only when its anterior margin reaches or passes the perpendicular test line drawn from the first sacral If the fifth lumbar body is foreshortened and its shape in lateral projection is hatchet-like the relation of its posterior margin to that of the first sacral cannot be relied on for the detection of slip In extreme cases of foreshortening its anterior margin might be equally unreliable Neither the anterior nor the posterior margin measurements are criteria in all cases but in the vast majority the anterior margin measurements are the more reliable

**Duplication of Large Intestine**—A woman aged 27 with a history of recurrent attacks of lower abdominal pain and severe obstipation had been operated on for acute intestinal obstruction at 3 years of age and for acute appendicitis at 19 Two appendixes were removed one of which was gangrenous Three years later the abdomen was explored because of symptoms of partial intestinal obstruction and an unsuccessful attempt was made to remove what was thought to be a mesenteric cyst. A cutaneous fistula developed in the abdominal scar At operation a double uterus and double cervix were noted and there was a history of two miscarriages In the course of a surgical exploration by Dixon duplication of the entire colon with a common mesentery was found Because of severe inflammatory reaction, the descending and sigmoid portions of both colons were freed from the abdominal wall and about 10 inches of each was resected after exteriorization and application of clamps There was no evidence of a kidney on the right side. The left kidney seemed to be about one and one-half times normal size. Exploration of the pelvis revealed two infantile uteri At the second operation the continuity of the exteriorized loops of the two colons was accomplished by end to end anastomosis, producing what is essentially a colocolostomy in the midsigmoid Reports of duplication of the small intestine are relatively frequent, but Weber and Dixon found no instance of a duplication of the large intestine in which the supernumerary intestine had no communication with the small intestine above it or with the outside via the rectum

**Multiple Parathyroid Adenomas**—A man aged 62 whose history included pulmonary tuberculosis twenty-five years before and a left nephrotomy for the removal of multiple renal calculi twenty-one years before subsequently developed a bladder calculus with signs and symptoms of hyperparathyroidism The first operation at which only the right side of the neck was explored resulted in the removal of a parathyroid adenoma The symptoms persisted as did the hypercalcemia and the elevated serum phosphatase A second operation seven weeks later failed to reveal a parathyroid adenoma At a third operation a large parathyroid tumor containing remnants of thymus tissue was found on the left side The patient died shortly afterward with evidence of cardiac failure Moehlig and Ulch raise the question whether the treatment for pulmonary tuberculosis with its high caloric diet and increased milk intake and subsequent load on the parathyroids may have played a part in the development of the parathyroid adenomas Remarkable is the long interval between the appearance of the renal calculi twenty-one years before and the subsequent development of the typical signs and symptoms of hyperparathyroidism They stress that an exhaustive exploration must be done on both sides even though a large tumor may be readily found on one side

**Granuloma Venereum of Uterus**—The first 4 cases of venereal granuloma of the uterus were described by Pund and his associates Polayes and Wikle report a fifth case A Negro woman aged 50 on whom supracervical hysterectomy and right salpingo-oophorectomy were performed proved to have venereal lymphogranuloma of the uterus, fibromyomas of the uterus and fibrosis and follicular cysts of the ovary As Donovan bodies were found in the endometrium, the cervical ulcer was reexamined as a possible primary source for the uterine infection Microscopic examination of tissue from the cervix revealed many of the pathognomonic cells of Pund which contained Donovan bodies in abundance. Ever since the authors were able

develop between the base of the lung and the upper surface of the diaphragm If effusion develops along with the pleural involvement, plastic changes occur at the costophrenic and cardiophrenic angles in definite widening of these acute angles The severity of the symptoms is variable Treatment has been primarily symptomatic Sedatives and physical therapy have been employed At times opiates had to be administered to keep the patient comfortable The disease itself is self limited but has a tendency to recur The attacks often follow a cold that comes on with atmospheric changes

*Effect of Alumina Gel on Absorption of Amino Acids Ascorbic Acid, Glucose and Neutral Fat from Intestinal Tract. W S Hoffman and H A. Dyniewicz.—p 50

**Alumina Gel and Intestinal Absorption.**—Hoffman and Dyniewicz studied the influence of alumina gel on the tolerance curves of amino acids, ascorbic acid, glucose and neutral fats With neutral fat there was obviously no flattening of the tolerance curves by alumina gel With amino acids ascorbic acid and especially glucose there was a slight lowering of the average maximal rise in each group with alumina gel, but these were statistically insignificant However, 27 of 39 individual experiments showed lower maximal rises with alumina gel than in the control experiments When 1 ounce of aluminum phosphate gel was used with glucose in additional experiments, the depression of the tolerance curve was even less than with alumina gel *The results obtained indicate that from a nutritional point of view therapeutic doses of alumina gel (or aluminum phosphate gel) have no demonstrable effect on the absorption of the nutrient substances studied.*

**Asthma in the Southwest Pacific Area**—Winkenwerder says that 352 patients with asthma, representing 1 2 per cent of total admissions, were observed at a general hospital in the Southwest Pacific area. Of 209 who were studied in detail, 107 developed asthma prior to service and 102 after entering military service Development of asthma, either recurrence, aggravation or primary attack, was perennial, seasonal factors apparently exerted no influence thereon Atmospheric pollen can be found throughout the year in the areas concerned A positive family or personal history of hay fever and/or asthma and of skin sensitivity to pollen and other inhalant antigens was found singly or in combination in the majority of patients. Conditions which aggravated or induced attacks in susceptible persons were, in addition to pollen and other environmental dusts damp humid weather, diurnal temperature variations (from warm to cold) and physical and emotional strain. In 115, or 55 per cent, pollen and inhalant dusts were responsible, in 29, or 14 per cent, infection, and in 65 the probable causes could not be defined, but in these environmental conditions probably played an important part The disability rate per patient represented by hospital days was rather high minimum was 5, the maximum 225 and the average 58.98. hundred and seventy two patients, or 82 per cent, evacuated to the United States Desensitization to pollen other environmental dusts was instituted and in a small such treatment appeared to be beneficial. It is suggested soldiers with a history of or manifesting mild asthma not undertake tropical service Even the presence of should be seriously considered as a disqualifying c general service overseas

to corroborate Pund and Greenblatt's contention that the Donovan bodies can be readily observed in routine tissue sections stained with Delafield's hematoxylin and eosin, they have been able to diagnose granuloma inguinale with much greater ease than before They suspect that in the past they overlooked instances of venereal granuloma, mistaking them for nonspecific granuloma Search for the Donovan bodies in smears from the vaginal discharge is recommended in suspected cases of venereal granuloma as an adjuvant method of identification of the organism

**Spirometric Study in Thoracoplasty**—Leiner studied the pulmonary function by means of spirometry and broncho spirometry in 26 patients before and after four to eight rib thoracoplasties There was usually a slight, insignificant decrease of oxygen intake and basal metabolic rate There was a slight increase of the minute volume of respiration and of the respiratory rate and a slight decrease of the tidal air The ventilation equivalent increased slightly Vital capacity, reserve air, complementary air, maximum breathing capacity and $\frac{\text{Maximum breathing capacity}}{\text{Minute volume}}$ showed a definite decrease In the collapsed lung bronchospirometry revealed a decrease of oxygen intake minute volume and tidal air and a slight decrease of the ventilation equivalent, showing a more efficient use of the ventilated air Vital capacity, reserve air and complementary air dropped considerably In the contralateral lung there was a compensatory increase of the oxygen intake a slight increase of the minute volume tidal air and ventilation equivalent showed no significant change, vital capacity, reserve air and complementary air dropped slightly On the thoracoplasty side the tidal air presented a larger part of the vital capacity after thoracoplasty than before On the contralateral side the relation of vital capacity to its subdivisions remained unchanged The impairment of pulmonary functions under thoracoplasty treatment is less severe than under pneumothorax treatment

**Structural Changes in Thyroids After Treatment with Thiouracil**—Halpert and his associates present observations on 7 patients with hyperthyroidism in whom a bilateral subtotal thyroidectomy was performed in one or two stages Two patients had received preoperative therapy consisting of thiouracil only, 3 were treated with strong solution of iodine U S P followed by thiouracil and 2 were treated with thiouracil followed by strong solution of iodine. Preparations were stained with hematoxylin and eosin Sections stained with Heidenhain's azocarmine and by Van Gieson's method were also studied In the glands removed following the administration of thiouracil only, the acinous content stained lightly and was decreased or absent, and the cells lining the acini were low or tall columnar These changes were similar to those seen in thyroid glands of untreated patients in an active state of hyperthyroidism In the patients treated with strong solution of iodine U S P followed by thiouracil, subtotal thyroidectomy was performed in two stages In preparation for the first stage only strong solution of iodine was given In preparation for the second stage thiouracil was given Thus the effects of iodine and thiouracil could be compared and contrasted in the same patient Following the administration of thiouracil, the cells of the acini changed from cuboidal to columnar, and the colloid disappeared or lessened in density and became vacuolated and scalloped In the glands removed after the administration of thiouracil followed by strong solution of iodine a refilling of the acini with colloid could be observed, together with a change of the lining cells from columnar to low columnar or cuboidal According to these observations the acinous colloid diminishes in quantity and density or disappears under the influence of thiouracil The variance between structure and function of the thyroid gland following the administration of thiouracil supports the assertion that thiouracil inhibits the production of new colloid and does not interfere with the use of the available colloid

Review of Urologic Surgery A J Scholl F Hinman, A B Hepler and others —p 225

**Synthetic Adhesives in Treatment of Wounds of Liver**—Lowry used commercial Scotch tape to control hemorrhage in abdominal viscera and elsewhere Ordinary Scotch tape is made of three layers (1) a backing, usually cellophane, (2) a filler or a binder, of rope stock, and (3) an adhesive face of crude rubber or some synthetic substitute. At Lowry's suggestion the makers of Scotch tape developed new and experimental synthetic combinations for further investigation on animals To date eleven different synthetic combinations of Scotch tape have been manufactured for these experiments The backings for these combinations consist either of cellophane or of polyvinyl alcohol All but one experimental sample contain rope stock paper filler Various adhesives, such as crude rubber, polyisobutylene Buna S and synthetic resin adhesives, have been incorporated into the facing surface of the tape Seventeen rabbits had sections of their livers removed and the gap covered above and below by an envelop of Scotch tape. Sixteen of the animals made complete recoveries In mice, small pieces of tape made of polyvinyl alcohol and synthetic resins, polyvinyl alcohol and polyisobutylene and polyvinyl alcohol and crude rubber inserted intraperitoneally were completely absorbed at the end of one month No tissue reaction was noted, even though rope stock was part of the tape Some substance in the synthetic resins apparently exerts a pronounced hemostatic action, as this adhesive controlled bleeding the most readily Further animal experimentation and sterilization studies are indicated before a tape can be recommended for clinical use

**Asthma in the Southwest Pacific Area** —Winkenwerder says that 352 patients with asthma, representing 1 2 per cent of total admissions, were observed at a general hospital in the Southwest Pacific area Of 209 who were studied in detail, 107 developed asthma prior to service and 102 after entering military service Development of asthma either recurrence, aggravation or primary attack, was perennial, seasonal factors apparently exerted no influence thereon Atmospheric pollen can be found throughout the year in the areas concerned A positive family or personal history of hay fever and/or asthma and of skin sensitivity to pollen and other inhalant antigens was found singly or in combination in the majority of patients Conditions which aggravated or induced attacks in susceptible persons were in addition to pollen and other environmental dusts damp humid weather diurnal temperature variations (from warm to cold) and physical and emotional strain In 115 or 55 per cent, pollen and inhalant dusts were responsible, in 29 or 14 per cent infection, and in 65 the probable causes could not be defined, but in these environmental conditions probably played an important part The disability rate per patient represented by hospital days was rather high the minimum was 5, the maximum 225 and the average 58.98 One hundred and seventy-two patients, or 82 per cent were evacuated to the United States Desensitization to pollens and other environmental dusts was instituted and in a small number such treatment appeared to be beneficial It is suggested that soldiers with a history of or manifesting mild asthma should not undertake tropical service Even the presence of hay fever should be seriously considered as a disqualifying condition for general service overseas

**Nutrition Among Manitoba Indians** —Moore and his associates made a survey of the dietary habits and the nutritional status of more than 400 Canadian Bush Indians The dietary intake failed to meet the recommended daily allowances for most nutrients For a number of the nutrients the diet was greatly deficient The most pronounced vitamin deficiencies were vitamin A, vitamin $B_2$ (riboflavin) and vitamin C (ascorbic acid) Multiple tissue changes were encountered in practically every Indian examined the most severe changes being in the conjunctivas, the blood vessels at the corneal scleral junction and the gums The parallel between the prevalence and the severity of these signs and the degree of the deficiencies in the food supply is striking The Indian infant mortality rate the crude mortality rate and the death rate from tuberculosis are many times higher than in the white population It is not unlikely that many characteristics, such as shiftlessness indolence improvidence and inertia, so long regarded as inherent or hereditary traits in the Indian race, may be really the manifestations of malnutrition Furthermore, it is probable that the great susceptibility of Indians to many diseases paramount among which is tuberculosis may be attributable among other causes to their high degree of malnutrition

Separation Center Chest Survey L Schneider —p 147
Chest Specialist His Training and Services M S Lloyd —p 153

**Acute Primary Diaphragmitis** —Joannides reports 5 cases of acute primary diaphragmitis (Hedblom's syndrome) in 3 men and 2 women between the ages of 38 and 66 The clinical manifestations of this syndrome are inspiratory pain (ponopnea) on the affected side limitation of mobility of the lower chest wall and a tendency to a flaring out of the costal margin with each inspiration There may also be pain in the upper quadrant of the abdomen with a tendency to muscle spasm The patient may complain of pain in the homolateral shoulder and the trapezoid ridge. Roentgenologically there is a tendency of the involved diaphragmatic leaf to rise mobility may be limited or even absent. If there is pleural involvement, adhesions may

develop between the base of the lung and the upper surface of the diaphragm If effusion develops along with the pleural involvement, plastic changes occur at the costophrenic and cardiophrenic angles in definite widening of these acute angles The severity of the symptoms is variable Treatment has been primarily symptomatic Sedatives and physical therapy have been employed At times opiates had to be administered to keep the patient comfortable The disease itself is self limited but has a tendency to recur The attacks often follow a cold that comes on with atmospheric changes

*Effect of Alumina Gel on Absorption of Amino Acids Ascorbic Acid Glucose and Neutral Fat from Intestinal Tract. W S Hoffman and H A Dymewicz—p 50

**Alumina Gel and Intestinal Absorption.**—Hoffman and Dymewicz studied the influence of alumina gel on the tolerance curves of amino acids, ascorbic acid, glucose and neutral fats With neutral fat there was obviously no flattening of the tolerance curves by alumina gel. With amino acids ascorbic acid and especially glucose there was a slight lowering of the average maximal rise in each group with alumina gel but these were statistically insignificant However, 27 of 39 individual experiments showed lower maximal rises with alumina gel than in the control experiments When 1 ounce of aluminum phosphate gel was used with glucose in additional experiments, the depression of the tolerance curve was even less than with alumina gel The results obtained indicate that from a nutritional point of view therapeutic doses of alumina gel (or aluminum phosphate gel) have no demonstrable effect on the absorption of the nutrient substances studied.

*Epidemic Ringworm of Scalp in Children R Nomland—p 155

**Toxic Effects of Large Doses of Vitamin D**—Paul presents 5 cases to illustrate the clinical signs of vitamin D poisoning He stresses that large doses of vitamin D may cause severe hypervitaminosis particularly if combined with a high calcium intake in the form of milk The dose of vitamin D should be based on body weight rather than age, and whether or not it is given in milk. The usual toxic symptoms of vitamin D administration are headache nausea vomiting, diarrhea, epigastric fulness, polyuria and polydipsia The signs of toxicity are low specific gravity of the urine, traces of albumin in the urine, inability to concentrate urine, increased serum calcium, renal failure, retention of nonprotein nitrogen, deposition of calcium in soft tissues, deposition of calcium in arteries and arterioles and, eventually death Massive doses of vitamin D do not alter the ultimate course of arthritis Whenever massive doses of vitamin D are prescribed, the urine should be examined frequently and serum calcium levels should be obtained

**Epidemic Ringworm of Scalp in Children.**—Nomland says that ringworm of the scalp assumed epidemic proportions in the United States in 1942, when it increased many fold in New York City From this focus the epidemic spread widely, at first to the large metropolitan centers throughout the country and later to the smaller cities and villages The epidemic became of concern to Iowa about two years ago The first case at the University Hospitals was seen in September 1944 Since then about 20 patients, who came chiefly from the larger communities in eastern Iowa, have been seen

**St Louis Encephalitis Virus**—Hammon and his collaborators state that of three species of mammals tested by peripheral inoculation (guinea pig cat and horse) none showed viremia under conditions which suggested that any of these species would serve as a frequent source of mosquito infection Of the birds tested (chicken duck and dove) all developed viremia and might readily serve as natural sources of mosquito infection. Chickens were shown to be highly susceptible to infection by minute amounts of virus inoculated subcutaneously Virus may appear in the blood of chickens within sixteen hours after inoculation and it has persisted till at least the 120th hour No fowl showed signs of illness as a result of the infection

**Japanese B Encephalitis Virus**—Reeves and Hammon tested ten common species of Western North American mosquitoes for their ability to act as vectors of Japanese B encephalitis virus Of the ten species of mosquitoes tested

seven were demonstrated to be laboratory vectors These seven species represent three genera (Culex, Aedes and Culiseta) Transmission was made to mice twenty-one times and to a chicken once These data, in addition to the published accounts by Japanese and Russian workers of the natural epidemiology of this disease, lead the authors to believe that this virus might well establish itself in North America especially if introduced in areas where native encephalitides are now endemic These studies also indicate that species of mosquitoes (Culex tarsalis, Culex pipiens, Aedes dorsalis and Culiseta inornata) now known to be fully incriminated vectors of the western equine or St Louis encephalitis viruses can also serve as laboratory vectors of the Japanese B virus

**Inactivated Dysentery Vaccines**—According to Shaughnessy and his colleagues several lots of irradiated monovalent and mixed dysentery vaccines showed no significant loss in potency after storage for three to seven months at 3 to 5 C Irradiated mixed dysentery vaccine induced a higher degree of active immunity in mice than heated and formaldehydized vaccines prepared from the same suspension. Volunteers immunized with the five-strain irradiated mixed dysentery vaccine (Flexner V W Z Boyd 88 and sonnei) responded with significant increases in mouse protective antibodies The vaccine caused only moderate local and no systemic reactions The mouse protective antibody titer fell materially after an interval of six months a recall injection of vaccine produced some increase in the titer but not to the original levels

**Response of Gonorrhea to Sulfathiazole and Penicillin.**—Mauss treated 144 patients with gonorrhea Seventy-five patients, 66 women and 9 men, were given a total of 22 Gm of sulfathiazole over a five day period The first two doses were of 2 Gm. each given at an interval of two hours Thereafter 1 Gm was given every four hours during the day until 22 Gm had been administered Fifty-one patients of this group (68 per cent) were rendered negative after a single five day course of this therapy Eight required two or more courses, so that a total of 59 patients (77 per cent) were cured Sixteen patients (13 women and 3 men) remained positive in spite of repeated treatment Sixty-nine patients (55 women and 14 men) were treated with penicillin. Sixty-six (96 per cent) of them were rendered negative with a single course of penicillin (150 000 to 200 000 units), and on retreatment with 300 000 units the remaining 3 (4 per cent) were rendered negative so that 100 per cent were cured Thirty-three of these patients had been sulfonamide resistant and all of them were cured after a single course of penicillin The follow-up control of the patients treated with sulfathiazole showed that patients given sulfonamides should be observed for a minimum of three months before being considered cured Many failures in this series would have been missed if observations had been terminated earlier The number of initial penicillin failures in this series was too small to provide any valid idea as to how long post-treatment observation should be continued routinely before patients are considered cured

troscopy revealed the presence of the tumor At surgery a leiomyosarcoma was found growing expansively into the omentum and pancreas Total gastrectomy with extirpation of the spleen and the tail of the pancreas led to a cure The third patient presented the picture of pernicious anemia X ray examination and gastroscopy revealed a circumscribed tumor of the upper third of the stomach without gastritis In the gross resected specimen this tumor was found to be a pedunculated one but only at microscopic examination was the diagnosis of leiomyosarcoma made The tumor was removed by extensive resection and the patient survived The fourth patient had had severe attacks of hematemesis and melena for over a year Surgery revealed an intramural leiomyosarcoma Total gastrectomy with splenectomy and partial pancreatectomy was performed but the patient died from massive pulmonary atelectasis The authors conclude that the x-ray diagnosis would have been possible in 3 cases and that correct gastroscopic diagnosis should have been made in 3 The preoperative diagnosis of leiomyosarcoma of the stomach is possible X-ray treatment of gastric leiomyosarcoma is ineffective Surgery proved to be satisfactory

**Composite Free Grafts of Skin and Cartilage from the Ear**—Brown and Cannon say that sections of the border of the ear containing two surfaces of skin with cartilage in between have been successfully transplanted as free grafts and defects of the nostril border tip and columella have been repaired satisfactorily in a single operation. This procedure results in a better appearance than any other method and there is minimal deformity of the donor site and the use of bulk flaps is avoided The ear can be repaired with a local flap or by burying the open ear under a direct scalp flap from behind and freeing it and grafting the defect two to three weeks later The procedure is useful for tissue losses from burns gunshot and shell fragment wounds as well as other traumatic or operative losses

**Subcutaneous Heparin in Frostbite**—Lange and Loewe state that animal experimentation substantiated the fact that the timely use of heparin prevents gangrene whereas control untreated animals uniformly develop gangrene. The subcutaneous heparin preparation in the Pitkin menstruum seemed uniquely applicable and the authors used it on human volunteers This method of depositing heparin achieves a consistent, retarded and equal release of the anticoagulant. The Pitkin menstruum which was designed to regulate the rate of release of water soluble drugs is composed of gelatin dextrose glacial acetic acid and water The contents of the ampules are liquefied in hot tap water, drawn up through a 2 to 2½ inch, 18 gage needle into a 5 or 10 cc syringe and injected subcutaneously preferably into the anterior or lateral aspect of the thigh The injections are given every day or every other

**Colloid Cyst of Third Ventricle**—According to Wilson the rare lesions of the third ventricle, variously known as colloid, paraphysial or neuroepithelial cysts, arise from the velum transversum of the anterior part of the roof of the third ventricle from an embryonic anlage of the paraphysis A man aged 24, admitted to the neurosurgical service of the Charleston General Hospital Aug 12 1940, had been subject to bouts of generalized headache for the past three years Often when stooping over to pick up an object he would become blind and dizzy for a few moments Headaches had become much more frequent during the past nine months Ventriculography revealed dilated lateral ventricles without shift indicating a midline tumor completely obstructing the left foramen of Monro and almost completely obstructing the right. The tumor appeared, therefore to be in the anterior portion of the third ventricle A right frontal craniotomy was performed As soon as the right foramen of Monro was exposed a smooth, grayish glistening mass was seen presenting through the foramen. This was grasped with tissue forceps and a small piece the size of a tear drop, came off without bleeding The margins of the foramen were incised the foramen was enlarged, and the complete tumor the size of a cherry stone, was delivered without hemorrhage The postoperative course while somewhat stormy, was satisfactory The patient was able to return to his work and in 1943 was ordered for induction

**Prolongation of Life Span of Rats by Intermittent Fasting**—Carlson and Hoelzel have observed that when a sufficient amount of choice food is available laboratory rats, like many human beings, eat enough to become more or less obese. Observations previously made showed that rats which were fasted every other day and fed a diet low in protein between fasts developed peptic ulcers in the forestomach within about two weeks However, rats fed a diet adequate in protein between single-day fasts usually remained free from peptic ulcers In the studies described here 137 rats (60 males and 77 females), raised in the laboratory from rats obtained from the Wistar Institute, were used These were all of the rats in seventeen litters with two or more of one sex or both sexes raised. Tests in which a group of 33 rats were allowed the same food ad libitum and groups of 37, 37 and 30 rats were fasted one day in four, three and two, respectively, after the age of 42 days, showed that the apparent life span was increased by the intermittent fasting The optimum amount of fasting appeared to be fasting one day in three, and this increased the life span of littermate males about 20 per cent and littermate females about 15 per cent. However, the preexperimental condition of the individual rats was also found to be an important factor determining the life spans No drastic retardation of growth was produced by the intermittent fasting, but the development of mammary tumors was retarded in proportion to the amount of fasting

**Streptomycin.**—Hinshaw and Feldman state that the range of efficacy of streptomycin extends the possibility of antibiotic therapy to treatment of several diseases which are not amenable to treatment with other chemotherapeutic agents Experimental tuberculosis of guinea pigs may be arrested by prolonged treatment with streptomycin even though the disease has been permitted to become well developed prior to institution of therapy A total of 54 patients with different types of clinical tuberculosis have been treated with streptomycin Present evidence clearly indicates that streptomycin does not exert a rapidly curative effect on clinical tuberculosis, although it does appear to modify the course of the disease in a favorable manner and exert a suppressive effect on previously progressive tuberculosis. At the present time it must not be considered to be a substitute for any other form of treatment

**Histoplasmosis.**—McLeod and his associates report that 4 cases of histoplasmosis (2 new and 2 previously reported) occurred in children living in a rural area in Loudoun County, Va., within a radius of 10 miles of one another The 2 new patients were brothers, constituting the first reported instance of histoplasmosis in siblings Histoplasma capsulatum was isolated in culture antemortem from both although neither reacted to histoplasmin The possibility of transmission from one brother to the other is considered A search for an animal reservoir in this area was not successful Histoplasmin reactions in guinea pigs with experimental moniliasis are reported. The skin reactions induced in other mycoses indicate that histoplasmin is not a suitable diagnostic agent. The disease may have an acute onset and terminate rapidly, while, on the other hand, it may appear in a chronic form with irregular exacerbations and long remissions Of the 4 patients 1 pursued a rapid fulminating course and died seven weeks after the onset of the illness His brother followed a considerably more chronic course, the disease process lasting one year The duration of the disease in the other 2 was seven months and eighteen months respectively Several types of therapy have been attempted in cases of histoplasmosis, including sulfonamide drugs quinine, ammonium and potassium tartrate, arsenicals, pentnucleotide

and iodides There have been no noticeable therapeutic effects from any of these drugs Neostam (stibium glucoside), an antimony compound, has been used in several cases with equivocal results The effect of roentgen therapy was also only palliative and did not seem to alter the course of the disease

**Unilateral Renal Hypertension**—Kittredge and Brown report observations on 4 patients with unilateral renal hypertension treated by them at the Ochsner Clinic Of patients who require nephrectomy for well established unilateral renal disease, only a small percentage can expect relief from coexisting hypertension The possibility of cure is influenced by the duration of the hypertension, as in chronic hypertension irreversible vascular changes may have occurred in the opposite kidney which will prevent a return of the blood pressure to normal Unilateral atrophic pyelonephritis apparently offers the most promise of cure by nephrectomy Patients with tuberculosis, renal neoplasm and renal calculi with infection also may be benefited by this operation. Evaluation of changes in blood pressure following nephrectomy is essential No patient should be considered cured until followed for at least a year, since postoperative bed rest and the removal of toxic irritants contained within such diseased kidneys can cause a temporary fall in blood pressure

**Homologous Serum Jaundice Following Administration of Pooled Plasma**—Grossman and Saward present 8 cases of hepatitis with jaundice which developed following the use of commercial pooled plasma The patients had incubation periods ranging from fifty-four to one hundred and thirty-nine days, which conforms with the incubation period of the experimentally induced disease None of the patients were seriously ill except 1, who died The necropsy findings in this patient differed in no way from those in cases ending in death following hepatitis due to the administration of yellow fever vaccine nor are the findings different from those in deaths from infectious hepatitis During the two year period during which these cases were observed, five hundred and one transfusions of commercial pooled plasma were administered The occurrence of 8 cases gives an incidence of 2 per cent but this represents a minimal rather than a true incidence, since many patients received more than one transfusion and since patients who developed hepatitis were treated as outpatients or by physicians elsewhere and did not come to the attention of the authors Furthermore, patients who did not develop clinical jaundice but nevertheless had the clinical features of acute hepatitis, such as nausea vomiting anorexia and malaise, were not included The authors think that the hazard of hepatitis and even fatality from pooled plasma is greater than that of a whole blood transfusion from a single donor

**Amyotonia Congenita**—A boy who seemed normal at birth but who later showed flaccid extremities and who coughed and gurgled as though he was having difficulty in swallowing was unable to sit up or hold his head erect when he was nearly 6 months old, and his arms and legs were flaccid Treatment with neostigmine hydrochloride and aminoacetic acid was begun, but the infant died several weeks later On the basis of the history and postmortem examination, Cunningham stresses that in this case of clinically diagnosed amyotonia congenita (Oppenheim) the important changes were confined largely to the voluntary muscles and the central nervous system The cause of death was bronchopneumonia and possibly asphyxia resulting from an impaired swallowing reflex. There was also a healing Ghon tubercle and an enlarged thymus The muscles showed varying percentages of small embryonal muscle spindles with preserved cross striations and easily demonstrated Krause's and Hensen's membranes, together with some entirely normal muscle The central nervous system showed depletion in the number of motor ganglion cells in the anterior horns of the cord and diminution in size and distortion of the remaining ganglion cells The anterior roots were diminished in size and had faulty or absent myelinization There was no demyelinization of the tracts in the spinal cord and no evidence of involvement of pyramidal tracts of the cerebral cortex

**Substitution of Thymine for Folic Acid**—Spies and his workers point out that thymine (2, 4-dihydroxy-5-methylpyridine) has long been recognized as an integral portion of the biologic cell occurring as part of nucleic acid but early attempts to find its place in human nutrition by the administration of small quantities were without positive results Snell and others demonstrated that thymine could replace folic acid as a growth factor for lactic acid bacteria provided other known essential substances, including adenine, guanine or xanthine, were present. Stokes later suggested that folic acid acts as an enzyme or coenzyme in the synthesis of thymine or a thymine-like compound which is used by the bacteria to form nucleic acid and that offering of large amounts of thymine alone enables this material to be used "directly as a building block," folic acid no longer being needed for growth It appeared to the authors that Stokes's hypothesis might be a basic biochemical concept. One patient with macrocytic hyperchromic anemia in relapse, who had a persistent histamine refractory achylia and achlorhydria, was selected for trial with large doses The patient was given 500 mg of thymine orally twice daily for six days There was no change in her condition after this period, and the dose was increased to 2 Gm. thrice daily for a period of fourteen days A peak reticulocytosis of 14.2 per cent was reached on the eleventh day of treatment with the large dose Concomitant with this response there was general subjective improvement and appreciable decrease in symptoms The bone marrow reverted from that of megaloblastic arrest to normal The authors suggest that these observations although they were made in only 1 case, are of sufficient interest to warrant this preliminary report The results suggest that a concept basic in bacterial physiology may be widely applicable as a fundamental biochemical principle.

**Leiomyosarcoma of Stomach**—Schindler and his associates observed gastroscopically 4 cases of leiomyosarcoma of the stomach They also collected 94 cases of gastric leiomyosarcoma from the literature The three cardinal findings in leiomyosarcoma are (1) gastrointestinal hemorrhage leading to anemia, (2) epigastric or left upper quadrant pain and (3) an upper abdominal mass Each occurred in about 50 per cent of the collected cases. The first of the 4 patients had been treated for pernicious anemia but x-ray examination revealed large tumor masses and polyposis was suggested. The same diagnosis was made at gastroscopy The possibility of malignant tumor was considered and a biopsy specimen taken at an exploratory laparotomy revealed leiomyosarcoma. In the second patient acute hemorrhage led to hospitalization At the first x-ray examination the tumor was overlooked Gas

troscopy revealed the presence of the tumor At surgery a leiomyosarcoma was found growing expansively into the omentum and pancreas Total gastrectomy with extirpation of the spleen and the tail of the pancreas led to a cure. The third patient presented the picture of pernicious anemia X-ray examination and gastroscopy revealed a circumscribed tumor of the upper third of the stomach without gastritis In the gross resected specimen this tumor was found to be a pedunculated one but only at microscopic examination was the diagnosis of leiomyosarcoma made The tumor was removed by extensive resection and the patient survived The fourth patient had had severe attacks of hematemesis and melena for over a year Surgery revealed an intramural leiomyosarcoma Total gastrectomy with splenectomy and partial pancreatectomy was performed but the patient died from massive pulmonary atelectasis The authors conclude that the x-ray diagnosis would have been possible in 3 cases and that correct gastroscopic diagnosis should have been made in 3 The preoperative diagnosis of leiomyosarcoma of the stomach is possible X-ray treatment of gastric leiomyosarcoma is ineffective. Surgery proved to be satisfactory

**Composite Free Grafts of Skin and Cartilage from the Ear**—Brown and Cannon say that sections of the border of the ear containing two surfaces of skin with cartilage in between have been successfully transplanted as free grafts and defects of the nostril border tip and columella have been repaired satisfactorily in a single operation This procedure results in a better appearance than any other method and there is minimal deformity of the donor site and the use of bulk flaps is avoided. The ear can be repaired with a local flap or by burying the open ear under a direct scalp flap from behind and freeing it and grafting the defect two to three weeks later The procedure is useful for tissue losses from burns, gunshot and shell fragment wounds as well as other traumatic or operative losses

**Subcutaneous Heparin in Frostbite**—Lange and Loewe state that animal experimentation substantiated the fact that the timely use of heparin prevents gangrene whereas control untreated animals uniformly develop gangrene. The subcutaneous heparin preparation in the Pitkin menstruum seemed uniquely applicable and the authors used it on human volunteers. This method of depositing heparin achieves a consistent, retarded and equal release of the anticoagulant. The Pitkin menstruum which was designed to regulate the rate of release of water soluble drugs is composed of gelatin dextrose, glacial acetic acid and water The contents of the ampules are liquefied in hot tap water, drawn up through a 2 to 2½ inch, 18 gage needle into a 5 or 10 cc. syringe and injected subcutaneously preferably into the anterior or lateral aspect of the thigh The injections are given every day or every other day, and the average dose is 300 mg of heparin Occasionally 400 mg is required Eight volunteers were exposed to small areas of frostbite with the use of solidified carbon dioxide. None of them developed tissue loss when treated with subcutaneous heparin while the control lesions showed central necrosis.

**Electrolytic Absorption of Bone Due to Stainless Steels**—The cases reviewed by Key indicate that there is danger of electrolysis when different types of stainless steels are used He reproduces roentgenograms of the hips of patients in whom there was so much resorption of bone around the screws and under the plate that full weight bearing was not permitted until the Neufeld nails and screws had been removed, the cavities in the bones had partially filled in and the bone increased in density to a point where it was believed that unrestricted weight bearing could be undertaken with safety Under present conditions it is necessary for the surgeon himself to be responsible for the quality of the prostheses which he uses for the internal fixation of bone In the light of what is known about the deleterious effect on bone of electrolysis caused by the use of metals of different composition for internal fixation it is suggested that only stainless steel of a uniform composition be chosen for all prostheses which are to be used for the internal or external skeletal fixation of bone.

**Colloid Cyst of Third Ventricle**—According to Wilson, the rare lesions of the third ventricle, variously known as colloid, paraphysial or neuroepithelial cysts, arise from the velum transversum of the anterior part of the roof of the third ventricle from an embryonic anlage of the paraphysis A man aged 24, admitted to the neurosurgical service of the Charleston General Hospital Aug 12, 1940, had been subject to bouts of generalized headache for the past three years Often when stooping over to pick up an object he would become blind and dizzy for a few moments Headaches had become much more frequent during the past nine months Ventriculography revealed dilated lateral ventricles without shift, indicating a midline tumor completely obstructing the left foramen of Monro and almost completely obstructing the right The tumor appeared, therefore, to be in the anterior portion of the third ventricle A right frontal craniotomy was performed. As soon as the right foramen of Monro was exposed, a smooth, grayish glistening mass was seen presenting through the foramen This was grasped with tissue forceps, and a small piece, the size of a tear drop, came off without bleeding The margins of the foramen were incised, the foramen was enlarged, and the complete tumor, the size of a cherry stone, was delivered without hemorrhage. The postoperative course, while somewhat stormy, was satisfactory The patient was able to return to his work and in 1943 was ordered for induction

**Penicillin Sprays and Upper Respiratory Tract Infection.**—Knott and Blaikley made cultures from the nose, throat and skin of all patients and members of the staff in the maternity department with a view of minimizing the entry of streptococcic and staphylococcic infections and excluding carriers. Having first observed the course of bacteriologic events for about a year, they put into operation a preventive routine, continuous cultural control being maintained as before. The incidence of sepsis was reduced but at the expense of exclusions, particularly among nurses and students. In the hope of getting infected persons back to duty more quickly nose and throat spraying with penicillin was started. During the two years of routine spraying the persistence of micrococcus carrier infections has been reduced by about 50 per cent.

**Dosage of Ephedrine in Asthma and Emphysema.**—Herxheimer found that, while some asthma patients are highly sensitive to the customary ¼ to 1 grain (16 to 65 mg.) of ephedrine, many patients with bronchial asthma and emphysema are insensitive to them, especially the severely affected ones in a chronic asthmatic state. These patients often react well to high doses of 2 to 3 grains (0.13 to 0.2 Gm.) and without any toxic symptoms or signs. This is shown by the immediate increase of the vital capacity, the frequent disappearance or diminution of the rhonchi and the subjective relief. Ephedrine tolerance is acquired quickly. If it is given three or more times daily it loses its effect soon—often after three to four days. If the dose is increased then, the higher dose will have the same effect as the former small one. If a patient has become tolerant to a certain dosage and the drug is omitted, he will regain his former response to this dosage usually after three to four days. An intermittent treatment with the primary effective dose is therefore suggested. It may play an essential part in the rehabilitation of these patients, who usually are regarded as invalids.

Social Medicine in Old Age. T. H. Howell.—p. 399

**Penicillin in Subacute Bacterial Endocarditis.**—The 147 patients with subacute bacterial endocarditis who are the subject of Christie's report were treated with penicillin in fourteen research centers appointed by the clinical trials committee. The penicillin was given either by three hourly injection or by continuous intramuscular infusion. Both methods should be available if the treatment of subacute bacterial endocarditis is to be undertaken. Of the 147 patients, 50 have died and 81 have been apparently cured, but the systems of dosage used at first were inadequate. If the administration of penicillin is continued for ten days or more almost any system of dosage will occasionally produce excellent results. In previously untreated patients a 0.5 mega (million) unit daily for twenty-eight days has given better results than any other system of dosage employed, 11 of 18 patients receiving this treatment remained cured. From the evidence available it is safer to assume that inadequate treatment is prejudicial to later success. Relapse is more likely to occur if treatment is not both prolonged and intensive. Increased dosage is no substitute for prolonged treatment. Short courses of treatment, of ten days or less, are usually followed by relapse within a few days. Even after long courses most relapses occur within thirty days of cessation of treatment, a 0.5 mega unit daily for six or eight weeks is the system of dosage recommended for patients who have relapsed. The resistance of the infecting organism (146 patients were infected with streptococci and 1 with a strain of Hemophilus influenzae) as measured by ordinary titration methods appeared to be of no clinical importance within a wide range. Only when the organism was more than ten times as resistant as the standard Oxford staphylococcus did this measurement appear to be of therapeutic and prognostic significance.

**Primary Cancer of Lung in Childhood.**—Dick and Miller report a case of primary cancer of the lung in a girl aged 9 years. A single metastasis in the left femur caused symptoms eight months before the pulmonary lesion was recognized. Roentgenologic examination of the left femur revealed destruction of the upper end of the femur extending toward the shaft. The cells of the removed necrotic bone material could not be identified with certainty on microscopic examination, but the lesion appeared to be neoplastic. A roentgenogram of the chest did not reveal any evidence of a bronchial neoplasm. High voltage roentgen treatment was applied to the femur and the process seemed arrested. Eight months after the patient was first seen she was readmitted complaining of cough, headache and vomiting. The first impression was that she had secondary deposits in her right lung causing massive effusion. Aspiration of the chest revealed a small quantity of blood stained fluid which contained a few lymphocytes and some endothelial cells, there was no evidence of neoplastic cells. Roentgen therapy to the chest was carried out for ten days, but the patient died within twelve days of the treatment. The postmortem revealed that the primary lesion which had remained unrecognized for eight months, was a bronchial carcinoma and the lesion of the right femur was secondary.

**Thyroidectomy in Acute Thyrotoxic Myopathy.**—Sheldon and Walker report that a woman aged 50, with acute hyperthyroidism, muscular weakness and bronchiectasis, was treated with iodine but did not improve. This was followed by a course of neostigmine, which greatly improved her muscular power, but her general condition continued to deteriorate. As a last resort partial thyroidectomy was performed and treatment with iodine and neostigmine was continued, with the result that the patient recovered rapidly and has remained in good health for fifteen months after gradual discontinuance of the neostigmine.

**Possible Role of Anterior Pituitary in Diabetes.**—Gray and Oakley made studies on 7 elderly obese patients with mild diabetes, 13 young persons with diabetes, 3 patients in whom diabetes proved resistant to insulin and 3 patients with pituitary disease. They have been unable to find evidence that the plasma of elderly obese patients with mild diabetes contains a pituitary

like substance which inhibits the hypoglycemic action of insulin The presence of such a substance cannot be demonstrated even when five times the volume of plasma used in the original experiments is injected Normal depression curves may follow the injection of plasma from insulin resistant diabetic patients and from patients with acromegaly and Cushing s syndrome. The incidence of definitely positive results in this series is so low (two in sixty curves) and so inconstant in any 1 case that no conclusions can be drawn about their significance

**Treatment of Hemophilus Influenzae Meningitis** —North and his associates discuss the treatment of children with Hemophilus influenzae meningitis at the Children s Hospital Melbourne and the Royal Alexandria Hospital for Children Sydney Of 157 children of all ages who did not receive specific treatment, 2 (1 2 per cent) recovered of 150 who were treated with sulfonamides, 32 (22 per cent) recovered of 81 who were treated with sulfonamides in conjunction with Hemophilus influenzae, type b rabbit antiserum 46 (56 8 per cent) recovered Recovery under treatment was more frequent with each year of age The worse prognosis in very young children was probably due to delay in the commencement of specific treatment resulting from late diagnosis, in consequence of the difficulty of recognizing meningitis early in very young children without resorting to lumbar puncture It was possibly due also to the absence of natural antibody from the blood of young children and to their relatively poor immune response to infection. One of the sulfonamides should be given. A bacteriologic diagnosis should be urgently sought and specific antibody contained in rabbit serum should be injected as soon as the diagnosis is reached.

**Chronic Carbon Monoxide Poisoning** —According to Duvoir and his associates drivers of motor vehicles are particularly exposed to carbon monoxide poisoning so that for them chronic carbon monoxide poisoning is really an occupational disease Garage employees also are exposed to this type of intoxication Repeated examinations of men with chronic carbon monoxide poisoning revealed that the carbon monoxide persists in the blood for a considerable period Hematologic examinations are of little value in the detection of chronic carbon monoxide poisoning, but the extraction and analysis of carbon monoxide in the blood are satisfactory The use of Truffert s apparatus for this purpose has the disadvantage of requiring the withdrawal of about 30 cc. of blood. A satisfactory apparatus for microextraction is now available and a micromethod has been devised which gives encouraging results

Anthelmintic Action of Phenothiazine (Thiodiphenylamine) and of Its Derivatives R Deschiens —p 53

**Hypophysis and Glaucoma** —Jayle and Schachter studied the arterial tension in 45 cases of chronic glaucoma Three of the patients were less than 40 years of age, 22 patients were between 41 and 60 and 20 patients were over 60 There was 1 patient with hypertension in the first group and there were 15 in the second group and 18 in the third group Hypertension was present in 75 5 per cent of the patients There was 1 patient with hypotension and 1 patient with normal arterial tension in the first group, 7 patients with normal arterial tension none with hypotension in the second group, and 1 patient with normal arterial tension and 1 with hypotension in the last group Hypotension was present in 4 45 per cent of the patients with glaucoma and normal arterial tension in 20 per cent. As hyperfunction of the hypophysis is usually associated with pronounced hypertension, e. g in Cushing s syndrome the degree of hypertension in this syndrome was compared to that associated with glaucoma By using a biometric formula the degree of hypertension characteristic of glaucoma was determined to be $16 \pm 3\,03$ whereas that of Cushing's syndrome was $18 \pm 3\,15$

Euphoria Identical with Mania in Korsakoff's Psychosis. R Benon —p 65

**Regional Ileitis** —Rachet and his associates report a case of regional follicular ileitis in a man aged 32 Roentgenologic examination revealed a shrunken and threadlike terminal ileum. Excision of 60 cm of the ileum appeared justified post-

operatively, since examination of the removed portion revealed an isolated lesion of 2 cm. situated in a normal intestinal segment at a distance of more than 20 cm. above the terminal portion The anatomic changes consisted in hypertrophy of Payer's patches, some of which were ulcerated, there was considerable thickening of the submucosa with involvement of its lymphatic system and the corresponding mesentery Inflammation of the lymphatic system is to be considered as the starting point of the disease. Localization in the ileum presents only one variety of a disease which may involve the appendix, the cecum or a part of the ascending colon The disease is always associated with a mesenteric lymphadenitis It is therefore suggested that the follicular enteritis may invade from without the intestinal mucosa by a pathologic process which acts at a distance in the mesenteric area. Recovery resulted from the surgical treatment in the authors' case. No definite therapeutic recommendations can be given for acute cases of ileitis, since death may result if surgical treatment is omitted, but spontaneous recovery may likewise occur

*Delivery of Twins at Maternity Hospital of Geneva from 1934 to 1943 R de Siebenthal —p 288

**Twin Births**—A review of 142 twin pregnancies observed at the Maternity Hospital of the University of Geneva, Switzerland reveals that there was 1 twin birth for every 83 deliveries Dystocia was frequent, obstetric interventions being necessary in 52 per cent of the twin births This explains at least in part the greater fetal mortality and maternal morbidity, the latter being twice as frequent as in ordinary births Although cephalic presentations predominated the second twin was born only half the time in such presentation, there being a high percentage of breech and shoulder presentations in the second twin. The second twin appeared to be at a disadvantage It seems to de Siebenthal that the position of the second twin might become modified by the delivery of the first. The fetal prognosis depends particularly on the weight of the twins and on the interventions necessary during delivery Twins of low viability are especially sensitive to interventions The author advises systematic artificial rupture of the second bag of waters and immediate manual removal of the placenta, if it is not expelled normally If after spontaneous delivery of the first fetus the delivery of the second is delayed, intervention is advisable after one hour's waiting Should delivery of the first twin require intervention the second one should be delivered in twenty-five minutes Whenever delivery of the second twin requires intervention, manual removal of the placenta should follow at once. The author recommends Bracht's method for breech delivery

**Thyroid and Sensitivity to Intravenous Injection of Alloxan.**—Martinez administered alloxan intravenously to young white rats in which hyperthyroidism had been produced by the administration for twenty days of thyroid powder (20 mg per hundred grams of body weight) The animals were more sensitive to the intravenous administration of alloxan than were controls, whereas thyroidectomized animals were more resistant to intravenously administered alloxan than the controls The medium lethal dose ($LD_{50}$) was 25 mg for the rats with hyperthyroidism, 54 mg for the controls and 74 for the thyroidectomized animals

**Action of Alloxan on Islands of Langerhans in Rats**—Di Pietro inoculated rats intraperitoneally with different doses of alloxan and killed them at varying intervals Microscopic changes could be detected twenty-four hours after intraperitoneal injection, whereas after intravenous injection they were evident after one hour or less There was coagulation necrosis of the majority of beta cells but little change in the alpha cells and acinar tissue Proliferative changes were observed in the centroacinar cells and intracanalicular ducts seventy-two hours after injection There was a shrinking of the islets, the remaining beta cells were mostly degenerated and some of the remaining normal ones showed mitotic signs These destructive and proliferative changes were followed by a duct hyperplasia which gave rise to 'duct islets" Cell differentiation of these duct islets developed alpha and beta cells Overstimulation of beta cells brought about their exhaustion, followed by necrosis, the alpha cells remaining uninfluenced. This raises the question of whether the alpha cells represent an intermediary stage in the evolution of beta cells, as maintained by some authors, or whether they are specialized cells with a specific function, as maintained by Lane.

*Liver Changes in Surgical Conditions L Efskind —p 81

**Liver Changes in Surgical Conditions**—Efskind reports changes in the liver cells of 120 patients with severe disorders of the intestinal tract. Microscopic alterations were pronounced in patients with disturbances of nutrition of long duration, in those with hypoproteinemia and anemia and in patients with disorders of the liver and the bile ducts These changes occur at places of predilection in the liver lobules and are accentuated after serious operations Normal livers may, after extensive surgical intervention, present the same changes but to a minor degree. Abnormal mobilization of the liver glycogen occurs first, mitochondrial changes of regressive nature next, interstitial lymphocytic infiltration sometimes with fibrosis follows and fat infiltration of the liver cells results The changes in the liver cells appear early and are most pronounced in the central portions of the lobules the fat infiltrated cells may often be well supplied with glycogen and frequently maintain their glycogen deposit after severe operative trauma, probably as the result of some kind of cellular blockade, whereas the intact liver cells may be entirely depleted of glycogen. A normal glycogen content has likewise repeatedly been seen in the author's cases of chronic icterus and of considerable degenerative changes in the liver cells

Poliomyelitis in Mothers and Newborn K Palmstierna —p 1778

**Cardiac Infarct**—Riis studied 100 cases of cardiac infarction. The disease as a rule affects older persons occurring somewhat less frequently in women than in men in whom it appears at an earlier age. It may occur in relatively young persons Hypertrophy of the heart is common Coronary sclerosis was present in over 80 per cent of the cases hypertension in 63 per cent The mortality was 55 per cent One third of the patients died during the first three days Pain as the most important symptom occurred in 50 per cent of the patients, cardiac decompensation in 25 per cent, abdominal symptoms, pulmonary symptoms and collapse in 25 per cent Mortality increases with age. Syphilitic aortitis gives an unfavorable prognosis the prognosis is also grave in diabetes Persisting albuminuria with circulatory failure aggravates the prognosis In 7 of the necropsy cases no anatomic explanation for the infarct was found, in 13 cases with arteriosclerosis the lumen in the coronary arteries was patent.

Physiologic Points of View on Circulation During Pregnancy G Liljestrand —p 1852
Heart Disease and Pregnancy G Nylin —p 1855
Studies on Virus in Influenza and Sequels G Lofstrom —p 1867

**Hypertensive Conditions and Retinopathy** — Berglund discusses types of retinopathy which are accompanied at least during a part of the course by severe hypertension The hypertensive disorder in which changes in the retina are especially important is essential hypertension Ophthalmoscopy is valuable in distinguishing malignant from benign hypertension. After sympathectomy the retinopathy at times regresses almost completely This improvement is contrasted with the equally complete but transient regression sometimes attained by prolonged rest in bed and sedatives

**Regional Calmette Abscess**—Rekling studied 24 cases of regional adenitis after Calmette vaccination Abscesses occurred in 20 These sequels may affect the axillary and the supraclavicular and infraclavicular lymph nodes, sometimes several groups simultaneously From one month to two years have elapsed between the local infection and appearance of the adenitis from six weeks to three years between vaccination and development of the abscess, from two and a half to thirty-eight weeks between vaccination and recovery, from one to eight months between appearance of the adenitis and recovery All the abscesses were cold abscesses The chronic course and indolent character pointed to a tuberculous infection. Tubercle bacilli of BCG type were cultivated from pus from 2 of 14 patients, no common bacteria were found In 2 cases the hilus was affected The occurrence of erythema nodosum in 2 sisters, 1 infected with BCG vaccine, the other with tubercle bacilli of human type, supports the view that erythema nodosum is independent of the type or virulence of the tuberculous infection The course was uneventful in all cases Treatment should be conservative as long as possible

**Amino Acid Therapy**—Wretlind describes a method of preparation of an amino acid for intravenous administration Amino acid therapy is indicated in all cases in which the body cannot obtain albumin in the usual way Nitrogen and protein balance can be thus maintained In the prematurely born and in infants the treatment brings about rapid increase in weight and improvement in the general condition It is valuable in the treatment of hypoproteinemia

**Antistreptolysin Titer in Glomerulonephritis**—Weekly determinations of the antistreptolysin titer were made in 106 patients with acute and chronic glomerulonephritis The titer was increased in all but 6 of the 78 patients with acute glomerulonephritis, in 3 of the 6 there were hemolytic streptococci in the fauces, and 1 probably had a syphilitic nephritis Of the 28 patients with chronic glomerulonephritis only 4 had an increased antistreptolysin titer, 2 with values only up to 200 Lundbæk concludes that acute nephritis is almost always a sequel of an infection with hemolytic streptococci and that antistreptolysin determinations are an aid in differential diagnosis between acute and chronic nephritis

**Antistreptolysins in Acute Glomerulonephritis** — The antistreptolysin titer of the blood in the 36 cases of acute glomerulonephritis treated in 1944 repeatedly showed definitely increased values in 25 The Hansens discuss the importance of these tests in diagnosis, therapy and prognosis The antistreptolysin production should be followed by regular determinations of the titer, the variations in the antistreptolysin concentration indicate the course of the infection. In acute glomerulonephritis after an infection with hemolytic streptococci the prognosis is usually good, while nephritis without demonstrable preceding infection or after infections not due to hemolytic streptococci generally becomes chronic. In cases of repeated infection with hemolytic streptococci removal of the focus is advised.

# Book Notices

**War Neuroses** By Roy R Grinker Lt Col M C and John P Spiegel Major M C Army Air Forces Cloth Price $2 75 Pp 145 Philadelphia & Toronto Blakiston Company 1945

During the Tunisian campaign the authors experimented a great deal with sodium pentothal in acute war neuroses and found it a gratifying method of treatment The drug would quiet the patients and would allow the expression of many of the patients' fears and anxieties which they could not express otherwise This method of treatment—the principle of which was well known previously—was named by the authors narco synthesis, and the monograph describes their experiments with it Over 70 per cent of the men treated were returned to some form of useful function, even though most of them were not returned to combat

This monograph was the first major publication on war neuroses and their treatment and in the fall of 1943 the volume was distributed by the Army to its medical officers as well as to prominent psychiatrists in this country The subject is presented simply and lucidly The language is clear and concise, and the description of the clinical pictures of acute war neuroses, especially in the air forces are vivid and dramatic. The whole presentation is so 'smooth' that the whole problem of neurotic reactions in warfare appears easy, which unfortunately it isn't but since the book was really intended to be a sort of manual, a certain amount of dogmatism is permissible

There is a certain lack of discrimination in the descriptions of the vicissitudes of the ego, as if it were a concrete object, and the specific effects of sodium pentothal may also be questioned, since experimental data are lacking, but these are minor faults in an otherwise excellent presentation of a timely and important subject

**The Herbal of Rufinus** Edited from the Unique Manuscript by Lynn Thorndike Professor of History Columbia University New York assisted by Francis S Benjamin Jr Cloth Price $5 Pp 478 Chicago University of Chicago Press 1946

The publication of this volume has been aided by a grant from the American Council of Learned Societies from a fund provided by the Carnegie Corporation of New York and by a grant from the William A Dunning Fund of Columbia University ' Thus again the debt of Science Art and Letters to their generous patrons is increased

The book is composed of Thorndike's introduction of 33 pages, a transcription of De Virtutibus Herbarum of "Master" Rufinus, of 439 pages and 35 pages of indexes prepared by Professor Thorndike himself

In the introduction Thorndike gives, in his usual somewhat pedantic style, his reasons for performing this arduous labor only a single manuscript of Rufinus is known to be extant, and this of course, may be lost or destroyed at any time, to deprive the world of an important source of added knowledge of medieval botany and medieval medicine Again, the book of Rufinus introduces us to a hitherto unknown version of Dioscorides and affords also a corrective to future critical editions of other early medical literature Moreover the philologist will discover here a mine of material in late Latin and the early vernaculars —no mean consideration, by the way, as any student of the history of medicine knows

There follows a series of paragraphs concerning the life and work of Rufinus and his relations to his predecessors and contemporaries, and good reasons are given for the conclusion that Rufinus did not know the De Vegetabilibus et Plantis of Albertus Magnus Rufinus indeed gives his sources of his own accord, viz Dioscorides, the Circa Instans, Macer, Alexander, the Salernitans, Isaac and the Synonyms The text of De Virtutibus Herbarum follows and Professor Thorndike has had the great foresight to include the foliation with recto and verso indicated Unfortunately, Thorndike's own critical notes have been sprinkled into the body of text on the page instead of being placed properly at the bottom of the page beneath a horizontal line Since several fonts of type have been used in the transcribed original text, the addition of still another for editor's notes within the text itself adds considerably to the reader's vexation This, coupled with the barbarity of the language and with the crudity and usual inconsistency of the spelling of the scribes (which Thorndike has rightly preserved) renders the book extraordinarily difficult The Herbal of Rufinus is not for casual reading or for the library of the dilettante It was not intended to be. The vast quantity of sheer toil which the editor and his assistant have expended to produce this work is apparent on every page and in virtually every sentence. So also is the vast quantity of knowledge prerequisite.

The text has been reproduced entirely, even to Rufinus's own Tabula Rubricarum et Capitulorum, which attempts a semblance of alphabetical order This Tabula, however, is nearly useless to the purpose of the modern student, recognizing this Thorndike himself has prepared a series of indexes of great value one of herbs, simples and compound medicines, one of diseases and parts of the body affected, one of measures instruments and utensils, a fourth of the names of persons and titles of anonymous works and finally one of names of places The usefulness of the book to the student, the investigator, the historian, the critic, has been enhanced incalculably through this work

**Hipertensão arterial Patologia clinica e terapêutica** Pelo Professor Genival Londres Diretor do Instituto de cardiologia Com a colaboração dos doutôres J Pulcherio Filho Joaquim Brito Nelson Cotrim Roberto Segadas e Silvio Abreu Fialho Fabrikold Pp 572 with 116 illustrations Rio de Janerio Livraria Agir Editôra 1945

Dr Londres has written a large and impressive book chiefly concerned with the clinical aspects of arterial hypertension The first portion of the work describes the physiologic aspects of blood pressure and includes the usual data found in most good textbooks of physiology An excellent chapter follows using coarctation of the aorta to illustrate 'central" resistance to blood flow as opposed to peripheral resistance. A not too critical one by Segadas on the clinical forms of hypertension leaves the reader with the feeling that there is still much room for accurate bedside observation. The chapter by Fialho describing the *fundus examination* is distinctly above average, as are the chapters of Filho on radiography Cotrim's too short chapter on the electrocardiogram probably would not give the reader an adequate understanding of the subject The surgical treatment is written by Brito He takes those to task who do not credit this form of treatment to the Italian surgeon Pende. The 'Peet' operation of supradiaphragmatic resection becomes the Pende operation Like so many chapters on this controversial subject the analysis is not deeply penetrating The good and the careless statistics are given equal value. The final chapter is by Londres on medical treatment and seems excellent.

This book, along with the older book of Castex, serves a useful purpose in that it covers for South America somewhat the same material covered by Fishberg for North America though scarcely as effectively A defect in the book aside from lack of balance among the various chapters is the inadequate reference to the literature. Many references are included in the text but are either wrongly referred to in the bibliography or not referred to at all Both these defects could be easily remedied.

This seems a good book which should serve well the South American physician of more than usual industry and intelligence a book which may well grow in importance during succeeding editions

**The 1945 Year Book of Industrial and Orthopedic Surgery** Edited by Charles F Painter M D Orthopedic Surgeon to the Massachusetts Women's Hospital and Beth Israel Hospital Boston Fabrikold Price $3. Pp 432 with 220 illustrations Chicago Year Book Publishers 1946

This book, as heretofore, represents an excellent compilation of the year's orthopedic and industrial literature The abstracts are concise and give a good idea of what is contained in the original articles The book is profusely illustrated with clear reproductions of x rays and figures About sixty periodicals are represented in the abstracts, including a fair number of foreign publications It appears that a larger representation of articles from the *Journal of Bone and Joint Surgery* might have been possible The tremendous literature which resulted from experience in military installations might well fill a year book of itself, and yet relatively few articles have been abstracted from this source On the whole, however, this collection of abstracts represents a good ready reference for a variety of subjects of orthopedic and industrial interest.

# Queries and Minor Notes

THE ANSWERS HERE PUBLISHED HAVE BEEN PREPARED BY COMPETENT AUTHORITIES THEY DO NOT HOWEVER REPRESENT THE OPINIONS OF ANY OFFICIAL BODIES UNLESS SPECIFICALLY STATED IN THE REPLY ANONYMOUS COMMUNICATIONS AND QUERIES ON POSTAL CARDS WILL NOT BE NOTICED EVERY LETTER MUST CONTAIN THE WRITER'S NAME AND ADDRESS BUT THESE WILL BE OMITTED ON REQUEST

## FREQUENCY OF CESAREAN SECTION

*To the Editor*—In a medium sized general hospital in which there are about 600 obstetric deliveries a year what should the percentage of cesarean sections be? We have about 4 5 per cent cesarean sections Our neonatal deaths including stillbirths are about 4 per cent Are these excessive?

A L Barbrow M D Homestead Pa

[This inquiry was referred to two authorities in the field whose respective replies follow—EDITOR ]

ANSWER—The incidence of cesarean section varies widely in different institutions somewhere between 2 and 5 per cent. A large teaching maternity hospital recently reported an incidence of 4.28 per cent during the last several years (Dieckmann William J *Am J Obst & Gynec* **50** 28 [July] 1945) The small maternity service which draws its patients from a local restricted community should have a low rate The small rural hospital serving a large area would admit necessarily more patients with complications resulting in a higher rate Likewise the large teaching hospital to which many patients with complications are referred for treatment and delivery would have a higher incidence of abdominal delivery If the hospital in question serves a wide area and the number of patients with complications is high a cesarean rate of 4 5 per cent can be justified

A neonatal and stillbirth rate of 4 per cent compares favorably with many institutions provided all babies weighing more than 1 500 Gm are included in the figures

ANSWER—At the Johns Hopkins Hospital for a period of twenty five years the incidence of cesarean section was reported as 1 7 per cent These figures included all patients admitted among whom were many colored women with the high ratio of contracted pelvis common to the Negro race

Stander has stated that the cesarean section rate for any maternity clinic should not exceed 4 per cent In private practice the incidence is about 1 per cent

The neonatal death rate at present in well conducted obstetric clinics should be expected not to exceed 3 per cent This figure includes all stillborn infants as well as those dying from any cause within the first two weeks after birth

## PLASMA AND AMINO ACIDS FOR BURNS

*To the Editor*—Would giving amino acids orally and intravenously take the place of giving plasma in burns? How much amino acids would be necessary to replace 250 cc. of plasma?

Edwin Epstein M D Birmingham Ala

ANSWER—The administration of plasma in burns is planned to fulfil two needs of the patient One of these needs would not be satisfied to any degree at all by amino acids the other need would actually be better met by amino acid administration than by plasma These needs are

1 Early (up to forty-eight hours) in the course of any serious burn there is an extensive loss of plasma from the blood stream into the burned tissues and to the outside in the form of weeping This loss is so extensive as to account in a large part at least, for the resultant oligemia and decrease in blood flow and cardiac output (Blalock) that accompanies the shock syndrome of burns This syndrome begins at the time of the burn and is the major cause of death during the first forty eight hours Since protein containing plasma is lost plasma or other quickly assimilable protein should be replaced as soon as possible in amounts commensurate with the loss Amino acids would require synthesis to protein to supply this lack and there just isn't time for this to be done soon enough for a therapeutic effect It is true however, that whole blood (Moyer Evans) which contains plasma and albumin which contains one of the two chief protein constituents of plasma can be substituted for the latter during this stage Furthermore if the sodium needs of the burned victim are adequately met (Rosenthal Fox), less plasma (or whole blood or albumin) is necessary but the fact remains that amino acids are not a substitute for plasma at this stage

2 During the later stages (second week time of healing) any unhealed burn becomes a nutritional problem particularly with regard to protein balance This problem remains as long as a granulating surface exists, hence the need for early grafting At times as much as 300 Gm of protein a day is necessary (Co Tui, Levenson) If the patient is able to take enough nourishment by mouth, amino acids or any other suitable form of protein are adequate If supplemental parenteral nourishment is necessary, essentially only three substances are available whole blood, plasma or amino acids As far as the relative merits of plasma and amino acids are concerned the question is largely a financial one In some cases 2 liters or more of plasma would be needed every day for weeks which would involve an outlay of thousands of dollars if commercial plasma was used Amino acids are much cheaper and are of practical value in these large amounts

Two hundred and fifty cc of citrated plasma contains no more than 12 5 Gm of protein Two hundred and fifty cc of 5 per cent amino acid solution (the strength usually given) also contain 12 5 Gm of protein and consequently is equal in action to the same volume of plasma in supplying the protein needs of the body where speed of action is not essential

## ELECTROENCEPHALOGRAPHY

*To the Editor*—1 What types of electroencephalographs are available? What is the relative ease of operating the different models? 2 Are there textbooks of electroencephalography? 3 What postgraduate courses of electroencephalography are available?

O L Bendheim M D Phoenix Ariz

ANSWER—1 A committee has been organized by the American Medical Association to pass on standards for electroencephalographic equipment. At present, however it is only fair to point out that the adequacy of apparatus is in almost inverse proportion to the amount of advertising done by manufacturers

2 The only complete textbook on electroencephalography in English is that of F A and Erna L Gibbs (Atlas of Electroencephalography Cambridge, Mass, Addison-Wesley Press) An authoritative chapter on electroencephalography by Herbert Jasper is to be found in Epilepsy and Cerebral Localization by Wilder Penfield and Theodore C Erickson. The value of electroencephalography to the psychologist has been considered in detail by Donald Lindsley in Hunt's Personality and Behavior Disorders New York, Ronald Press 1944 A manual for technicians has been written by R S Ogilvie Manual of Electroencephalography for Technicians (Cambridge, Mass Addison-Wesley Press Inc. 1945)

3 Postgraduate courses in electroencephalography have been given by the Neurological Institute New York, the University of Pennsylvania and the University of Michigan A three weeks course in electroencephalography is scheduled for June 3 to 29 1946 by the Department of Psychiatry University of Illinois Medical School A notice of this course is to be found in THE JOURNAL May 18, 1946, page 243

## OTOSCLEROSIS AND PREGNANCY—INHERITANCE OF OTOSCLEROSIS

*To the Editor*—I should like some information regarding the subject of pregnancy and otosclerosis From the literature and particularly recently there seems to be little evidence that we need to consider a therapeutic abortion on those having this condition Is there any hereditary factor present in the offspring of a mother having otosclerosis?

C P Whalen M D Kankakee Ill

ANSWER—The adverse effect of pregnancy on hearing in cases of otosclerosis has tended to be exaggerated in the textbooks Nevertheless about one out of four pregnancies occurring in otosclerotic women results in a definite acceleration of the hearing loss Since the fenestration operation now offers a reasonable chance of regaining serviceable hearing it is questionable whether therapeutic abortion would be indicated

There is a strong hereditary tendency in otosclerosis When both parents are afflicted, the children are almost certain to become deafened but if only one parent is afflicted, the children will not always develop impaired hearing

## ATTACKS OF UNCONSCIOUSNESS

*To the Editor* —A man aged 67 a farmer who grew up in the Swiss Alps began having fainting spells two years ago which would be preceded by a feeling of tension in the region of the fifth cervical vertebra This feeling would be referred to the occiput and the patient would suddenly drop unconscious or remain seated staring straight ahead On being placed in a horizontal position he would immediately regain consciousness and feel normal and act apparently normally with no after-effects and any pallor he had would disappear from his face These attacks would occur as often as three times during a meal Examination revealed a healthy appearance with good color and fresh clear skin moderately thickened radial arteries and palpable pulse in the dorsal pedis arteries heart sounds were normal urinalysis gave negative results the systolic pressure was 120 diastolic 78 all reflexes were equal and sufficiently active, the Kahn test was negative The cardiographic report stated that there was evidence of moderate damage due probably to coronary artery disease On the basis of my diagnosis of cerebral anemia due to arteriosclerosis I administered vasodilators in the form of nitrites by mouth and nicotinamide and deproteinated pancreatic extract parenterally with considerable palliative improvement His attacks continue however though at much greater intervals and recently he has developed a weakness in the legs which threatens to make an invalid of him I would like any suggestions you may be able to offer regarding further study and treatment in this case?

Ewart S Sarvis M D Sumas Wash

Answer —The suggested diagnosis of cerebral vascular disease is a most likely one However, the possibility of a central nervous system lesion of some other sort cannot be ruled out by "reflexes equal and sufficiently active" One must consider narcolepsy and epilepsy A central nervous system neoplasm would seem to be a good possibility This seems the more likely with recently developed weakness in the legs A hyperactive carotid sinus reflex is a more remote possibility At any rate a thoroughgoing examination of the nervous system is indicated. This should include an examination of the fundi an examination of the spinal fluid if there is no contraindication and encephalography if available An electrocardiogram at age 67 that shows "evidence of moderate damage due probably to coronary artery disease is not especially significant

## PENICILLIN TREATMENT OF SECONDARY SYPHILIS

*To the Editor* —A boy aged 15 was attacked by a naval officer who had anal relationship with him Several weeks later the boy had a mild rash which the family thought was due to acne Subsequently swelling and pain developed over the left clavicle with fever and rectal bleeding On examination he had enlarged glands in the axilla a palpable spleen a diffuse macular rash and some tender nodes felt rectally Syphilis was considered but the boy denied any type of exposure X ray of the clavicle showed a periostitis Peripheral blood study and bone marrow puncture ruled out infectious mononucleosis or blood dyscrasia Aspiration of a lymph node was negative. Dark field examination of scrapings of a skin lesion showed spirochetes The Wassermann reaction was reported positive The Kahn reaction originally reported doubtful was also positive Afterward the boy admitted exposure He was given a total of 6 000 000 units of penicillin within ten days first 40 000 units every three hours then 100 000 units every three hours His Wassermann reaction decreased from 32 units to 16 units within one week The rash and the periostitis disappeared and he is apparently well Should the boy now be considered cured and no further therapy given or should he get additional oxophenarsine hydrochloride or a bismuth compound and if so for how long and in what dosage?

M D New York

Answer.—There have been an insufficient number of cases of secondary syphilis treated with a total dosage of 6 million units of sodium penicillin given at three hourly intervals over a period of eight to ten days to give an accurate estimate of the likelihood of cure in a case such as that described Future therapy would depend to a large extent on the availability of such information

Some comment which may be of value, however, can be given, based on existing knowledge of other dosage schemes

Secondary syphilis treated with a total dosage of 2 4 million Oxford units given 40,000 units every three hours for sixty injections will have an anticipated cure rate of between 80 and 90 per cent When semi-intensive arsenotherapy with one of the phenarsine derivatives is employed simultaneously with the penicillin course the anticipated cure rate is considerably higher (Moore, J E, and others The Journal, Sept. 9, 1944 p 67 Eagle, Harry, and others *Ven Dis Inform* 27 3 [Jan ] 1946 Schock, A G, and Alexander L J The Journal, March 16 1946, p 696) Satisfactory information is not available as to the results when the arsenic-bismuth course follows the penicillin therapy It would not be anticipated that any short or substandard course would be of great value.

Increasing the total dosage or the amount per individual injection of sodium penicillin in the treatment of syphilis as in the case presented, does not greatly increase the anticipated cure rate within the range of 1.2 to 4 0 million Oxford units total dosage. It is always best to give maximum dosage, however since penicillin as at present available, is a mixture of several salts of different potency and is far from standardized for the treatment of syphilis Increasing the total number of injections by decreasing the interval between injections to two hours instead of three hours or by prolonging the course of treatment, will result in a higher anticipated cure rate. Thus, treatment given over a ten day period, as in the present instance, would be expected to give better results than if given over the more standard seven to eight day interval but this could not be expressed in absolute percentage terms

In summary, the anticipated cure rate in the present instance would be at least 80 per cent and, because of the somewhat larger than standard dosage given over a slightly longer period might be better than 90 per cent If post-treatment observation can be maintained regularly, no additional therapy but rather monthly physical examination and blood serologic tests for the next year, would seem to be the principal immediate indication, with a spinal fluid study shortly after six months Normally the blood serologic test should become negative between the third and the ninth month and remain so If there is clinical evidence of relapse or progression, if the blood serologic test does not become negative or reverts to a sustained positive after an initial negative response, or if the spinal fluid study is positive, then additional treatment is indicated and should be considered. This treatment should be individually and expertly planned. It could consist in retreatment with penicillin or in the institution of a standard course of chemotherapy with a phenarsine derivative and a bismuth preparation or a combination of an arsenical and penicillin. Retreatment should be carried through as for a new case, as though no previous treatment had been given, using maximum dosage

## WEATHER AND VASODILATATION

*To the Editor* —Is there any information available on the effect of atmospheric pressure changes on the blood pressure and if so what is that effect and how much? I have made a few observations and it does seem to me that blood pressures are higher when barometric pressures are high and vice versa I have also noticed many times in people whose veins are prominent on the back of their hands that these veins stand out much more prominently at times of low barometer while when the barometer is high they are much smaller and more threadlike Could this mean that low barometric pressure acts as a vasodilator? Could there be anything in the old saying I feel tough today it must be the weather"? Any information on this subject will be greatly appreciated

Charles B Rohr M D Alum Bridge W Va

Answer.—The relationship of weather to illness and physiologic activity has been studied most exhaustively by William F Petersen (The Patient and the Weather, in 4 volumes, Ann Arbor, Mich, Edwards Brothers, 1934 to 1945) It is reported that the incidence of coronary occlusions rises with changes in barometric pressure Fluctuations in the intensity of discomfort in arthritic patients are definitely correlated to changes in barometric pressure Changes in environmental temperature are reflected by the arterial tension Cold causes the pressure to rise because of peripheral vasoconstriction. The cold pressor test of Hines and Brown utilizes this phenomenon as a basis for measuring the reactivity of the vasomotor apparatus There is considerable variation in the intensity of response between different individuals, excessive reactivity to cold implies a sensitive, labile, hyperreactive vasomotor mechanism and is strongly suggestive of future hypertension Hyperreactors are potential hypertensives

Heat is an effective temporary vasodilator There are many observations to the effect that the arterial tension is lowered during spells of hot weather A relaxing hot bath reduces the arterial tension considerably, though only temporarily Weather does affect the feeling of well-being, but just how the effects are brought about is not yet clear

## SUBJECTIVE VISUAL SENSATIONS

*To the Editor* —A man aged 43 an Arabian complains of red vision for about fifteen minutes on awakening each morning at 4 o clock with frontal headache The patient has been in the United States about twenty years He is employed as building superintendent About two years ago he had a recurrence of malaria and was successfully treated with atabrine and quinine In July 1945 his blood pressure was 120/80 the urine acid with a specific gravity of 1 030 and 1 to 2 pus cells occasionally blood hemoglobin is 89 per cent red blood cell count 4 900 000 and white blood cell count 5,500 The Wassermann reaction is negative The red vision" has persisted for the last eight months The fundi and conjunctiva seem to be normal each time I examine him Kindly advise as to diagnosis and treatment

Martin H Greenfield M D Brooklyn

Answer —Subjective visual sensations occur in a great variety of forms, including color Generally, special significance need not be attached to them Of course there is always an explanation, even if one is not able to find it The important thing is to differentiate sensations that are significant of some important pathologic process and ignore the others

The frontal headache is another matter That may be of ocular origin and calls for examination of refraction and motility It is possible that ophthalmoscopic study would show cause for the red vision.

## CONGENITAL HYPERTROPHIC PYLORIC STENOSIS

WILLIAM E. LADD, M.D., PAUL F. WARE, M.D.
and
LAWRENCE K. PICKETT, M.D.
Boston

Congenital hypertrophic pyloric stenosis has been written about frequently and its treatment has become moderately well standardized, nevertheless in the series of over a thousand cases that have occurred in the Children's Hospital, situations have arisen which either are not emphasized in the literature or are in need of clarification. It should be noted that this report deals with patients operated on by various members of the surgical visiting and resident staff.

The mortality of this disease in any children's hospital should not rise above 1 or 2 per cent. To attain such a result requires attention to the details of preoperative and postoperative care as well as to the operative technic. One should also be on the alert for complications or the occasional associated anomalies.

In 1939 Ladd and Gross[1] reported a series of 765 cases of pyloric stenosis treated in this hospital. In 1933 Lanman and Mahoney[2] had reported 405 of these cases. The present report deals particularly with an additional 380 patients operated on between 1939 and 1945.

### ETIOLOGIC FACTORS

Many factors have been reported to bear a causal relation to congenital hypertrophic pyloric stenosis. These have been repeatedly observed and confirmed by numerous observers, but it is still impossible to assess their true significance and the exact role they play.

*Sex.*—Males predominate in all reported series. In our hospital approximately 85 per cent of the cases occurred in male infants. No one has ever offered a satisfactory explanation for this overwhelming incidence.

*First Born.*—Pyloric stenosis is reported to occur more frequently in the first born of a family, averaging 50 to 60 per cent of cases in most series. Our own figures bear this out as our patients represented first births in approximately 55 per cent of cases.

*Race.*—We have noted no particular racial disposition in our series. While it is true that certain countries report fewer cases it seems likely that this is due to nonrecognition of the cases rather than to a smaller incidence. We have never observed a case in a Negro infant, although this is apparently pure chance, as Donovan[3] reports about 2 per cent of his cases to be in Negroes, while figures from the Charity Hospital in New Orleans[4] show 30 per cent of their cases occurring in Negro babies.

*Heredity.*—Families with the disease present in several siblings or found in successive generations are not infrequent. We have encountered one set of identical twins each with pyloric stenosis. Reports from the literature would indicate that this disease has never been reported in only 1 of 2 identical twins. Pyloric stenosis has also been reported in stillbirths and in a seven months fetus. These are all strong arguments in favor of a hereditary factor but no satisfactory explanation has ever been advanced as to exactly what this factor is.

### PATHOGENESIS

We have found no one of the various theories of pathogenesis completely acceptable and believe a combination of views necessary to explain the salient features of pyloric stenosis.

1. The presence of the pyloric tumor at birth is generally agreed on, and indeed its occurrence has been reported in premature infants and stillbirths.

2. Work hypertrophy is the second factor of interest. The views of Lehman (quoted by Szilagyi and McGraw[5]) are interesting in this regard. He believes that work hypertrophy results as the pyloric muscle attempts to overcome a resistant sphincter.

3. Pylorospasm is the third factor to be considered.

4. We feel that the combination of pylorospasm and a work hypertrophied pyloric tumor together with edema of mucous membrane from the mechanical irritation of the curds best explains the clinical picture of congenital hypertrophic pyloric stenosis. The onset of symptoms (usually between the second and fifth weeks), the severity of the vomiting and the ultimate development of complete pyloric obstruction are directly related to the degree of hypertrophy present in the individual case. The role of these factors may be depicted in an occasional case by barium swallows at intervals, showing a progression of changes from the early normal pyloric canal to the gradual narrowing and lengthening as work hypertrophy occurs and eventually showing the roentgenographic picture of advanced pyloric obstruction. Such a series of roentgenograms correlate definitely with the clinical picture

From the Department of Surgery, Harvard Medical School and Surgical Service, the Children's Hospital.
Dr. Ladd is William E. Ladd professor of child surgery emeritus, Harvard Medical School and surgeon-in-chief emeritus, the Children's Hospital. Dr. Ware is assistant in surgery, Harvard Medical School and resident surgeon, the Children's Hospital. Dr. Pickett was formerly surgical intern, the Children's Hospital.

of a baby with normal feeding habits at first, then the gradual onset of regurgitation, and finally the explosive projectile vomiting of severe pyloric obstruction

### PATHOLOGY

The essential changes in pyloric stenosis are limited to the pylorus itself. Other pathologic variations are purely secondary and are related to the obstruction present with resultant starvation.

Grossly the pylorus is seen as a spindle shaped, olive sized mass with a pale glistening serosal surface. On palpation the tumor is cartilaginous in consistency, extends for varying distance onto the gastric wall and ends abruptly on its duodenal end. In postmortem specimens the interior of the pyloric canal is almost completely closed by folds of mucous membrane, with a sharp termination of the stenosis at the duodenal end.

Microscopically the important finding is a tremendous hypertrophy of the circular, smooth muscle layer together with an actual increase in the number of smooth muscle fibers. Sections of the mucosal layer reveal edema and a slight leukocytic infiltration.

### SYMPTOMS AND SIGNS

*Dehydration.*—Since the majority of patients with pyloric stenosis are 4 weeks of age or more when first seen, the evidences of dehydration are usually well defined. The infant is thin and wizened looking, with almost no subcutaneous fat and with the skin falling in folds. The eyeballs may be soft, the fontanel sunken and the infant feverish. The mother will frequently volunteer that the baby voids infrequently.

*Vomiting.*—This symptom usually appears in the second or third week of life. Vomiting is at first merely regurgitation and at infrequent intervals. As the obstruction becomes more complete, the baby vomits explosively after almost every meal. However, the child is continually hungry and will feed eagerly even immediately after vomiting. The vomitus never contains bile, although in late cases it may contain old blood due to edematous gastric mucosa.

*Weight.*—As vomiting continues, the child at first fails to gain in weight and then later there is actual weight loss. At the time of operation the infant is usually below his birth weight.

*Scanty Stools.*—These babies do not suffer from constipation, but rather as the obstruction progresses there is less and less fecal residue and the babies pass small, hard, dry, constipated looking stools. If these infants have diarrhea, it is a symptom of serious import.

*Alkalosis.*—Prolonged vomiting or misguided gastric lavage may lead to a huge loss of electrolytes with hypochloremia, and the infant may show severe alkalotic respirations, general hypertonicity and even convulsions. Fewer babies in such a condition are being seen as the diagnosis is made earlier and earlier.

*Peristaltic Waves.*—These may be seen best during feeding. Waves may be noted to pass from left to right, across the child's epigastrium, increasing in volume as more and more feeding is taken and ending abruptly as the child vomits projectilely. While abdominal patterning may be seen occasionally in undernourished babies, the huge waves present in patients with pyloric stenosis are characterized by appearing only in the epigastrium.

*Pyloric Tumor.*—Palpation of an olive sized mass in the right upper quadrant is the most important finding for confirming the diagnosis. The infant should be fed to afford relaxation. One should not confuse the pole of the right kidney with the tumor. We have palpated a definite tumor in over 98 per cent of cases. The percentage of cases in which one can successfully palpate a tumor is directly related to the number of cases one has an opportunity to examine, to the method of palpation and to the patience of the surgeon. The ideal moment for the successful palpation of the tumor is immediately after the infant has vomited.

### LABORATORY DATA

The red blood cell count and hemoglobin values are essentially normal in these babies. Determinations should not be done until after the baby is hydrated, as otherwise one may be misled by the hemoconcentration present. Urine examination is usually negative except for the presence of acetone due to ketosis. The serum protein is frequently a low normal value after hydration, but for some reason these infants rarely show a nutritional edema. In the occasional alkalotic baby the serum chloride is of some importance, and its level is directly related to the severity of the child's obstruction. Formerly, plasma and vitamin C determinations were made and found to be uniformly low.

### ROENTGENOLOGIC EXAMINATIONS

The more facile one becomes in palpating a pyloric tumor, the fewer will be the indications for roentgen confirmation of the diagnosis. A plain film of the abdomen may be of no value if the baby has just vomited. The administration of a thin barium mixture is therefore desirable in obscure cases but not without danger, owing to the possibilities of aspiration. If examination shows almost complete retention, a tube should be then passed and the barium removed.

The essential roentgen features of diagnosis are (1) gastric dilatation, (2) intermittent hyperperistalsis, (3) a greatly elongated pyloric canal which is only 2 to 3 mm. in width and (4) delayed gastric emptying time. Retention of over 75 per cent of a barium meal at the end of three hours indicates definite pyloric obstruction.

### DIFFERENTIAL DIAGNOSIS

*Pylorospasm.*—The status of pylorospasm as a distinct clinical entity we do not propose to discuss at length. However, there is a definite group of cases that resemble classic pyloric stenosis babies very closely. Whether their symptoms are due to "pylorospasm" or to mild forms of organic stenosis we do not know. In any case there are clearcut differentiating points.

A detailed history in such babies will reveal a classic intermittence of symptoms with varying intervals of well-being. Hypertonicity is present but responds well to sedatives and antispasmodics. An occasional case may show all the obstructive symptoms of a pyloric stenosis, but generally they have a milder course. In addition, the onset of symptoms is usually later and there is no male preponderance.

*Infectious Vomiting.*—Infection as the cause of the baby's symptoms may be easily ruled out by a careful physical examination. Diarrhea is apt to be present, and also fever and leukocytosis. Again, the symptoms are relatively mild and of course there is no palpable tumor.

*Improper Feeding.*—Infants often develop complaints comparable to pyloric stenosis shortly after leaving the

obstetric ward Careful analysis should therefore be made of the amount type and actual mechanics of the feeding Careful feeding by a competent nursing staff for two or three days will often completely resolve the child's difficulties

*Intracranial Injury*—The symptoms of babies with intracranial hemorrhage usually date from birth They vomit without relation to feeding, may be cyanotic, fail to nurse, convulse and show an irregular pulse and respirations Lumbar puncture reveals grossly bloody spinal fluid Subdural hematoma resulting from intracranial injury frequently causes vomiting, convulsions, irritability and stupor, but these symptoms usually become evident later than in babies with more diffuse hemorrhage Subdural taps reveal excessive xanthochromic fluid Xanthochromic fluid or blood clearly differentiates intracranial injury from pyloric stenosis

*Chalasia*—We have recently begun to recognize a new symptom complex for which the word chalasia of the esophagus has been suggested by Dr Edward B D Neuhauser[6] of our x-ray department These babies vomit persistently but lack other signs of pyloric stenosis The condition may be definitely differentiated from pyloric stenosis by roentgenologic examination which shows the gastric cardia in a state of continuous relaxation with frequent regurgitation of the barium which has been given Babies with this difficulty respond well to a therapeutic test of thickened feedings while they are kept in Fowler's position

*Extrinsic Intestinal Obstruction Malrotation*—A malrotated colon causing duodenal obstruction may show peristaltic waves in the epigastrium The vomiting may be explosive, but the vomitus will be bile stained and no tumor can be palpated Under such circumstances a roentgenologic examination should be made to reveal the true diagnosis

*Volvulus*—A volvulus may be present in cases of malrotation Again, the onset is early, the vomitus is bile stained and a roentgenogram is helpful In the presence of a strangulating obstruction, differentiation is not difficult

*Intrinsic Intestinal Obstruction*—Duodenal stenosis is the only type which may be confusing Usually the symptoms date from birth, the vomitus is bile stained, no tumor is palpable and a barium meal offers considerable assistance

### PREOPERATIVE CARE

Pyloromyotomy should never be regarded as an emergency procedure The aim in every case should be to restore the baby to as nearly normal a nutritional state as possible before operation Correction of dehydration, ketosis and low chlorides by adequate fluid therapy are as important as surgical skill in lowering mortality rates in this condition Two or three days of preparation with parenteral fluids should be the minimum, and occasionally in cases of long standing with severe obstruction five to six days of preparation may be necessary before the baby is a suitable operative risk

In general, one should maintain the infant's fluid intake at 2½ to 3 ounces per pound daily In this clinic two intravenous infusions and two subcutaneous clysses are given daily Five per cent dextrose in water, 10 cc per pound of body weight is given intravenously and isotonic solution or half isotonic solution of sodium chloride in 2 5 per cent glucose, 15 cc per pound of body weight, is given subcutaneously

In the poorer risk debilitated patients with long-standing obstruction and malnutrition, whole blood transfusions raise the serum protein level and in addition bring the red blood cell count and hemoglobin values to satisfactory levels Plasma protein transfusions improve the general condition of the patient and materially aid wound healing The amounts of plasma and whole blood given correspond to 10 cc per pound of body weight One hundred mg of vitamin C given twice daily in the clysis fluid will restore rapidly the depleted plasma vitamin C level of these babies Normal serum protein levels and adequate vitamin C therapy encourage a well healed wound

Amigen solutions either intravenously or subcutaneously offer still another source of increased protein intake in such babies Full formula feedings are maintained during the preoperative period regardless of the vomiting in the majority of cases, as small amounts of feeding will be absorbed We have been gratified in a few cases to have infants retain a fair proportion of a feeding consisting of equal parts of 10 per cent amigen and 10 per cent glucose in the face of decided pyloric obstruction

### TREATMENT

It is almost the universal consensus that surgical treatment is the treatment of choice This opinion has been held at the Children's Hospital since 1915

### PREPARATION FOR OPERATION

Conservation of body heat is a primary consideration in these debilitated infants The extremities are wrapped in several layers of sheet wadding, and the baby is pinned to the operating table with a hot water bottle under his back to provide heat and improve operative exposure The temperature of the operating room should likewise be carefully regulated The skin of the abdomen is cleansed with ether followed by half strength tincture of iodine and the exposed surface quickly draped A small urethral catheter is passed down through the nose and the stomach contents are aspirated The catheter is then left in place during the operation to deflate the stomach, which improves respiration and facilitates anesthesia

### ANESTHESIA

Premedication consists in the administration of atropine sulfate in appropriate doses Barbiturates and morphine are unnecessary and perhaps dangerous Open drop ether is used almost routinely in this clinic, and it has proved to be eminently satisfactory Relaxation is excellent, with no danger of evisceration, and in the hands of expert anesthetists leaves little to be desired If one experienced in infant anesthesia is not available, probably local procaine infiltration of the abdominal wall is the method of second choice We have found this method satisfactory for a small number of patients who are particularly bad risks If used as a routine, however, its disadvantages are likely to be only too apparent The operative procedure is prolonged, relaxation is poor, and sudden straining or crying of the infant may result in evisceration of the intestine with its attendant difficulties and shock

### OPERATIVE TECHNIC

A great variety of abdominal incisions have been employed by different surgeons Formerly, most of our cases were done through a right rectus wound How-

6 Neuhauser E B D Personal communication to the authors

ever, in the past five years the gridiron incision of Robertson [7] has been the approach of choice in this clinic Some men prefer a high midline incision Meredith [8] varies the right rectus by transversely opening the posterior rectus sheath and peritoneum and Davis [9] has recently advocated a transverse incision through the skin, subcutaneous tissues and anterior rectus fascia, longitudinal splitting of the rectus muscle and a transverse peritoneal opening

The gridiron incision is made 2 inches in length parallel to and one fingerbreadth below the costal margin, starting at the lateral edge of the right rectus muscle and is then extended laterally Careful hemostasis is practiced and subcutaneous bleeders are tied with silk (0000 or 00000 in size) The external oblique and internal oblique muscle layers are then divided in the direction of their fibers and the transversalis muscle and peritoneum opened transversely as one layer With the liver edge retracted, the antrum of the stomach presents and the pylorus is easily delivered into the wound Occasionally it is necessary to palpate the tumor and then "milk" it into the wound with the right index finger A ½ to ¾ inch incision through the serosa and superficial musculature is then made on the relatively avascular superior anterior surface The incision should continue onto the gastric wall but should stop just short of the duodenal end of the tumor The bulk of the hypertrophied muscle may then be divided bluntly with the scalpel handle The blades of a hemostatic snap are then inserted into the incision in the pylorus and opened This separates the remaining muscle fibers and allows the mucosa to pout above the level of the serosa In this part of the procedure the main problem is to separate completely the muscle of the duodenal end without opening the lumen of the duodenum Occasionally oozing is encountered from the pyloric incision, which usually can be controlled by pressure with a warm saline pack The release of traction on the stomach will also relieve the engorgement of the vessels and reduce troublesome bleeding to a minimum Rarely it may be necessary to ligate a persistent bleeding vessel

The pylorus having been returned to the abdomen, the peritoneum and transversalis layer are closed with a continuous suture of 0000 chromic catgut Each muscle layer then is sutured with interrupted 00000 silk and the subcutaneous tissues and skin are approximated with the same suture material The infant is then wrapped in warm blankets, thoroughly suctioned and rebreathed with oxygen for five to ten minutes, the stomach catheter is then removed and the baby is returned to the ward

## POSTOPERATIVE CARE

Occasionally it may be necessary to give an intravenous injection of glucose or plasma on the operating table but usually the postoperative fluids are deferred until the baby has returned to the ward

Many slightly different postoperative feeding programs have been successfully used for these babies by various men The following feeding regimen has been in use in this hospital for many years and has been completely satisfactory

Feedings are begun as soon as the baby is conscious, and fluid is given every two hours for the first thirty-six hours The composition of the feedings is roughly as follows and varied according to individual indications

2 feedings of 1 ounce of sterile water,
4 feedings of 1 ounce of whey,
4 feedings of ½ ounce of whey and ½ ounce of breast milk,
4 feedings, decreasing whey by 1 drachm and increasing breast milk by 1 drachm at each feeding, and
4 feedings of breast milk with 1 drachm increase with each feeding

This regimen covers the first thirty-six hours postoperatively and at its conclusion the baby is receiving 1½ ounces of breast milk every two hours Parenteral fluids are necessary during this period to supplement the baby's oral intake and fulfil the fluid requirement of 2½ to 3 ounces fluid per pound in twenty-four hours Occasionally a small amount of regurgitation may be noted during the first postoperative day but this is usually negligible in amount

The feeding schedule is now lengthened to three hours and the breast milk gradually increased to 2½ ounces per feeding If breast milk is not available, a 40 calory modification of water, karo and equal parts of whole milk and skimmed milk may be substituted When the stools and feeding habits are normal, a whole milk formula containing 50 to 55 calories per pound is substituted and after ten to fourteen days the interval between feedings may be increased to four hours

Postoperative transfusions of plasma and whole blood are given as indicated by the red blood cell count and the serum protein and hemoglobin values

The skin sutures are removed on the fifth and sixth postoperative days and the baby discharged home on the ninth or tenth day

Close follow-up visits are then made and the formula is adjusted as necessary until satisfactory and prolonged weight gain is assured

## COMPLICATIONS

*Duodenal Perforation* —In any large series of cases in which adequate pyloromyotomies have been done the duodenal mucosa may be opened in a few instances This is easily understandable in view of the abrupt termination of the hypertrophied muscle at its duodenal end and the importance of separating these distal muscle fibers if complete relief of the obstruction is to be accomplished

If this accident should occur, prompt recognition is essential, as otherwise a fatal peritonitis may result in these debilitated infants One may first notice a small area of pouted everted mucosa or slight bile staining or most often the escape of a few bubbles of gas

In over a thousand cases of pyloric stenosis in which operation has been performed during the past thirty years the duodenum has been accidentally opened twenty-three times Nine of these perforations occurred in the 380 cases seen between 1939 and 1945 Fortunately, in each case the perforation was noted and immediately closed The stomach mucosa was also opened once during this period There were no untoward results following perforation in any of these recent cases In patients operated on before 1939, three deaths occurred following perforation but only one of these was due to peritonitis

A perforation of the mucosa at the duodenal end of the pyloric tumor merely indicates that the incision has been extended too far In our experience the simplest and most effective repair is to close the incision by one or two sutures of fine silk at the duodenal end The indwelling gastric tube is placed on suction postoper-

7 Robertson D E Congenital Pyloric Stenosis Ann Surg 112 687 1940
8 Meredith E. W Pyloric Stenosis Pennsylvania M J 43 1686, 1940
9 Davis H H Right Rectus Gridiron Incision in Pyloric Stenosis Surg Gynec & Obst. 78 211 1944

atively for forty-eight to seventy-two hours and the baby maintained on parenteral fluids In the more recent cases sulfonamide therapy has also been given If the child's condition is satisfactory the tube is removed on the third or fourth postoperative day and routine pyloric feedings are started

*Otitis Media*—Otitis media has been a frequent complication, occurring in 24 cases in the past six years—an incidence of 6 3 per cent In 6 of these cases (25 per cent) both ear drums were involved Myringotomy was necessary in 5 instances The infection was presumably due to the frequent vomiting causing blocking of the eustachian tube orifices The occurrence of otitis media did not seem to affect the prognosis in any way

*Wound Infection and Evisceration*—There were 11 instances of wound infection in these recent 380 cases (3 0 per cent) In 2 cases evisceration occurred but successful resuturing was performed One child required a secondary herniorrhaphy but was then completely well All 3 of these cases occurred in right rectus wounds

*Pneumonia*—Pneumonitis was found as a complication in 9 instances In a 4 pound (1,815 Gm ) premature infant pulmonary infection apparently resulted from massive aspiration of mucus postoperatively and ended fatally In the remaining 8 cases whether infection was present preoperatively as the result of aspiration and accentuated by inhalation anesthesia or represented a postanesthetic pneumonitis could not be determined

*Malrotation*—Five cases of malrotation of the colon with duodenal obstruction were noted in this group of 380 cases In 3 cases the duodenal obstruction was recognized and repair of the malrotation was effected at the time of pyloromyotomy One of these 3 cases occurred in a 4 pound premature infant with congenital heart disease In the fourth case symptoms of duodenal obstruction became evident after the pyloric obstruction had been relieved In the fifth case operation was performed at 11 days of age for malrotation Four weeks later the cardinal findings of pyloric stenosis appeared and pyloromyotomy was carried out In all 5 cases a Ladd's procedure[10] was done successfully with complete relief of symptoms In 2 babies an incidental malrotation was found at the time of pyloromyotomy Since there was no evidence of duodenal pressure or obstruction no additional operative procedure was done

## OPERATIVE RESULTS

In this series of 380 cases of pyloric stenosis treated surgically there have been 4 deaths A brief report of each case together with the essential postmortem findings follows

J McC. a 4 pound 4 ounce (1,928 Gm ) premature infant with classic findings of pyloric stenosis associated with cyanotic spells, was otherwise normal Pyloromyotomy was performed Postoperatively the child had three severe cyanotic spells and died five hours after operation Postmortem examination revealed severe bilateral bronchopneumonia with aspirated gastric contents

S S, a 6 pound 6 ounce (2,898 Gm ) Mongol infant, was diagnosed as having pyloric stenosis The infant died eighteen hours postoperatively with a central nervous system type of respiratory arrest. Autopsy revealed numerous defects of the central nervous system together with anomalies of the kidneys and ureters

F B was operated on for pyloric stenosis The baby did well for five days and then developed an uncontrollable diarrhea On the ninth postoperative day he experienced severe cyanosis and labored respirations one hour following a blood transfusion Autopsy revealed pulmonary edema and a terminal bronchopneumonia due to aspiration

E W a 5 pound 12 ounce (2,608 Gm ) 3 week old infant who had an uneventful pyloromyotomy, began to show signs of intestinal obstruction on the third postoperative day with abdominal distention and bile stained vomitus Reexploration was planned, but the baby developed sudden respiratory distress and cyanosis and died suddenly a few hours before the scheduled exploration Postmortem examination revealed a stenosis of the ileum

The satisfying steady decline in mortality following pyloromyotomy at the Children's Hospital may be seen from the accompanying table In the past three and one-half years 225 consecutive cases of pyloric stenosis have been treated surgically without a fatality

*Decline in Mortality Following Pyloromyotomy*

| Year | Cases | Deaths | Mortality, per Cent |
|---|---|---|---|
| 1915 1935 | 588 | 35 | 5 95 |
| 1936 1945 | 557 | 5 | 0 89 |

## SUMMARY

1 One thousand one hundred and forty-five patients with pyloric stenosis have been operated on by various members of the Surgical Service of the Children s Hospital since 1915

2 Eighty-five per cent of cases occur in males and particularly in the first born of a family

3 The essential pathologic finding is hypertrophy of the circular muscle layer of the pylorus

4 The cardinal findings are (*a*) dehydration, (*b*) projectile vomiting, (*c*) scanty stools and urine, (*d*) visible gastric waves and (*e*) a palpable pyloric tumor

5 Proper fluid therapy is the most important aspect of preoperative care to lessen operative risk

6 Pyloromyotomy under ether anesthesia is the procedure of choice, preferably through a Robertson gridiron incision

7 Complications include duodenal perforation, otitis media and pneumonia, wound infection and evisceration or severe diarrhea

8 Operative mortality in 557 cases seen during the past ten years is 0 9 per cent Recently 225 patients with pyloric stenosis have been operated on consecutively without a fatality

**Possibilities of Cooperative Research**—One of the most striking characteristics of an expert investigator is his strong individualism He has his own personal curiosities, his own plans for work and his own ways and methods for carrying out his plans It is difficult for him to engage with other experts as a member of a team New ideas for research come to mind in the course of his investigation that enticingly lead him away to fresh fields for discovery He wishes to follow the prospects he foresees, unchecked by obligation to associates He acts thus not because he fails to respect or appreciate highly what others are doing but because he is satisfying an eager personal interest What proves attractive to him furthermore, may not prove attractive to others Indeed, it may be difficult for him to justify to others the course he intends to pursue—Cannon, Walter B The Way of an Investigator, New York, W W Norton & Co, Inc, 1945

# THE PERPETUATION OF NERVOUS DISORDERS BY ARMY PSYCHIATRIC PROCEDURE

CLAUDE UHLER M D
Dallas Texas

Psychiatry was prepared for World War II The previous twenty years had marked the golden age in psychiatric research and treatment Mental hygiene had reached actively into the community in close working relationship with educational, law enforcement and social welfare agencies Enlightenment on the nature of mental disease had opened the way to clinical observation in the schools and playgrounds State hospitals were clearing the umbrage of insanity Mental sufferers were submitting voluntarily to commitment under the assurance of early cure and continued respectability after discharge Conferences were dynamic with discussion about interpersonal relations, parents of nervous children, sibling rivalries, character dominance and the prevailing culture as causes of maladjustment Psychoanalytic principles had been incorporated into psychiatric thinking for an understanding of the psychologic mechanisms operating in the germination of mental disease Tests and questionnaires were prolific in the evaluation of aptitudes, emotional instabilities and personality trends Projective procedures were curtailing projections by the examiners Psychiatrists were "looking at" every discipline of personal influence Then the war came and with it the opportunity to look at the results of their labors

The Office of the Surgeon General had organized its staff of psychiatric consultants Psychiatry for the first time received equal recognition in rank with medicine and surgery At each of the service command headquarters a psychiatric consultant was appointed for the purpose of counsel and direction Psychiatrists were assigned to the staffs of the promptly constructed general and station hospitals Induction centers were staffed with the leading psychiatrists in the community Reception centers, replacement training centers and ports of embarkation had psychiatrists

Psychiatry was faced with a challenge Manuals and bulletins were hastily devised and distributed covering the classification and disposition of anticipated casualties The setup seemed to be perfect In the discussion which follows, attention is directed to some of the reasons for the failure of the Army to utilize the most skilled psychiatric talent ever assembled in one organization in the history of medicine

In the course of the first year the psychiatric problem was serious The numbers of cases taxed the experience of the examiners in the necessity for snap diagnoses and dispositions formulated to meet manpower requirements Many psychiatrists were assigned to general medical duties They became gradually more isolated in the field under the orders of their immediate command Wider became the gap between them and the headquarters which issued official psychiatric directives Disposition and CDD boards were cluttered with cases Patients were remaining on the wards from two to three months in no relation to condition or progress Many did not see a psychiatrist for weeks at a time Seventy per cent of the time of the psychiatrist on duty in the Zone of the Interior was consumed with clerical work and board meetings The outpatient departments had long rosters of "goldbricks" on sick call In the course of the remaining years of the war a drama of psychiatric debacle was unfolded which threatens to perpetuate mental invalidism for many years The incidence, the prolongation and the refractoriness of mental disease at the present time together comprise the indictment against Army psychiatric procedure

The enlisted men in a service unit assigned to a prisoner of war camp provide a rich harvest for psychiatric consultant work These men represent largely the "eight balls" in the Army, men who by reason of disability or inefficiency filter through a variety of assignments after repeated board appearances and periods of hospitalization to land in maintenance and repair, latrine orderly and guard duty over prisoners of war Seventy-two per cent of the enlisted strength claim chronic ailments which disqualify them for duty A psychiatric study of 380 men of this group reveals that 30 per cent of the total strength of the unit are unfit for duty of any kind in the military service

Among the three principal types of serious personality disorders, namely the psychoneuroses, the constitutional psychopathic states and the psychoses, the second type predominates There were few psychotics Many of the inadequate types of psychopaths were schizophrenic, but in the interest of quick disposition they were classified constitutionally inadequate The schizophrenic, like a chameleon, changes color from one hospital to another, and the disposition of his case is deferred The psychopath remains black on his record alone, and his disposition is perfunctory

These men were studied with attention to distinctly positive elements in the psychogenesis of each condition In accordance with official directive the principal psychiatric categories were prohibited by name in the case records In their place were substituted the complaint, the symptoms or descriptive paraphrases This official directive, by its evasion of positive diagnosis, resulted in confusion and misinterpretation among psychiatrists, internists and commanding officers alike, spread distrust for psychiatric nomenclature generally and placed the psychiatrist in the position of temporizer or an agent to maneuver dispositions to fit the occasion regardless of the diagnosis Symptoms and subtypes in the principal categories of nervous disorders blend imperceptibly without demarcation This fluidity was exploited mercilessly by official procedure so as to force the diagnosis to serve exclusively the military duties exacted of the soldier Accordingly, the diagnosis varied with the purpose of the examination and the pending requisitions, such as those in induction centers, reception centers, replacement training centers, combat zones and special service units This explains the wide disparities in the recommendations on the same man under different military disciplines Actually some paraphrase of psychoneurosis or psychopath or feebleminded or normal could be attached to the same soldier in agreement with the nature of the requisition which he had to be applied against, without regard for his fitness for those duties or for his own mental liabilities

The psychiatrist was prevented from exercising his trained judgment in the practical problems which confronted him Too frequently his opinion was accepted only when it supported the preconceived views of his commanding officer, a Regular Army physician, promoted to administrative authority at the outbreak of hostilities with no knowledge of psychiatry This is

exemplified in the statement of a commanding officer of a large station hospital "We had no psychoneuroses in World War I Where are they coming from now?" War manpower had to be served, to be sure It should not have been purchased, however, at the cost of more than one-half million mental misfits carried along for an indefinite period of six months to three years

Instructions and directives issued from time to time from the Office of the Surgeon General carried no applicability to critical problems in the various units Administrative psychiatrists operated for the most part only with other administrative branches of the service Clinical psychiatrists worked detached with little opportunity for independent action Psychiatry became an expediency and in some instances an additional military discipline bearing no semblance to a branch of medicine

Orders, in the form of "ground rules," to ignore the psychogenic factor in disabilities hampered treatment as well as diagnosis Even in the presence of organic changes conspicuous on physical examination a large portion of the disability may be of psychogenic origin In conditions where organic changes are not demonstrated it is reasonable also to suspect strong psychogenic influence, as in lumbosacral strain, neuritis, forms of arthritis, cardiovascular instabilities, angiospasms and gastrointestinal dysfunctions Psychosomatic medicine is not new Time and tradition establish psychoneurosis as illness, not an epithet Army psychiatry dropped this view and with it all the experience gained in this field from World War I Fortunately overseas units did not share this handicap

## ILLUSTRATIVE CASES

Case reports follow in accordance with standard classification The psychoneuroses comprise neurasthenia, anxiety states, conversion states, obsessive reactions and reactive depressions

A private aged 37, with three years' service, complained of an 'all in feeling and nervousness He had headaches and noticed that he was absent minded when he was given several orders at the same time Prior to military service he had been healthy working hard as a farm hand Overseas he contracted malaria, and for the past two years he had been admitted to hospitals with relapses of chills and weakness He complained of stomach trouble and felt short of breath even at rest. Sometimes he was too weak to sit up He had acquired a neurasthenic state secondary to the repeated hospitalizations which his original relapses required He declared vigorously that he would like to return to duty, but he was at a loss to know just what he was capable of doing The variety and vagueness of complaints with lack of energy, irritability and weakness distinguished this reaction from conversion neurosis This soldier received ten reassignments and transfers Each hospitalization period simply marked an interlude between transfers His final psychiatric diagnosis was interpreted as qualification for a prisoner of war camp assignment

In anxiety states there is a feeling of tension and anxiety dominating the soldier's reactions, changing in intensity from time to time in the same situation They are precipitated by fears and sudden shocks, loss of friends and relatives, marital upsets and feelings of guilt

A private aged 25 with two years and seven months service complained of headaches ear trouble and pains in the abdomen He did not mention nervousness at first He reluctantly admitted that he had been a little nervous all his life. He seemed to be ashamed of his timidity in childhood He was always very sensitive He cried when he was reprimanded by his school teacher He had been decidedly a home boy He went only with one girl since he was 16 years old and he was engaged to marry her He had been inducted on limited service because of nervousness He had been hospitalized five times for a total period of one year and three months On interview he choked and stuttered. He repeated "I'm giving you all the truth about myself I'm not trying to get out of anything I am not bucking for a discharge Religion is the only thing that holds me up I often pray for help I'll do anything they tell me to do but to tell you the truth for months at a time I have not been given anything to do"

Allowances were made for the soldier at every post He had been exempted from basic training, and subsequent assignments involved only light duty This soldier required no more of an emotional upset than separation from home and family to develop an anxiety state similar to that arising from fear and sudden shock in combat In this case also frequent reassignments as a substitute for psychotherapy led to a dependent invalid state His assignment to this camp exemplified the universal misundefstanding of psychiatric diagnosis

Conversion states are defense mechanisms against disappointments and conflicts where the original idea is repressed and the attendant emotion attaches itself to one special physical system resulting in some such defect as paralysis, convulsions, blindness or pain

A private aged 24, with five years' service, had a good previous work record and had adjusted satisfactorily before he was inducted He had rarely been sick He had thirty months overseas duty, with seven months' combat experience He was evacuated by rotation to the United States He had been hospitalized seven times for indigestion and pains in the stomach When he was shipped out from his last post he stated that he had been told that he was due to appear before a board in the hospital but that there was no empty bed at the time and maybe the next post would be able to take care of him For the past six months he had been losing weight He had weak tired feelings Since the date of cancellation of his board review he had had an aggravation of gastric pain and vomiting This was construed to be an attempt to evade duty Although he had been examined thoroughly for peptic ulcer he insisted that he had some organic condition which the doctors could not find. He had been transferred to three new posts since he returned from overseas Even though he had been hospitalized repeatedly, he had received no psychiatric disposition

A sergeant aged 26 with fifteen months service in the China-India-Burma theater of operations made a request to see the psychiatrist. He had a fear of being in crowds Since he arrived in the United States he had tried to avoid people on the sidewalks He thought that he was being stared at. He agreed that there was nothing logical in this feeling He did not think that he looked different from other persons He would walk four or five blocks out of his way down side streets to avoid crowds on the sidewalk He had been in isolated sections among the same men for months in the jungles of India He thought that perhaps this experience had something to do with his feelings in crowds at this time When he asked his commanding officer at his previous post if he could see a psychiatrist he was given K. P duty He was told that if he reported for sick call again he would be transferred. He gave the information that he was very sensitive in childhood He was fondly attached to his only sister Recently his sister began having fainting spells She was being treated by a physician three times a week with "some kind of body massage." He did not know what the treatments consisted of and both he and his mother had been trying to persuade her to see a psychiatrist He worried because his sister never told them much about the treatment He had always been curious 'about psychiatrists and the way they made people well' His sister never had an attack at home or when she

was alone but always among crowds on the street, in the movies or in stores It was precisely such places which created panic in him He believed that he needed a psychoanalysis The soldier's worry about his sister formed the basis for his phobia He accused himself for not being able to help her Whenever he received news about her he became more doubtful of her recovery He never noticed any nervous trouble of his own until his sister began having spells Fears for her health were displaced to a situation of his own unconscious creation, of identical locale, in the form of a phobia of crowds on sidewalks His interest in psychiatry came from a desire to help his sister by securing treatment for his malady, which bore a close resemblance to hers By identification, as he was cured he visualized his sister's recovery also

This soldier had received no psychotherapy "Goldbricking" had to be discouraged The scarcity of courts-martial for malingering attest to the success of this discipline And the price paid for it is the perpetuation of mental disease in thousands of genuinely disabled men

In reactive depression states a realistic chain of depressive circumstances is recounted, in logical and understandable sequence, of sufficient emotional significance to justify the reaction The resulting depression in spirits is not always manifested openly by tearfulness and agitation and is probably more disturbing in its suppressed forms with inner turmoil of emotion Soldiers with a reactive depression were dealt with harshly The noncoms had little tolerance for them They put them through toughening up tactics Credit is due them however for their intelligent interest and responsiveness when they could be contacted about individual cases Here the difficulty was that general hospitals carried no provision for contact with line officers, and communication was cumbersome In 1944 reconditioning centers were organized under station hospital administration too few and too late to salvage any material fit for duty from the chronic invalidism then prevalent The convalescent centers which grew out of this experiment provided the only facility for psychiatric treatment under official directive since the outbreak of hostilities Then the war was over

A private aged 23 had been in the service for six months assigned to the interrogation of German prisoners He stated that he had "been overworked, called to duty four times without sleep for fifty two hours" He was born and reared in Germany He had been exposed to the prevailing brutality in his community for several years before coming to this country He recited incidents of many beatings at the hands of the young Nazis at school He came to this country at 16 on the affidavit of his uncle, leaving behind a 10 year old sister He worked as a factory hand in a radio plant He made strenuous efforts to raise enough money to bring his sister also He heard reports of the suffering which was imposed on the Jewish families One week after he had deposited money in the bank to assure visa for his sister, war was declared and the United States consul left Germany Subsequently he read of the deportation of Jewish children to Poland, where they were placed in ghettos He got news from the prisoners at this camp about the wholesale mutilation and the incineration alive of the occupants of these ghettos, and the fate of his sister was constantly before him He became depressed and weak and did not have strength enough to complete basic training He was getting worse in the course of processing prisoners Examination revealed a reactive depression with anxiety and tension and hatred initiated by years of bitterness toward the Nazis for their inhuman practices He stated that he tried to do his duty in the compound as interpreter, but his contacts with the prisoners always revived memories of the suffering which they caused his family As he spoke he trembled and perspired and tried hard to choke back his sobs "It's my little sister that is always in front of me day and night She would be 16 now" These apprehensions produced a paralyzing state of depression which handicapped him for the most meager responsibilities

This soldier's assignment to a German prisoner of war camp cannot be justified by military necessity

A private aged 24, with four years' service, had spent forty months overseas He had a rigorous assignment in outposts, where he contracted malaria and "jungle rot" During his periods of best health his performance was so commendable that he was promoted successively to the grade of sergeant After returning to the United States by rotation he was assigned to military police duty He was directing traffic on his post when a woman drove her automobile through a formation as retreat was sounded He "flagged" her down and admonished her that if she did that again she would be taken to the provost marshal's office She was indignant and drove on A short time later he was admitted to the hospital for treatment of his "jungle rot" Here he received notice that he was demoted to the grade of private because of "discourtesy and misconduct" The woman had written to the commanding general that the soldier's insolence had caused her to have a miscarriage The soldier was then transferred to a prisoner of war camp Examination revealed a tense, anxious and depressed condition He stated "I'm scared—I never knew what it was to be afraid overseas but back here everything scares me—I can't sleep—I don't have any spirit—I try to do my guard duty but I can't even think—I don't have any life in me—I find myself crying without knowing what I am crying about" Although he did not speak about his demotion he exhibited suppressed emotion as he was questioned about it He strained himself to conceal his humiliation over the loss in grade He suppressed the idea itself, but feelings of remorse broke through periodically so that he cried "without knowing why"

After four years' service this soldier had his first interview with a psychiatrist at a prisoner of war camp

The constitutional psychopathic states are characterized by their noncompromising reaction These soldiers are unable to follow conventional rules and resist official standards of conduct Their records are marked by inefficiency, alcoholism and frequent disciplinary infractions

A private aged 29 had been in the service for one year without any assignment for the past six months because of inefficiency He had been taken out of basic training because he could not keep up At this camp he had led a desultory existence ineffective even for simple maintenance jobs At an early age he had been orphaned He was reared by an older sister He was a behavior problem in school, engaging in many fights After a series of misdemeanors he was committed to a reform school He never held a job more than a few weeks He was never self supporting In the Army he accomplished no more than he did in civilian life He would leave his duties and go to his barracks to lie down He left the post without a pass He received company punishments and court-martial He had been a drag on the training program from the time he was inducted Once while he was guarding prisoners he left to get a drink of water He thought it to be "all right because there was another guard at the end of the detail" This was the first occasion of referral to a psychiatrist for examination

A private aged 24 with two years and eight months service was referred because of neglect of his personal appearance and "senseless behavior" He would not shave unless he was ordered He was reported to be discourteous, impudent and insubordinate He became drunk "on a few beers" and had to be assisted to his barracks He never received a company punishment or court martial The family history revealed pathologic heritage. A maternal aunt was psychotic. His mother was epileptic His father was a chronic alcoholic addict, and all his father's relatives were vagrants He had

always been a problem He was ill tempered, flew into rages and resented correction At the same time he was timid among other boys, afraid to go out at night and always carried a knife He never held a job because he could not get along with his boss He was never able to support himself and yet he married three times As a soldier he was stubborn, disregarded orders and wilfully made trivial mistakes "to make the serg-ass sore' When he found himself about to get into trouble he went on sick call with weak eyes, painful feet and cramps He brought his wife to one of the dances at the Officers' Club to 'prove to her that the USO dances were better" During interview he was indifferent He tapped on the desk started to light a cigaret and wanted to chew gum He asked "What are you, a nut doctor? I'm crazy as Hell Say, could I get out if I went nuts?"

This soldier was constitutionally psychopathic It is interesting to note that, according to his own story, he enjoyed more independence and personal satisfaction in the military service than he did in civilian life His only complaint was that his wife needed more money He had never previously been considered a case for psychiatric study

In the asocial class of psychopath there is a conspicuous lack of consideration for the feelings and rights of others These men are irritable, arrogant and dishonest

A private aged 20, with two years' service, was referred from the stockade where he was awaiting trial for absence without official leave. He had a record of frequent such offenses He had two courts martial for assault The soldier came of good sturdy lineage of Southwest pioneers His father was a farmer of even disposition but firm and stoic in morals He was reared in a family atmosphere of inspiring devotion, which was reflected in the behavior of all the other five children He was nervous restless and ill tempered His mother told him that he was more trouble than all the other children put together He had never been ill in his life At 13 he viciously attacked his teacher He then ran away from home and roamed over the country He learned to drink among vagrants At 15 he had a bar room brawl and beat up three grown men He was sentenced to six months in a reform school At the end of thirty days he was released on the provision that his parents remove him from the state He returned in a few weeks He was arrested six times for drunkenness Three days after he was inducted he was absent without official leave After his last court-martial he was released by transfer to a staging area He received a delay en route, overstayed his leave and landed in the guard house. In the course of the psychiatric interview it was revealed that he had never been able to get along with his father although he admitted that he was always treated kindly He was childishly attached to his mother He hated to see his father come home from work He would not admit any ill feeling but he recalled that he always wanted to leave when his father was around the house

In his reaction this soldier represents an arrested emotional growth, remaining at a mother fixation level, with resistance against identification with the father Subsequently every disciplinarian became a father image which he freely attacked He had never previously been referred for psychiatric study

Mental deficiency is a form of constitutional psychopathic state in which the principal handicap for the performance of duty is inaptitude Screening at the induction centers eliminates the seriously defective Illiteracy is not itself indicative of mental deficiency There were twelve illiterate soldiers at this camp Three were seriously feebleminded, assigned to guard duty

A private aged 23, with two years and six months' service, was referred because of fainting spells Two sisters had epilepsy One was confined as psychotic to a state institution The soldier had never attended school His only job was railroad track repair At 16 he began having attacks of unconsciousness On one occasion he fell and rolled down an embankment, receiving cuts and bruises He stated that he told his sergeant that he had spells but the "sergeant said that he had spells too" He was court martialed at his first post for having whisky in his possession on guard duty He explained, 'The guy that was coming on duty next told me to take it so it would be there when he came on" Another time he was "chasing" prisoners past headquarters and failed to salute the general 'He was busy talking I did not think he saw me' He stated that at his last prisoner of war camp he did guard duty every other day and "stayed drunk all the time" He had spells about three times a year This was his first hospital admission

This type of behavior is typical of mental deficiency The case is complicated by epilepsy His lack of responsibility, indifference to correction and untrainability are in line with his level of intelligence This case typifies the career of ten mentally defective soldiers referred for examination because of noneffectiveness One mental defective has been carried along for four years with repeated reassignments from latrine and orderly room work to guard duty who is illiterate, has a disabling stutter and cannot urinate in the presence of other soldiers

Chronic alcoholism was present in many of the psychopathic states It is an expression of neurotic character or mental disease In Army procedure it is not so considered The term is used exclusively as an indictment in routine disciplinary measures In this one field of maladjustment commanding officers found frequent use for psychiatrists They ordered a clearance of nervous disability and accordingly an indictment against any soldier whom they wanted to dispose of It then became the psychiatrist's duty to name the soldier a psychopath As one psychiatrist phrased it, 'In a 368 disposition state only the worst you can find out about the man's character, even if you have to exaggerate Get him out" The resulting discharge without honor was of little concern One soldier returning from combat overseas with a good conduct citation and a rating of excellent character at his previous assignments was eliminated in this manner On the other hand a soldier could be admitted to the hospital in an alcoholic stupor with delirium tremens and be discharged to duty in five days as an anxiety state with no mention of alcoholism in his diagnosis This was not a solitary outpost incident This is recorded in one of the largest West Coast general hospitals Psychiatry served no purpose as a fact finding instrument

"Goldbrick" refers to malingerers who feign illness consciously in order to evade duty The wide disparity between the popular use of the epithet and the actual diagnosis of malingering invalidates its application Practically all the soldiers included in this study were "goldbricks" The War Department establishes clear specifications for the indictment of malingerers Psychiatric study reveals that in most instances in which there is conscious intent to avoid duty by pretending illness there is also present a serious personality distortion which obscures, in pathologic significance, the conscious intent to deceive Besides, by War Department regulation a psychiatric opinion to the effect that a soldier is consciously exaggerating his symptoms automatically prescribes that soldier to a court-martial Psychiatrists followed orders, but they shied from the actual initiation of a purely penalizing procedure They labeled the soldier anxiety state instead and the real

malingerers gladly accepted the nomination In this manner again a fundamental psychiatric principle, namely that of developing insight and the capacity for self appraisal, was defeated by Army psychiatric procedure

Psychoses are rarely seen among the enlisted men at a prisoner of war camp The reason can only be speculated They may have been screened out before they reached this level of assignment by many periods of hospitalizations and board appearances It might be said that the only condition which militated against assignment to a prisoner of war camp was insanity of the type that a staff sergeant could recognize

A private aged 33, with three years' service, was referred because he had been acting queerly in the past few days He was found singing at the top of his voice on guard duty Another time he had walked away from detail into a private home, where he was found drinking coffee Off duty he sat in his barracks biting his fingernails, with a blank stare The soldier was an artist, and prior to enlistment he taught portrait painting at a fashion academy He entered the service because he wanted to assist at camouflage. He failed to graduate from the officers' candidate school He had spent five weeks in the locked ward of a station hospital two years previously When he was discharged from the hospital he was assigned to a prisoner of war camp On psychiatric interview he presented a tense stare with the appearance of deep preoccupation He became self conscious when his attention was held He quickly jerked his hand from his mouth when he was questioned about his nail biting He explained that he was afraid that some one would think that he was insane He complained "I can't think things out because I always hear some one saying what I am thinking" This soldier for two years mechanically performed his duties He possessed no independence in feeling or thinking He was not readily accessible, and he did not seek medical aid He never voluntarily reported for sick call the entire three years that he was in the Army He had an advanced dementia precox reaction He had been assigned to the camp as another attempt at rehabilitation

If the psychosis is not sensationally conspicuous it passes unnoticed because the decline in mentality is obscured in the course of numerous transfers and short-term assignments In this case even a record of confinement to a locked ward failed to fix attention on the psychiatric liability of reassignment The psychiatrist had not overlooked the problem

SUMMARY

In the evaluation of the mental disorders at the prisoner of war camp attention was given to the soldier's account of his prior experiences, his reactions to his present situation and his personal disqualifications for duty The digressions in the reactions toward such experiences as are common to all soldiers determine their pathologic character Hysteria conversion states were almost endemic Morale was low The restrictions which were applied to the prisoners radiated over the activities of the men who guarded them By reason of assignment to a prisoner camp the enlisted men came to include themselves in the same low caste which enshrouded the prisoners The assignment was a fertile field for the exaggeration of mental disease, which, ironically enough, seemed to be, under current regulations, the essential qualification for just this assignment

The personnel represented the seepage from all organizations in the Army, largely consisting of soldiers who had been rejected by every other branch of the service They had a career of many periods of hospitalizations and many reassignments caused by repeated applications against requisitions received Thirty per cent of the enlisted strength of the unit were unfit for service of any kind Psychopathic reactions predominated Among the 380 men who were serious psychiatric casualties only 15 had received more than one interview with a psychiatrist Two hundred and twelve had never previously been referred to a psychiatrist since the time they were inducted

This exposition of failure on the part of the psychiatric administrative branch of the Army to organize and employ available psychiatric skills is presented with a view of explaining the universal dissatisfaction with psychiatric results in the zone of the interior during the war The gigantic rehabilitation load facing the country today stands evidence Psychiatry is now applying its resources in civilian life in a manner to compensate for its forced ineffectiveness in the Army

## NITROGEN MUSTARDS IN THE TREATMENT OF NEOPLASTIC DISEASE

Official Statement

CORNELIUS P RHOADS M D
Chairman Committee on Growth of the National Research Council
New York

The chemical and biologic properties of the nitrogen mustards have recently been summarized [1] Through the cooperation of the Chemical Warfare Service, United States Army, the National Defense Research Committee and the Committee on Medical Research of the Office of Scientific Research and Development, the National Research Council and with aid from the Jane Coffin Childs Memorial Fund for Medical Research, studies were undertaken to ascertain the value of the clinical use of the nitrogen mustards in the treatment of neoplastic disease *Tris*(β-chloroethyl)amine hydrochloride and methyl-*bis*(β-chloroethyl)amine hydrochloride are the only compounds of the nitrogen mustard series thus far investigated in this association The studies were begun under a contract between the Office of Scientific Research and Development and Yale University, and authority to carry out the work was subsequently given by the Committee on Atypical Growth of the National Research Council to the University of Chicago Medical School, the University of Utah Medical School and Memorial Hospital, New York Thus far, a total of 160 patients suffering from neoplastic disease (chiefly lymphoma, leukemia and allied conditions) has been treated with these agents Detailed clinical reports of the therapeutic results obtained are now in process of publication [2]

The present status of methyl *bis*(β chloroethyl) amine hydrochloride and *tris*(β chloroethyl) amine hydrochloride (nitrogen mustards) in the treatment of neoplastic disease

Gurman Barron, E S Smith T Lushbaugh C, and Dick G F Studies on the Effect of Methyl *bis*(β-Chloroethyl)Amine Hydrochloride (DEMA) on Malignant Disease of the Hemopoietic System to be published Karnofsky, D A Craver, L F Rhoads C P and Abels, J C An Evaluation of Methyl *bis*(β Chloroethyl)Amine Hydrochloride and *Tris*(β-Chloroethyl)Amine Hydrochloride (Nitrogen Mustards) in the Treatment of Lymphomas Leukemia and Allied Diseases to be published

The present therapeutic status of the nitrogen mustards is herewith summarized and is presented for the information of the medical profession The agents are available for experimental purposes only through the Committee on Growth National Research Council, in cooperation with the Chemical Warfare Service

1 Methyl-*bis*(β-chloroethyl)amine hydrochloride has been used more extensively than *tris*(β-chloroethyl) amine hydrochloride On the basis of this experience the methyl-*bis* compound seems to be preferable, as venous thrombosis is not so likely to follow at the injection site

2 The dosage of the methyl-*bis* compound recommended as a single course is 0 1 mg per kilogram intravenously on four successive days (a total of 0 4 mg per kilogram) This recommendation is based on experience in which larger total doses given as a single course have proved to be hazardous

3 The toxic effects of methyl-*bis*(β-chloroethyl) amine hydrochloride are (*a*) severe local inflammatory reaction if the material escapes into the tissues at the site of the intravenous injection, (*b*) varying degrees of nausea and vomiting occurring one to eight hours after a single dose and continuing for three to twenty-four hours, associated less constantly with anorexia and weight loss, weakness and headaches and (*c*) damage to the blood forming organs The alterations in the peripheral blood which may result from a course of treatment follow in the order of their frequency 1 Leukopenia (lymphopenia followed by neutropenia) may be moderate to severe and may persist for one month or more Symptoms due to agranulocytosis have rarely been observed 2 Normocytic anemia similar to that which may follow conventional x-ray therapy is not infrequent 3 Bleeding tendencies, at times accompanied by thrombocytopenia, may occur They include bleeding from the gums and rectum and small purpuric spots, but such findings are rare after the ordinary course of treatment

4 The following general comments may be made on the therapeutic value of the nitrogen mustards thus far examined for the treatment of the neoplastic diseases mentioned in this report

(*a*) They are not a cure for such neoplastic diseases as have been studied.

(*b*) The nitrogen mustards in large enough doses are injurious to many types of tissue, they appear to exert their greatest effects on rapidly growing tissue, presumably either normal or neoplastic.

(*c*) Their predominant toxicologic effect is damage to normal hemopoietic function The extent of this injury is the limiting factor in determining the amount that can be given to an individual In some cases the hemopoietic injury exceeds the effect on the tumor

(*d*) The tumor regressions induced by these compounds (even with maximum dosages) are temporary, with maximal persistence rarely extending beyond several months

(*e*) The effects of the nitrogen mustards are in many respects similar to those of x-rays It should be noted, however, that the great advantage of radiation therapy is that it can be given locally

5 *Treatment of Hodgkin's Disease*—In patients with early and slowly progressing disease, regression of lymph nodes and symptomatic remissions lasting from four to eight months may follow a course of treatment with methyl-*bis*(β-chloroethyl)amine hydrochloride. Usually, however, improvement, as evidenced by disappearance of fever, feeling of well being and weight gain, continues only from two weeks to a few months and is followed by fairly rapid relapse The relapses may respond to further therapy, but the remissions induced are progressively shorter in duration Decreased fever and general symptomatic improvement have been the most constant and conspicuous effect of this compound

Cases responding favorably show regression of lymph nodes and occasionally decrease in size of the liver and spleen, but in the more advanced or active forms of the disease such regressions are less frequent and if they occur are short lived The more rapidly progressive the disease, the shorter the clinical remission

Large masses of matted lymph nodes, invasion of the disease beyond the lymph nodes, and bone lesions, in general, may not show a favorable response, even though general symptomatic improvement including relief from pain due to bone involvement may occur The anemia of Hodgkin's disease is sometimes improved Skin lesions due to Hodgkin's disease may or may not be affected, and pruritus is only slightly and inconstantly relieved

In the late stages of the disease and when x-ray treatment is without effect, methyl-*bis*(β-chloroethyl) amine hydrochloride seldom produces a prolonged improvement but has in some instances significantly interrupted the progress of the disease

In the early, slowly progressive case with localized disease, x-rays are still the preferred method of treatment If the disease becomes widespread and systemic effects are present, such as fever, anorexia, weakness and anemia, treatment of the localized lesions with x-rays may not produce a satisfactory systemic remission In such cases the methyl-*bis* compound has proved to be of considerable use in causing temporary symptomatic remissions, and the treatment may be repeated as long and as often as the hematologic status permits

6 *Treatment of Lymphosarcoma*—The highly aggressive, rapidly growing type of lymphosarcoma usually has not been significantly affected by maximum doses of the methyl-*bis* compound In such disease x-ray therapy likewise has proved not to be of much value

The type of lymphosarcoma characterized by normal or elevated white blood cell count, consisting chiefly of lymphocytes, and with enlarged lymph nodes diagnosed histologically as lymphosarcoma, may respond satisfactorily to the methyl-*bis* compounds, as evidenced by a prolonged depression of the white blood cell count and regression of enlarged nodes There is little doubt that radiation therapy is also effective in cases of this type

7 *Treatment of Giant Follicle Lymphoma (Brill-Symmer's Disease)*—The methyl-*bis* compound may produce a therapeutic effect in early or relatively benign cases, x-ray therapy is also effective and its use is to be preferred

8 *Treatment of Lymphatic Leukemia*—The methyl-*bis* compound does not appear to be of value in the treatment of acute lymphoblastic leukemia In the slowly progressing and chronic forms it will lower the white blood cell count and decrease the size of the lymph nodes with somewhat less effect on an enlarged liver and spleen, but it may cause a fall in hemoglobin levels Far advanced cases with severe anemia do not respond favorably, and the use of the methyl-*bis* compound in this situation is not recommended

In general, slowly progressing forms of lymphatic leukemia respond favorably to cautiously administered methyl-*bis* compound as well as to x-rays, but the former because of its toxicity is regarded as unnecessarily hazardous for use in early stages

9 *The Treatment of Myeloblastic Leukemia*—The methyl-*bis* compound appears to be of no value in the treatment of acute myeloblastic leukemia In the chronic forms of the disease either x-rays or the methyl-*bis* compound are usually useful When a greatly enlarged spleen is present, local irradiation seems preferable

10 *Miscellaneous Types of Cancer*—The experimental use of the nitrogen mustards in the treatment of any active, extensive, neoplastic process is probably justified if other methods of control have proved to be without benefit Preliminary and limited trials in melanosarcoma, metastatic mammary and cervical carcinoma multiple myeloma and sympathicoblastoma have not been encouraging A limited but favorable experience with the methyl-*bis* compound in inducing temporary symptomatic remissions in anaplastic carcinoma of the lung has encouraged further trials in this type of disease The clinical response of polycythemia rubra vera to the methyl-*bis* compound appears to be comparable to results obtained with radioactive phosphorus

### FUTURE WORK

It is planned to continue laboratory and clinical work with these agents in the hope that certain types of cancer may be found to be unusually sensitive to the action of the nitrogen mustards that a compound allied to the methyl-*bis* compound with a more selective destructive action on cancer tissue may be discovered, and that techniques for improving the therapeutic effectiveness of the nitrogen mustards may be developed The value of combining nitrogen mustard with other types of cancer therapy will also be investigated

Methyl-*bis*(β-chloroethyl)amine hydrochloride will be distributed free to qualified institutions for investigational purposes on application to the Committee on Growth National Research Council, Washington, D C

## PULMONARY CALCIFICATION AND SENSITIVITY TO HISTOPLASMIN, TUBERCULIN AND HAPLOSPORANGIN

AMOS CHRISTIE, M D and J C. PETERSON, M D
Nashville, Tenn

In a recent paper we[1] reviewed the problem of calcification occurring in the chests of persons who are insensitive to tuberculin At that time we outlined the clinical and epidemiologic evidence for suspecting a benign form of histoplasmosis or some other biologically related infection to be the cause of this phenomenon

These studies have been undertaken in order to throw light on certain clinical observations that there exists in many sections of the United States a prevalence of pulmonary calcification far in excess of that which can be explained on the basis of tuberculosis as revealed by tuberculin cutaneous testing In the past twenty years there has been an increasing interest in this subject and there have appeared a number of papers which show a consistent discrepancy between the tuberculin tests and the prevalence of pulmonary calcification In these papers 27 to 83 per cent of young persons were found to have pulmonary calcification, a phenomenon generally accepted as indicative of tuberculosis yet in each study one half or less of the patients were found to have positive tuberculin tests These reports were the outcome of studies conducted with few exceptions on young people living in or adjacent to the western Appalachian plateau or the eastern slope of the Mississippi River basin and the bordering states of the western slope of the Mississippi River basin"

While anergy or loss of sensitivity to tuberculin from complete healing of the tuberculous process may be an acceptable explanation in some cases we do not believe that this can explain the decided prevalence of pulmonary calcification in this area We were challenged to investigate other reasons which might explain this phenomenon

Cox and Smith,[3] Aronson Saylor and Parr[4] and others have shown that coccidioidomycosis is in certain areas of the West responsible for a primary complex which goes on to calcification The suggestion of Smith[5] that histoplasmosis occurs most frequently in the area where pulmonary calcification is high in those whose reaction to tuberculin is negative seemed to offer a good working hypothesis

We accordingly began to perform cutaneous tests with extracts of Histoplasma capsulatum and to look for nonfatal examples of the infection The fungus H capsulatum had been reported to cause acute and subacute granulomatous lesions progressing with great regularity to a fatal termination Our studies have enabled us to observe examples of a benign form of histoplasmosis and to discover that many people react to extracts of the fungus A remarkable correlation

From the Department of Pediatrics Vanderbilt University School of Medicine

1 Christie Amos and Peterson J C Pulmonary Calcification in Negative Reactors to Tuberculin Am J Pub Health 35:1131 1945

2 A nearly complete bibliography of these studies is to be found in footnote 1

5 Smith Charles E. Coccidioidomycosis M Clin North America 27 790 1943

between these observations and the presence of nontuberculous pulmonary calcification has been shown [6]

It is our purpose in this paper to elaborate this thesis further by presenting the results of cutaneous tests and roentgenographic studies in another group of children

## MATERIAL AND METHODS OF STUDY

In this study children from an institution for child care were examined The home, a boarding school, is located in Davidson County Tenn, on the outskirts of Nashville in rolling farm country From routine observations made over a period of several years in our clinic we knew that in the group there were many who had pulmonary calcifications but who did not react to tuberculin The stability of the population enabled us to make a nearly complete study of the whole group, and the fact that the children were from various sections of the state of Tennessee enabled us to make observations on the intrastate geographic distribution of the various phenomena observed This feature of these observations will be reported in a subsequent paper

The age distribution of this group is shown in table 2 The sex distribution is approximately equal The children all attend school on the premises

Roentgenograms of the chests were made with portable equipment on 4 by 5 inch stereoscopic films They were read for the presence or absence of calcification by Dr E F Harrison of the Division of Tuberculosis Control, Tennessee Department of Public Health

All children included in the studies were given intradermal tests with 0 1 mg of old tuberculin, a preparation of histoplasmin [7] and haplosporangin,[8] an antigen derived from Haplosporangium parvum, a fungus isolated by Emmons and Ashburn [9] and shown by them to be related to granulomatous lesions of the lungs of certain rodents

The interpretations of the cutaneous tests were made as follows They were read at seventy-two hours Edema surrounded by a large area of erythema was present in all positive reactions, and an area of induration for more than 5 mm around the site of inoculation was present Reactions were called negative if no induration was present It may be stated that very few equivocal reactions were encountered

The roentgenographic studies and the cutaneous testing were carried out independently to preclude any possible basis for bias

## RESULTS

Three hundred and forty-four children were tested for sensitivity to tuberculin, histoplasmin and haplosporangin, and roentgenograms of their chests were made

Seventy-four (21 5 per cent) reacted to 0 1 mg of tuberculin One hundred and eighty-three (53 2 per cent) had intrathoracic shadows interpreted as calcifications Two hundred and fifty-two (73 2 per cent) reacted to histoplasmin None of the children reacted to haplosporangin These results are shown in table 1, from which it may be seen that in this study, as in our previous report, there is a much greater incidence of pulmonary calcification than of sensitivity to tuberculin More children had calcifications in the absence of sensitivity to tuberculin than had it in conjunction with sensitivity to tuberculin There were more children sensitive to histoplasmin than there were children who had calcifications

It is of interest to point out that tests with a second fungus extract haplosporangin, failed to elicit a single clearly positive reaction Although there were in the group four tests with this antigen which showed slight erythema less than 5 mm in diameter, none showed induration

If the occurrence of calcified pulmonary nodules and the sensitivity to tuberculin and histoplasmin are shown by age groups it may be seen that in the youngest group represented, aged 5 to 9 years, only 1 of the 27 was sensitive to tuberculin, while 13, or almost 50 per cent, had calcifications and 19, or 68 per cent, were sensitive to histoplasmin In the older age groups

TABLE 1—*The Occurrence by Number and Percentage of Sensitivity to Tuberculin, Histoplasmin and Haplosporangin and the Presence of Intrathoracic Calcifications in Tennessee Children*

| Number Examined | Tuberculin Positive | | Histoplasmin Positive | | Haplosporangin Positive | | Intrathoracic Calcifications | |
|---|---|---|---|---|---|---|---|---|
| | No | % | No | % | No | % | No | % |
| 344 | 74 | 21.5 | 252 | 73.2 | 0 | 0 0 | 183 | 53 2 |

TABLE 2—*Number and Percentage of Tennessee Children with Calcifications Their Reactions to Histoplasmin and to Tuberculin by Age Groups*

| Age | Number in Age Group | Tuberculin Positive | | Histoplasmin Positive | | Calcifications | |
|---|---|---|---|---|---|---|---|
| | | No | % | No | % | No | % |
| Total | 344 | 74 | 21 4 | 252 | 73 2 | 183 | 53 4 |
| Under 5 yrs | 0 | 0 | | 0 | | 0 | |
| 5- 9 yrs | 27 | 1 | 3 6 | 19 | 67 0 | 13 | 46.5 |
| 10-14 yrs | 195 | 38 | 19.5 | 120 | 61 8 | 100 | 51.3 |
| 15-19 yrs | 122 | 35 | 27 7 | 107 | 87 5 | 70 | 57.3 |

this general relationship was maintained, but the differential values were not as striking These observations are shown in table 2 The age of appearance of calcification is intermediate between the age observed for the development of sensitivity to tuberculin and that observed for the development of sensitivity to histoplasmin It is obvious from this as was shown in our previous study, that the age at which sensitivity to histoplasmin develops and that at which calcification develops are in such relationship that they might be directly associated The age at which sensitivity to tuberculin appears lags so far behind that for the deposition of calcium that it would not seem to have the same degree of association

Table 3 reveals the number and percentage of children with calcifications according to their reaction to tuberculin and histoplasmin This table shows that 42 (70 per cent) of 60 children who reacted to both histoplasmin and tuberculin had pulmonary calcification One hundred and twenty (62 5 per cent) of 192 children who reacted only to histoplasmin were found to have calcifications in their chests Seven (50 per cent) of the 14 who reacted only to tuberculin had calcifications in their chests These figures suggest that pulmonary calcification occurs less frequently in relation to sen-

sitivity to tuberculin than in relation to sensitivity to histoplasmin That calcifications should occur more commonly when the child is sensitive to both antigens should be expected and is borne out by table 3

Table 4 reveals that 14 (17 9 per cent) of 78 children who did not react to either antigen had calcifications in their chests This is entirely consistent with our previous study A review of the roentgenograms of these 14 children showed that only 2 had massive conglomerate or multiple calcifications The other 12 had calcifications which were borderline and could very well have been called negative They showed small areas of increased density concerning which it was extremely difficult to be certain as to whether they were vessels, calcifications or small areas of other confluent densities A few of these children might have given a positive reaction to 1 mg of old tuberculin Anergy or loss of sensitivity to either or to both antigens is probably not so uncommon but that it could explain these few exceptions One must also consider the possibility that there are other infections in this area which may lead to pulmonary calcification

## COMMENT

This study, in a manner strikingly similar to the one previously reported shows a remarkable relationship between sensitivity to histoplasmin and the development of pulmonary calcification The early development of sensitivity to histoplasmin followed by the development of the calcification at a rate much greater than the age specific rate of sensitivity to tuberculin suggests that most of the lesions are more likely to be related to the development of sensitivity to histoplasmin than to be associated with tuberculosis It is extremely unlikely that these clinical manifestations are limited to the Tennessee area where they were observed, indeed, the studies of Palmer and Furcolow [10] suggest a broad geographic incidence, since they report similar conditions commonly present in various sections of the Mississippi valley and less frequently in most sections of the United States

Present concepts of the primary complex or first infection tuberculosis in its relation to pulmonary calcification need reevaluation The same may be true of tuberculosis due to reinfection The significance of these studies in relation to thousands of veterans in whom pulmonary calcifications have developed while they were in the armed forces needs study Present day concepts based on mass roentgenographic studies need to be redefined The significance of the observations and their importance to the clinician, public health officer, roentgenologist and pathologist we believe to be obvious

10 Furcolow Michael L, and Palmer Carroll E The Geographic Distributions of Sensitivity to *Histoplasmin* read before the Southern Medical Society at Cincinnati in November 1945

The observations herein reported confirm in part those of Emmons and Olson [11] concerning the occurrence of cross sensitivity in animals infected with Haplosporangium parvum and Histoplasma capsulatum His studies showed that sensitivity to haplosporangin was absent in animals infected with Histoplasma capsulatum, Blastomyces dermatitidis and Coccidioides immitis Our studies show that individuals reacting to histoplasmin and possibly infected with this organism do not react to haplosporangin This would also allow us to state that infection with Haplosporangium parvum plays no significant part in the development of nontuberculous pulmonary calcification in Tennessee

TABLE 4.—*Histoplasmin and Tuberculin Reactions in 183 Children with Pulmonary Calcification*

## CONCLUSIONS

1 A study of the roentgenograms of their chests and the cutaneous sensitivity to histoplasmin and to tuberculin of 344 Tennessee children and young adults indicates the existence of a relationship between sensitivity to histoplasmin and pulmonary calcification

2 The absence of cutaneous sensitivity to haplosporangin in 344 subjects, 53 per cent of whom were found to have pulmonary calcifications, would seem to preclude the possibility that infection with Haplosporangium parvum has a significant bearing on the development of pulmonary calcifications in residents of Tennessee

**The Roman Hospital System**—The legend of the origin of the first hospital in Rome has often been told Plague or some other pestilence having broken out in the city in 293 B C., a mission was sent to seek help from Epidaurus A sacred serpent was entrusted with the task of healing, and as the ship sailed up the Tiber the serpent swan ashore and landed on the island of St. Bartholomew The plague was stayed, and on the island, which is shaped like a ship and bears a serpent and staff carved on the "prow" there was established the hospital from which many years later (A D 1123), came Rahere the monk to found St Bartholomew's Hospital in London. To the island hospital of Rome in the days of the republic men sent their sick slaves so as to avoid the trouble of caring for them at home. Thus it became a haven for the sick poor Later, in the first and second centuries A D, there is mentioned by various writers the existence of valetudinaria which appear to have been private hospitals or "nursing homes" They may have developed eventually into public institutions It was only to be expected that in the well organized Roman army there should be hospital accommodation for sick and wounded soldiers These were established at various strategic points, and the sites of several of them have been excavated. One of the most perfect examples is at Novaesium, near Düsseldorf It dates from about A D 100 and, constructed on the corridor system, is strangely modern—Guthrie, Douglas A History of Medicine, Philadelphia, J B Lippincott Company, *1946*

# AMPHETAMINE (BENZEDRINE) SULFATE FOR ACUTE BARBITURATE POISONING

A. W FREIREICH, M D
and
J W LANDSBERG M D
Hempstead N Y

The treatment of coma resulting from barbiturate poisoning still taxes the therapeutic skill of the physician Numerous drugs have been tried in the past with variable success Among the more popular may be mentioned ephedrine, nikethamide, strychnine and brucine. Picrotoxin has received extensive trial in the past few years [1] with many favorable results yet leaves something to be desired in the treatment of the deeply comatose patient In our experience, when the quantity of barbiturate ingested has been large, particularly when the more rapidly acting derivatives are used, the amount of picrotoxin required to counteract it is so great that convulsions appear, necessitating the intravenous injection of barbiturates to control them The present status of therapy with picrotoxin can best be summed up in the report of the Council on Pharmacy and Chemistry [2] "The details of events in the course of animal experiments show that it is necessary to poison the animal with picrotoxin in order to elicit the antagonism What results when the two drugs are given together is not a direct reversal of the depressed state but a combined form of poisoning by picrotoxin and the barbiturate with a mixture of depression and stimulation, from which within a given range of doses the animal ultimately recovers"

Amphetamine (benzedrine) sulfate as a drug useful in counteracting poisoning by the barbiturates was first suggested by Myerson [3] In numerous carefully controlled studies, he and his associates demonstrated the reciprocal pharmacologic effects of amphetamine sulfate and the barbiturates [4] Reifenstein and Davidoff [5] have demonstrated that the depth and duration of narcosis with soluble amytal were affected by the drug, as in every case the narcosis was completely counteracted by the injection of 20 or 30 mg of amphetamine sulfate intravenously, and in 5 instances by only 10 mg

The typical case of poisoning by barbiturates presents a picture of extreme depression of the central nervous system with coma, shallow respiration and low blood pressure falling rapidly to shock levels [6] The effect of the administration of amphetamine is twofold sympathomimetic and wakeful-psychologic [3] The sympathomimetic action is demonstrated by a rise in blood pressure, an increase in the rate and depth of the respiration and an increase in the pulse rate In its wakeful-psychologic effects amphetamine specifically counteracts the soporific action of the barbiturates Pharmacologically it would seem that amphetamine is a suitable antidote in barbiturate intoxication

An attempt to evaluate its effectiveness was made by us on patients admitted routinely to Meadowbrook Hospital (Nassau County, N Y) in coma from an overdosage of barbiturates taken with suicidal intent The patients were treated as admitted, no effort at selection being made To date we have treated 14 patients The diagnosis of barbiturate poisoning was made by physical examination and from history supplied by relatives and confirmed by demonstration of the drug in the urine and in the gastric contents when lavage was performed

## METHOD OF STUDY

As soon as the patient was admitted treatment with intravenous injections of amphetamine sulfate was instituted [7] We used a preparation containing 10 mg of amphetamine sulfate in 1 cc of isotonic solution of sodium chloride A complete examination was made of the pupillary reflexes, deep tendon reflexes, pulse rate, respiratory rate and blood pressure before the injection, and then the contents of one ampule (10 mg) were injected intravenously without dilution (Later we found we could use larger doses with safety and started treatment in some instances with injections of 40 mg of the undiluted drug and continued with 20 mg doses injected every thirty minutes) Observations of the blood pressure and pulse rate were made just before and after each injection An immediate rise in blood pressure with an increase in the rate and fulness of the pulse were obtained in all cases The pupils became dilated as a result of the sympathomimetic action and remained so during the course of the treatment Supportive treatment in the form of fluids given intravenously was used in some cases when dehydration was present Except in case 11, in which the supply of amphetamine sulfate was exhausted, no other drug was employed

## REPORT OF CASES

CASE 1—V B, a white woman aged 23, was admitted about ten hours after having taken thirty capsules (22½ grains, or 1 46 Gm) of pentobarbital sodium On admission the patient was comatose, with face flushed, lips dry and somewhat cyanotic and reflexes diminished to absent The blood pressure was 90/65, the pulse rate 80, the respiratory rate 12 and the temperature 98 F

The patient received four doses of 10 mg of amphetamine sulfate intravenously over a period of five hours After receiving a total of 40 mg she reacted to the spoken voice with a return of reflexes He recovery was uneventful

CASE 2—H V, a white woman aged 43, had taken ten capsules (15 grains, or 1 Gm) of seconal four hours before admission. On admission the patient was comatose, breathing stertorously, with pupils dilated and face flushed. The blood pressure was 130/80, the pulse rate 150, the respiratory rate 15 and the temperature 97 F Reflexes were absent

The patient received 20 mg of amphetamine sulfate intravenously every half hour After receiving a total of 90 mg the patient had reacted to the drug sufficiently to converse with her

7 Amphetamine (benzedrine) sulfate supplied by Smith Kline & French Laboratories, Philadelphia.

husband. All reflexes had become present. The patient reacted after three hours and her recovery was uneventful

CASE 3—V B, a white woman aged 26, was admitted about four hours after having taken ten capsules (15 grains) of pentobarbital sodium The patient was comatose on admission, the pupils were contracted and did not respond to light The reflexes were completely absent, and the extremities were cold The blood pressure was 120/100, the pulse rate 68, the respiratory rate 24 and the temperature 99 F

The patient received four doses of 20 mg of amphetamine sulfate intravenously over a period of one and a half hours After receiving a total dosage of 80 mg the patient was reactive responding rationally to questions Her recovery was uneventful

CASE 4—V B, the person who on her first admission as patient 1 was treated for barbiturate poisoning, about twelve hours before her second admission had taken thirty capsules (22½ grains) of pentobarbital sodium She was comatose, with face flushed pupils dilated reflexes absent and extremities cold The blood pressure was 84/65 pulse rate 80 the respiratory rate 16 and the temperature 97 4 F Her general condition was worse than on the previous admission

The patient received a total of 320 mg of amphetamine sulfate intravenously over a period of seven and a half hours At the end of this time she was responsive Her recovery was uneventful

CASE 5—A M, a white man aged 38 was admitted to the hospital in a deep coma The pupils were constricted and did not respond to light. All the deep reflexes were diminished It was stated that he had taken twenty capsules of amytal (3 grains or 0 2 Gm each?) The temperature was 97 F, the pulse rate 68 and the respiratory rate 15

The patient received a total of 150 mg of amphetamine sulfate intravenously over a period of eight hours and except for a slight headache, his recovery was uneventful

CASE 6—E W a white woman aged 40, was stated to have taken 12 grains (0 78 Gm) of pentobarbital sodium about two hours before admission She was comatose The pupils were constricted and did not react to light. The deep reflexes were diminished The temperature was 98 F, the pulse rate 90, the respiratory rate 20 and the blood pressure 90/70

The patient was given one intravenous injection of 40 mg of amphetamine sulfate, and one-half hour later she was awake and responding to questions

CASE 7—L M a white woman aged 45, was stated to have taken 12 grains (0 78 Gm) of pentobarbital sodium (How long a time before admission the drug had been taken was not known) She also had a history of acute alcoholism On admission she was semicomatose. The deep reflexes were diminished, but the pupils reacted to light The temperature was 100.2 F, the pulse rate 89, the respiratory rate 20 and the blood pressure 128/78

She was given one intravenous injection of 20 mg of amphetamine sulfate, and one-half hour later she had responded sufficiently to speak, although her speech was somewhat slurred Her recovery was uneventful

CASE 8—V G, a white man aged 41, was said to have taken ten tablets of a barbiturate of unknown strength On admission he was comatose. The pupils were slightly dilated but reacted to light The temperature was 100 F the pulse rate 110, the respiratory rate 28 and the blood pressure 96/68

The patient received a total of 40 mg of amphetamine sulfate intravenously over a period of three hours One-half hour after the last injection he responded His recovery was uneventful

CASE 9—M C, a white woman aged 39, was said to have taken seconal sodium 23 grains (1 5 Gm.) phenobarbital 20 grains (1 3 Gm) and bromides 10 grains (0 65 Gm) about eight hours before admission On admission she was comatose. The pupils reacted to light, and the deep reflexes were diminished She did not respond to painful stimuli The temperature was 98 6 F, the pulse rate 20, the respiratory rate 30, and the blood pressure 110/70

She received a total of 400 mg of amphetamine sulfate injected intravenously over a period of eight hours At the end of this period she was conscious and complained only of slight drowsiness Her recovery was uneventful

CASE 10—E T, a white woman aged 41, was said to have taken fifty tablets, ½ grain (0 03 Gm) each, of phenobarbital On admission she was semicomatose The pupils reacted to light All deep reflexes were moderately diminished The patient reacted to painful stimuli The temperature was 99 F, the pulse rate 90, the respiratory rate 10 and the blood pressure 80/?

She received a total of 100 mg of amphetamine sulfate intravenously over a period of about six hours At the end of this time she responded Her recovery was uneventful

CASE 11—J C., a white man aged 45 was admitted in coma and with depressed respiration The deep tendon reflexes were absent. The temperature was 101 F, the pulse rate 95 and the respiratory rate 24

The patient was said to have taken twenty capsules of sodium amytal (3 grains, or 0.2 Gm, each), a total of 60 grains (4 Gm) Treatment was started with the injection of 20 mg of amphetamine sulfate intravenously every half hour After 360 mg had been used the supply of the drug was exhausted, and no more could be obtained. Treatment was continued with the administration of caffeine and sodium benzoate and ephedrine

On the day after admission the patient's temperature rose to 105 4 F, and the pulse rate to 132 Signs of consolidation at the base of the right lung were present. Sulfadiazine and penicillin were administered, but the patient died on the second day after admission

An autopsy revealed an early pneumonia in the lower lobe of the right lung in the stage of red hepatization

Chemical analysis of the liver and urine revealed the presence of barbiturates in large amount.

CASE 12—E C., a white woman aged 30 was admitted with a history of having taken nine or ten capsules of pentobarbital sodium and a quantity of whisky on the night before admission. Therapy was instituted about eighteen hours after the drug had been ingested After 200 mg of amphetamine sulfate had been injected intravenously the patient was opening her eyes and trying to sit up in bed Her recovery was uneventful

CASE 13—L C, a white woman aged 54, was admitted with a history of having taken fourteen capsules of seconal (1½ grains or 0 1 Gm, each) When the ambulance surgeon had seen her at home the respirations had been depressed to 4 per minute and artificial respiration was administered On admission to the hospital the pupils were small and did not react to light There was no corneal reflex The deep tendon reflexes were all absent except for a slight response in the left knee. The blood pressure was 70/60

After receiving 210 mg of amphetamine sulfate intravenously, the patient began to react to painful stimuli The pupils reacted to light, and the deep reflexes had returned Her recovery was uneventful

CASE 14—V G, a white woman aged 36, was admitted with a history of having taken forty to fifty tablets of evipal sodium about one hour previously She had been given 1 cc of picrotoxin (strength?) by her attending physician prior to admission She was deeply comatose The blood pressure was 122/80, the pulse rate 112 and the respiratory rate 28.

Treatment was instituted with 30 mg of amphetamine sulfate injected intravenously and was continued with 20 mg every half hour After receiving 190 mg of the drug she began to react to painful stimuli and tried to speak

On the day after admission the temperature rose to 102 4 F and there were signs of pneumonia at the lower lobe of the right lung With the administration of penicillin and of sulfonamides the pneumonia cleared, the temperature became normal and recovery was uneventful

## COMMENT

The need for active and persistent treatment of barbiturate poisoning cannot be stressed too strongly. A false sense of security is felt on observing the state of coma resulting from an overdosage of barbiturates

Unless cyanosis, Cheyne-Stokes respiration or an elevation of temperature has supervened the impression is obtained that the patient is merely in a deep sleep and will awaken after the effects of the drug have worn off Valuable time may be lost before instituting therapy If active treatment is not undertaken rapidly, death will occur from respiratory depression, usually a terminal bronchopneumonia or pulmonary atelectasis

Picrotoxin has received wide use in barbiturate intoxication It is a powerful stimulant of the central nervous system and for the most part is an effective drug in the depressed state of barbiturate poisoning However, its action on the cerebral cortex is less than that on the midbrain, the medulla and the spinal cord This leads to the result commonly observed in its use in barbiturate poisoning the patient is in a state of convulsions and is still deeply in coma The dangers inherent in the use of this powerful convulsant led us to evaluate the therapeutic properties of amphetamine sulfate

The reciprocal pharmacologic action of amphetamine sulfate and the barbiturates allows for the use of much larger doses of amphetamine than one could administer to a person under normal physiologic conditions One of our patients required as much as 400 mg of amphetamine intravenously No unusual toxic effects were noted The hyperthyroidism of 1 patient did not become adversely affected by the use of the drug

The evaluation of any drug in barbiturate intoxication is very difficult the individual response to different doses is so variable No doubt some of the patients, if undisturbed, might have had a long sleep and awakened none the worse for their experience However, the need for active treatment to prevent pulmonary stasis congestion, pneumonia and atelectasis is always present The shallow respiration of the person in deep sleep makes him a potential candidate for these pulmonary complications, and shortening the period of sleep, even though it may not be essential to preserve life, is desirable

Results of treatment with picrotoxin for patients having taken as little as 10 grains (0 65 Gm ) of a barbiturate have been reported Some of these patients would have recovered, no doubt, without any treatment with the drug

In a series[8] of 24 cases of barbiturate poisoning in which treatment with picrotoxin was given, five fatalities occurred In the present group of 14 cases of treatment with amphetamine sulfate injected intravenously the death of only 1 patient resulted

### SUMMARY AND CONCLUSIONS

Fourteen patients poisoned with barbiturates were treated with amphetamine sulfate injected intravenously Thirteen patients recovered without any observable ill effects except for some headache The patient who died had not received in our estimation, a sufficient quantity of amphetamine sulfate because no more of the drug was available

Experience with this small series of cases of poisoning with barbiturates is favorable enough to warrant further use of amphetamine sulfate for this type of therapy

## MENINGITIS DUE TO ESCHERICHIA COLI TREATED WITH STREPTOMYCIN

LIEUTENANT COLONEL ALEXANDER J ALEXANDER
M C A U S (Inactive Status)
Lexington Ky

Meningitis due to Escherichia coli is fortunately not common. It is most frequently found in newborn infants Occasionally it is secondary to bacteremia or to wounds penetrating the meninges, especially when there is fecal contamination Strong and Edwards[1] reported a case of meningitis due to E coli following a wound in which a bullet had lodged in the sacrum penetrating the spinal canal Recovery followed the removal of the foreign body with drainage of a previously undiscovered subdural abscess and therapy with large doses of sulfadiazine Such fortunate results are not common and in most cases the sulfonamides have little or no effect on organisms of the colon typhoid group Until recently the prognosis in meningitis due to E coli has been extremely poor and the mortality rate exceedingly high owing largely to the lack of an effective chemotherapeutic or antibiotic agent The recent development of new antibiotics particularly streptomycin has raised the first ray of hope in the treatment of this condition Streptomycin is known to have a definite effect on E coli and on other gram-negative organisms in vitro[2] There is evidence in unpublished reports from several sources that streptomycin is effective in vivo against many of these organisms No references either in the medical literature or in unpublished reports, were found on the use of streptomycin in the treatment of meningitis due to E coli As streptomycin is a new therapeutic agent for which dosages have not been fully established, and since the types of infection which respond to it have not yet been completely determined this case is thought to be sufficiently interesting and instructive to be reported

### REPORT OF CASE

*History*.—C L a private aged 19 was wounded in action in France Jan 12 1945 sustaining extensive injuries including compound comminuted fractures of both tibias partial amputation of the left foot and fracture of the laminas of the twelfth dorsal vertebra He received supportive measures and emergency surgical treatment including debridement. A note at the time of debridement stated that the spinal cord and covering were intact A few days after injury a urinary fistula developed This closed spontaneously shortly thereafter Subsequent urologic examinations disclosed no abnormality Saucerization of

the upper end of the right tibia was performed on April 20 because of osteomyelitis. A sinus over the involved portion of the right tibia continued to drain intermittently. The course was otherwise uneventful.

On October 7, in preparation for reamputation of the left foot, the patient was started on penicillin 15 000 units intramuscularly every three hours. On October 8, under spinal anesthesia (procaine 150 mg.) reamputation of the left foot was performed and a small piece of shrapnel removed from under the skin of the right side of the back. The following day the temperature rose to 102 F. and the patient complained of severe headache. For the next five days the temperature was septic in type. Persistent vomiting developed. The patient noticed that his neck was sore but there was no stiffness. Headache became more severe. Nothing was found in the abdomen or wounds to account for the fever. Examinations by the medical and neurologic consultants failed to reveal any significant findings until October 14, when there was slight stiffness of the neck and slight blurring of the optic disk margins. Lumbar puncture revealed opalescent fluid, pressure 160 mm. of water, dynamics normal. Penicillin 10,000 units was injected intrathecally, pending spinal fluid studies.

*Physical Examination.*—The patient was tall and thin, weighing about 120 pounds (54 Kg.). He was obviously critically ill. He was emotionally upset, complained of a severe headache and did not wish to be disturbed. There was a draining sinus over the lateral aspect of the upper end of the right tibia. Examination of the other wounds and scars showed no evidence of infection. There was no redness, swelling or tenderness over the twelfth dorsal vertebra or the scar just to the left of it. There was definite nuchal rigidity. Kernig's sign could not be tested because of splints and bandages on the legs. The deep tendon reflexes were slightly hyperactive and equal. There were no pathologic reflexes. The optic disks showed slight haziness of the margins without choking. The remainder of the physical examination was negative.

Clinical course

*Laboratory Examination.*—The white blood cell count ranged between 5,300 and 11 800.

Urinalyses on October 10 and 11 showed many pus cells with clumps but examinations thereafter were negative.

Smears of pus from the sinus over the right tibia showed gram positive cocci and gram negative bacilli. Cultures were overgrown by Proteus vulgaris.

Blood culture on October 14 was sterile but on October 15 yielded a growth of E. coli. Blood cultures thereafter were sterile.

The spinal fluid cell counts and chemical findings are recorded in the accompanying table. Smear of the spinal fluid on October 14 showed large gram negative rods, with an apparent capsule, morphologically resembling Klebsiella pneumoniae. Daily smears of spinal fluid thereafter, through October 26 and on October 28 and 31 and November 5, showed no organisms. On spinal fluid cultures done October 14 and 17 E. coli was recovered. All other cultures showed no growth.

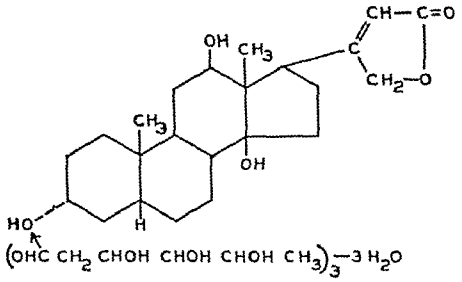
The organisms on culture were smaller than those seen on the direct smear. They were coliform in size and shape, were motile and gave the typical sugar reactions and indole production of E. coli. It was felt that the morphologic characteristics of the organism, as seen on the original smear, had been altered by penicillin therapy. Growth of the organism obtained from spinal fluid on October 14 was suppressed by 4 S. units of streptomycin per cubic centimeter. There was no change in streptomycin sensitivity of the organism obtained on spinal fluid culture October 17. Unfortunately, laboratory facilities were not available for determination of the streptomycin concentration in spinal fluid, blood or urine.

*Treatment and Course.*—The patient was given 50,000 S. units of streptomycin intrathecally and was started on streptomycin 200 000 S. units intramuscularly every three hours. Penicillin, which had been given since October 7, was discontinued. An initial temperature rise to 103.8 F. was followed within sixteen hours by a fall to normal level, which was maintained thereafter except for a slight secondary rise to be described. The patient's clinical improvement was no less dramatic than the rapid disappearance of his septic temperature. Vomiting ceased, headache disappeared and his emotional outlook was greatly improved. The nuchal rigidity definitely diminished. On the third day the laboratory reported that the organism in the spinal fluid was E. coli, not K. pneumoniae, as had been suspected. In view of the good response to streptomycin and the known effect of this drug on infections due to E. coli it was felt that no change in therapy should be instituted. Although E. coli was recovered from blood culture on the second day and from the spinal fluid again on the fourth day, the patient's clinical condition steadily improved. Stiffness of the neck gradually disappeared after about five days. The intramuscular dose of streptomycin was reduced to 125,000 S. units on the fifth day. Daily intrathecal injections were continued through the twelfth day. On the fifteenth day the temperature rose to 100.4 F. and it was feared there might be a recurrence of the meningeal infection. However, lumbar puncture revealed clear fluid with essentially the same findings as two days previously. At this time the sinus over the right tibia had ceased draining and there were increased redness and swelling around the sinus tract. Within a few hours this opened again draining profusely, and the temperature returned to normal. Intramuscular streptomycin was discontinued after the seventeenth day. That evening the temperature rose to 99.2 and the next day to 102 F. The skin around the sinus tract over the right tibia was again red and tender. It was believed that the temperature elevation was due entirely to the osteomyelitis. The patient was therefore started on sulfadiazine. Saucerization of the upper end of the right tibia was subsequently performed on November 24. There has been no recurrence of symptoms suggesting meningitis.

## COMMENT

Streptomycin was successfully used in the treatment of a patient critically ill with meningitis due to Escherichia coli. The source of infection was probably a bacteremia secondary to a mixed type of osteomyelitis of the right tibia since E. coli was found on blood culture. Urinary tract infection, present during the onset of fever was not felt to be the source, since pyuria had completely cleared before the onset of bacteremia and meningeal symptoms. The intramuscular dosage of streptomycin was 1,600 000 S. units daily for four days, then 1,000,000 S. units daily for an additional twelve days. The intrathecal dose was 50,000 S. units daily for twelve days, with one addi

tional dose on the fifteenth day of treatment The total dosage of streptomycin was 18,275,000 S units intramuscularly and 650,000 S units intrathecally The dosage used was empirical, and in retrospect, larger intrathecal doses were probably indicated Although there was a rapid fall in the patient's temperature curve and a dramatic improvement in his general condition, laboratory tests showed that the blood stream and spinal fluid infection did not respond as rapidly as the patient's clinical condition seemed to indicate The persistent finding of approximately 200 cells in the spinal fluid during the period of intrathecal therapy, and the abrupt diminution of pleocytosis after intraspinal administration was discontinued, suggest that the persistently increased cell count was due at least in part to intrathecal therapy No other ill effects or complications due to therapy were noted There was no apparent improvement in the osteomyelitis, although as a mixed infection this was difficult to appraise The rapid clinical improvement, and the ultimate recovery from a previously devastating type of infection, make this case worthy of note The recognized effect of streptomycin on E coli and the excellent results obtained in this case make the further use of streptomycin in E coli meningitis warranted



# Council on Pharmacy and Chemistry

## NEW AND NONOFFICIAL REMEDIES

*The following additional articles have been accepted as conforming to the rules of the Council on Pharmacy and Chemistry of the American Medical Association for admission to New and Nonofficial Remedies A copy of the rules on which the Council bases its action will be sent on application*

AUSTIN SMITH M D, *Secretary*

**DIGOXIN** — $C_{41}H_{64}O_{14}$ (M W 780 92) — A crystalline glycoside which may be prepared from the leaves of Digitalis lanata or Digitalis orientalis The crude digilanids from the leaves are separated by physical methods into digilanids A, B and C Digoxin is formed from digilanid C by hydrolytic removal of acetyl and glucose groups It is standardized by chemical and physical methods and prescribed in terms of weight The structural formula of digoxin may be represented as follows

$(OHC\,CH_2\,CHOH\,CHOH\,CHOH\,CH_3)_3 - 3\,H_2O$

*Actions and Uses*—The actions and uses are closely similar to those of digitalis U S P As a purified substance it is claimed to have particular usefulness when rapid digitalization is necessary, usually within a few hours when administered by mouth and within a few minutes when given intravenously

*Dosage*—Before administering the usual dose of digoxin it must be ascertained that no drug of the digitalis group has been given within two weeks

For rapid digitalization by the oral route an initial dose of approximately 0 75 to 1 5 mg may be administered followed by doses of 0.25 to 0 75 mg at six hour intervals until the ventricular rate lies between 60 and 70, or the maximum therapeutic effect is obtained or toxic symptoms appear Patients who have received digitalis therapy during the preceding two weeks are given 1 mg or less as an initial dose

Very rapid digitalization may be accomplished with an intravenous injection of 0 75 to 1 0 mg Ventricular slowing usually begins within a few minutes and is maximal in one to two hours If complete digitalization is not obtained after six hours, additional doses of 0.25 to 0 5 mg of digoxin may be given intravenously at six hour intervals

For maintenance 0 25 to 0 75 mg may be given daily by mouth, or 0.25 to 0 5 mg may be given intravenously

Digoxin injection is a tissue irritant and the contents of the ampul should be diluted with 10 cc of sterile isotonic solution The product should be injected slowly (five to ten minutes) and care taken to avoid extravenous injection

*Tests and Standards*—

*Digoxin occurs as a white odorless crystalline powder possessing a bitter taste (care!)* When recrystallized from aqueous ethanol it appears in the form of characteristic clusters of thin crystals Digoxin is soluble in alcohol and pyridine but is practically insoluble in chloroform ether and water It melts with decomposition at from 255 to 265 C when placed in a bath previously heated to 250 C

Dissolve 1 mg of digoxin in 2 cc of glacial acetic acid containing 0 01 per cent of ferric chloride and add 1 cc of sulfuric acid to form a subjacent layer a pure brown ring free from red color is formed at the junction of the liquids In a short time the acetic acid layer acquires an indigo-blue color (Keller Kiliani test for presence of digitoxose)

Reflux 0 1 Gm of dry digoxin with 10 cc of alcohol 10 cc of water 0 08 cc of hydrochloric acid (specific gravity 1 16) for one half hour Neutralize the solution to litmus paper with 1 normal sodium hydroxide and evaporate to 2 cc in vacuum filter dry the digoxigenin obtained at 80 C and weigh (yield 45-46 per cent) When recrystallized from alcohol water, the melting point of the product is 210 213 C Dilute the filtrate from the hydrolysis to 25 cc add 0 04 cc of hydrochloric acid (specific gravity 1 16) and heat on a steam bath for twenty minutes Neutralize the solution to litmus paper with sodium hydroxide solution and evaporate to a thick syrup in vacuum

Dry the syrup in vacuum over sulfuric acid and extract the residue three times with anhydrous acetone Evaporate the acetone and dry the residue in vacuum at 80 C If crystals are not formed allow the syrupy residue to stand in an ice chamber until crystals separate the isolated crystals of digitoxose melt at 109 112 C

Dry 0 1 Gm of digoxin in vacuum over phosphorus pentoxide for four hours the loss in weight is not more than 0 5 per cent

The crystallographic and optical properties of digoxin may be summarized as follows The crystals belong to the triclinic system their crystalline habit is platy to tabular with rhombic outline characteristically appearing with one acute angle or corner truncated The crystals are biaxial positive with moderate optic angle The refractive indexes are $\alpha = 1\,522$ $\beta = 1\,550$ and $\gamma = 1\,610$ Birefringence is positive $(\gamma-\alpha) = 0\,088$ Dispersion $r > v$ weak

BURROUGHS WELLCOME & CO, INC, NEW YORK

**Tabloid Digoxin** 0.25 mg

**Solution of Digoxin, 0 05 per cent W/V** 30 cc bottle Each cubic centimeter contains 0 5 mg of digoxin in 70 per cent alcohol solution

**Hypoloid Digoxin Injection, 0 05 per cent W/V** 1 cc Contains 0 5 mg of digoxin per cubic centimeter in 70 per cent alcohol solution

**THEOPHYLLINE ETHYLENEDIAMINE** (See New and Nonofficial Remedies, 1945, p 388)

The following dosage forms have been accepted

BARRY BIOLOGICAL LABORATORY DIVISION OF BARRY ALLERGY LABORATORIES, INC DETROIT

**Solution Aminophylline** 0 50 Gm in 2 cc and 20 cc ampuls and 0.25 Gm in 10 cc ampuls

G D SEARLE & COMPANY, CHICAGO

**Aminophylline Supposicones** 0 50 Gm Each suppository contains aminophylline 0 50 Gm incorporated into a suppository base consisting of a polyethyleneglycol of high molecular weight (Carbowax 4 000 W) and propyleneglycol stearate (Emcol PS 50)

WYETH INCORPORATED, PHILADELPHIA

**Suppositories Aminophylline** 0 5 Gm

**PRIVINE HYDROCHLORIDE** (See THE JOURNAL, June 8 1946 p 522)

The following additional dosage form has been accepted

CIBA PHARMACEUTICAL PRODUCTS, INC, SUMMIT, N J

**Privine Hydrochloride Nasal Jelly, 0 05%** 20 Gm tubes Each 1 Gm contains naphazoline hydrochloride 0 5 mg in a buffered water soluble base containing glycerin tragacanth and aromatics with merthiolate 0 01 mg as a preservative

**PENICILLIN** (See New and Nonofficial Remedies 1945, p 214)

The following dosage forms have been accepted

ABBOTT LABORATORIES, NORTH CHICAGO, ILL

**Penicillin Calcium** 100 000 and 200 000 Oxford unit vials

BRISTOL LABORATORIES, INC NEW YORK

**Penicillin Calcium** 20 cc. vials 100 000 and 200 000 Oxford units

**ASCORBIC ACID** (See New and Nonofficial Remedies, 1945 p 622)

The following dosage form has been accepted

ENDO PRODUCTS, INC, RICHMOND HILL, N Y

**Tablets Ascorbic Acid** 10 mg, 25 mg, 50 mg and 100 mg

# COUNCIL ON FOODS AND NUTRITION

## VITAMIN DEFICIENCIES STIGMAS, SYMPTOMS AND THERAPY

*The accompanying syllabus is a consensus of current views Lack of complete information due to continued rapid development of the subject renders certain statements tentative and subject to probable early revision In presenting this syllabus the Council directs that emphasis be placed on the view that vitamins must never be relied on as a substitute for the regular consumption of an adequate diet*

JAMES R WILSON, M D *Secretary*

The stigmas and symptoms associated with deficiency of vitamin A, thiamine, riboflavin, niacin, ascorbic acid vitamin D and vitamin K are listed in this syllabus together with a statement concerning treatment of each deficiency Deficiencies of several vitamins, notably biotin pyridoxine, pantothenic acid and vitamin E are not accompanied by stigmas which can be recognized at present.[1] The subject is in a stage of fluidity and development which probably will necessitate early revision or amplification Particularly is this true of the diagnosis and treatment of deficiency of folic acid This vitamin has been prepared in isolated form so recently that its consideration here is omitted Not many of the stigmas listed are diagnostic of a vitamin deficiency in themselves but the occurrence of several of these stigmas in association is at least presumptive evidence of some nutritional failure Vitamin deficiencies commonly encountered in clinical practice are multiple Scrutiny of the dietary history is indicated in cases in which several of the stigmas listed are present Due attention should be paid to the well known fact that stresses such as pregnancy, exposure or disease may occasion the development of deficiency states when the diet otherwise might be considered adequate

Treatment for a deficiency involves administration orally or, if need be, parenterally of large enough doses of the vitamin to be of therapeutic value and continuation of this treatment *for long enough periods to assure a satisfactory therapeutic trial* However since the diagnosis is necessarily presumptive in many instances, exclusive dependence on specific therapy is justified only infrequently and basic to good treatment in all cases is a diet planned to be adequate nutritionally and assurance that the diet is eaten.[2] The diet is important for the education of the patient and as a means of dispensing factors heretofore not isolated which will be contained in the foods of such a diet Likewise helpful in treatment because of its content of factors not as yet identified is some good source of the vitamin B complex as a whole Products such as brewers' yeast or an extract of such yeast, wheat germ extracts of cereal grasses or of rice bran crude extract of liver or desiccated liver represent such sources. For a patient who cannot take foods or drugs orally or in whom absorption is poor, crude liver extract may be given intramuscularly or even on occasion it may be diluted with sterile isotonic solution of sodium chloride or dextrose and administered by vein

### Stigmas suggesting deficiency of vitamin A

*Xerosis of the conjunctiva*

Thickening with loss of transparency, so that only the more superficial vessels of the bulbar conjunctiva are clearly seen, associated with more or less yellow pigmentation, especially along the horizontal meridian of the eyeball, infrequently associated with small foamlike plaques called Bitot s spots

*Papular eruptions of pilosebaceous follicles*

A grater-like feel, which in early stages resembles gooseflesh but, when more fully developed, presents the picture of keratosis pilaris The extensor surfaces of the arms and thighs and the flexor surfaces of the legs are primarily affected.

*Xerosis or astcatosis of the skin*

Dryness, scaliness and crinkling, in extreme cases resembling alligator skin In early stages the condition is associated with keratosis pilaris but it persists and extends after follicles have disappeared, the body hairs being broken and later lost. All parts of the body are involved but the skin of the extremities, particularly of the legs is more severely affected than the skin of the head and the trunk

*Follicular conjunctivitis*

Hypertrophy of the follicles particularly of the lower eyelids

*Night blindness*

Conspicuous only in cases of advanced severe deficiency

*Keratomalacia*

Thickening with subsequent ulceration and necrosis of the cornea present only in most severe and advanced forms of deficiency

### *Treatment of vitamin A deficiency*

*Early deficiency state*

25 000 U S P units of vitamin A twice daily for two months or longer

*More chronic states*

25,000 U S P units of vitamin A two to three times daily for a prolonged period

### Stigmas suggesting deficiency of thiamine

*Loss of strength* of the quadriceps disproportionate to loss of general strength, evidenced by difficulty in rising from the squatting position

*Loss of vibration sense* first of the toes and later of the malleoli and tibias

*Tenderness of the calves and hyperesthesia of the feet*

*Diminution and loss of the achilles tendon and patellar reflexes first* Other tendon reflexes are lost in the later stages of the polyneuritis of "dry beriberi"

*Edema* of the shins ankles and knee joints found in "wet beriberi

*Enlarged heart with dependent edema* and elevated venous pressure Poor response to rest and administration of digitalis unless thiamine is given This is a late manifestation of severe deficiency (beriberi heart)

*Papillary edema with retinal hemorrhages* associated with ophthalmoplegia and polyneuritis The condition is a late manifestation of severe deficiency

### *Treatment of thiamine deficiency*

*Acute deficiency state*

10 to 20 mg or more of thiamine twice daily until relief of symptoms, this may be days or weeks

*Chronic deficiency state*

5 to 10 mg or more of thiamine twice daily for a prolonged period

### Stigmas suggesting deficiency of riboflavin

*Congestion of the limbic plexus*

Visible with a small hand lens or the +20 lens of the ophthalmoscope, invasion of the cornea by capillaries arising from this plexus (vascularization) requires a biomicroscope and slit lamp for detection

*Cheilosis*

Represented in chronic deficiency by excessive and irregular wrinkling in acute deficiency by swelling and erasure of the normal wrinkling of the lips Reddening thinning, scaling, chapping of epithelium are associated

### *Treatment of riboflavin deficiency*

*Acute deficiency state*

5 mg of riboflavin three times daily for weeks

*Chronic deficiency state*

3 to 5 mg of riboflavin three times daily for a prolonged period

1 Handbook of Nutrition A Symposium Prepared Under the Auspices of the Council on Foods and Nutrition of the American Medical Association 1943

2 Jolliffe Norman The Preventive and Therapeutic Use of Vitamins J A M A 129 613 (Oct 27) 1945

*Angular stomatitis*
Various combinations of erythema and open fissuring in the angles of the mouth with or without a white, moist maceration (perlèche), scars of healed fissures

*Dyssebacia*
An erythema overlaid with somewhat greasy, flaky accumulations resembling hoar frost, noted mostly in the alae nasi, canthi, pinnae and other folds of the skin, accompanied in some cases by coarsening and elevation of the sebaceous follicles of the nose and cheeks, the latter also seen with deficiency of vitamin A

*Magenta tongue*
A purplish red coloring with moderate edema and flattening of filiform papillae, observed in more advanced deficiency

### Stigmas suggesting deficiency of niacin

*Edema of the tongue*
Shown by dental indentations

*Increased redness of the tongue*
Beefy red in chronic states scarlet red in severe acute deficiency

*Congestion and hypertrophy of the papillae of the tongue, followed by fusion and atrophy*
In early stages the fungiform papillae are congested and hypertrophied This is followed by hypertrophy of the filiform papillae and later by their flattening As they atrophy they fuse or mat together with multiple fissuring to give a cobblestone appearance and finally baldness Vincent's infection of tongue and fauces, ulceration and pseudomembrane formation may or may not accompany these changes in the more advanced stages of this deficiency

*Dermatitis*
Erythema, rough scaling, with ulceration and formation of bullae, affecting primarily areas of the skin exposed to light namely, wrists, ankles, neck and face, observed only in severe deficiency (pellagra) and then frequently associated with diarrhea and dementia

*Encephalopathy*
Clouding of consciousness, cogwheel rigidity and grasping, sucking reflexes observed in acute, severe deficiency

### Stigmas suggesting deficiency of ascorbic acid

*Redness, edema, tenderness and bleeding on pressure of the gums*
Observed in acute or subacute deficiency of moderate severity, sometimes with, but usually without, other signs of ascorbic acid deficiency

*Thickening and increased firmness of the gums*
With recession and exposure of the base of the teeth, including recession of interdental papillae, observed in chronic deficiency

*Retraction of the gums*
Leaving pockets between gum and tooth, secondary infection and resulting pyorrhea, observed in chronic deficiency

*Loosening and shedding of the teeth*

*Increased capillary fragility*
Manifested by petechial hemorrhages of the skin, especially in the tourniquet test, observed in more severe acute and subacute deficiency Easy bruising, spontaneous ecchymosis of the skin, idiopathic hemorrhage into joints and slow healing of wounds observed in severe acute and subacute deficiency

### Stigmas suggesting deficiency of vitamin D

*Deformities of the skeleton*
Bowed legs malformation of the chest (funnel breast) and defects of the teeth may be residues of early rickets which is usually no longer active or susceptible to treatment enlargement of the wrists elbows, knees ankles and chosto chondral junctions (beading, rachitic rosary) and bulging forehead (cranial bosses) which respond to treatment are found in infancy and in the rare example of late rickets

### Stigmas suggesting deficiency of vitamin K

*A tendency to bleeding*
Particularly from minor wounds, related to abnormal lengthening of the prothrombin time developing spontaneously in newborn infants, observed in adults after treatment with dicumarol or large doses of salicylates, in advanced disease of the liver with poor excretion of bile, and in disease of the intestine, such as sprue in which vitamin absorption is disturbed.

### *Treatment of niacin deficiency*

*Acute deficiency state*
100 mg or more of niacinamide twice daily for weeks

*Chronic state*
100 mg of niacinamide twice daily over a prolonged period

### *Treatment of ascorbic acid deficiency*

*Acute or subacute deficiency state*
100 mg or more of ascorbic acid for weeks

*Chronic deficiency state*
100 mg of ascorbic acid three times daily over a prolonged period

### *Treatment of vitamin D deficiency*

*In infants*
1 500 to 2,500 U S P units of vitamin D daily, continued for several months (double this amount for premature infants)

### *Treatment of vitamin K deficiency*

*In adults*
1 mg of vitamin K two to three times daily with or without bile (1 Gm of desiccated bile or bile salts)

*In newborn babies*
1 mg of synthetic vitamin K intramuscularly daily in oil solution for several days

### Deficiency symptoms

A diagnosis of vitamin deficiency only rarely can be based on symptoms or less significant abnormalities than those which have been listed thus far However, such symptoms and abnormalities frequently accompany the more specific lesions of deficiency

Symptoms commonly observed with deficiency of thiamine, also less conspicuously in deficiency of other vitamins, include apathy, lethargy, increased emotional irritability, hypersensitivity to noise and painful stimuli, headache, vague fears, confusion of thought, uncertainty of memory asthenia, loss of manual dexterity, insomnia heart consciousness, paresthesia, anorexia, nausea, flatulence, epigastric pain, constipation.

Photophobia burning of the eyes, lacrimation and eyestrain not relieved by glasses are encountered in deficiency of riboflavin

Other abnormalities unrelated to deficiency of any single vitamin but commonly observed in persons who are malnourished are dry, brittle lack luster rebellious so-called staring head hair, a loss of sleekness analogous to the rough coat of malnourished animals, blepharitis spider-like telangiectasis of the face, seborrhea of the face patchy pigmentation of the face, especially suborbital and circumoral sinus arrhythmia bradycardia, tachycardia low blood pressure, loss of tone of muscles and anemia

## STUDIES IN REVIVAL OF ORGANISMS

From his observations in animal experiments on revival after exsanguination, Negovski[1] emphasizes that death does not always occur abruptly The final changes responsible for true biologic death are usually preceded by a period of so called clinical death, which begins when heart action and respiration cease Clinical death in many instances represents a reversible transition from life to death Intra-arterial administration of blood under pressure is not a complete method of resuscitation in fact the results have been somewhat disappointing Artificial respiration, of equal importance, must be started immediately after revival and must be sufficiently intensive This prompt application, necessary for starting the first spontaneous gasp and indirectly for early return of eye reflexes, may decide the outcome of the entire effort The appearance of the spontaneous gasp in the second minute of revival leads to recovery of nearly 100 per cent of animals, while a delay of nine minutes means death of all reviving animals, if revival is to be followed by a complete and lasting recovery, the period of clinical death must not last longer than five or six minutes Temporary revival can occur after longer periods of clinical death, but the animals do not live long, since the nervous system in such animals is not completely restored During the revival the heart begins to function first, later the tone of the vessels is reestablished, and finally spontaneous breathing is resumed The reflex excitability of the respiratory center is reestablished earlier than that of the vasomotor center Spontaneous respiration precedes restoration of the respiratory center reflex Thus during death the older mechanism of respiratory function survives longer, and during revival this primitive system of humoral regulation is restored more promptly than the highly evolved system of reflex regulation The return of the separate groups of muscles into the respiratory effort also takes place in reverse order The contractions of neck muscles return first, the movements of the thoracic cage follow, and finally the diaphragm begins active contraction Negovski's experimental and clinical observations demonstrate that the more sensitive portions of the central nervous system, without which life is impossible, cannot survive complete anemia for a period exceeding five to six minutes The sequence in which different functions of the central nervous system return is determined by the phylogenetic development of corresponding parts of the brain Areas of the brain which are older phylogenetically were restored sooner Microscopic study of the brain of dogs revived after protracted periods of six to twenty minutes of clinical death revealed striking irreversible changes

As a rule, the earlier any given function makes its appearance in the process of ontogenesis or phylogenesis the sooner is it restored during revival The heart revives before spontaneous respiration is restored In the beginning the revived heart is not amenable to regulation by its nerves In general, during the first steps of revival the effects of automatism are seen, representing the intrinsic activity of organs not yet subordinated to control by the nervous system In the early stages of revival anaerobic respiration is the first to appear as oldest phylogenetically During revival external respiration for example diaphragmatic respiration, which first appears phylogenetically in reptiles, is restored later than costal Also the oldest mode of respiratory regulation, the humoral appears earlier than the reflex control Only at some later time does there appear the reflex control which represents the later type of control in the evolutionary development The central nervous system responds to revival later than all other structures, and its individual functions return in the order of phylogenesis The older functions in general are more stable, for in the process of dying there is an earlier extinction of those functions which phylogenetically are more recent In this sense the return to life recapitulates in reverse order the ebbing of life those processes which resist death the longest or die the latest are those which revive the earliest

Investigations carried out in a maternity clinic on the effect of anemia on the central nervous system of the newborn reveal that the resistance of the newborn to blood loss, especially of their central nervous system, is quite considerable Contrary to the accepted view, the author's experiences suggest that breathing may be restored in the newborn even when heart action has stopped with prompt institution of revival measures The spontaneous respiration of the newborn can be restored with the aid of the pulmotor after exsanguination lasting for thirty minutes, and, if feeble heart action should be present, restoration of spontaneous breathing is possible as late as two hours after birth

1 Negovski V A Agonal States and Clinical Death Problems in Revival of Organisms Am. Rev Soviet Med. 3:339 (April) 1946

## TEMPORAL ARTERITIS A NEW DISEASE ENTITY

Horton, Magath and Brown[1] reported in 1931 observations on 2 patients with fever weakness anorexia, loss of weight, anemia mild leukocytosis and painful tender areas over the scalp and along the temporal vessels These symptoms had been present from four to six weeks Localized periarteritis and arteritis were present in each case Relapses and complete remissions had occurred in both Study of the microscopic sections of the blood vessels removed for biopsy disclosed identical lesions Both patients apparently recovered completely from the local condition although one died two years later from congestive heart failure The bacteriologic studies were largely negative The authors believe that the condition described represents a new clinical syndrome the etiology of which is obscure Dick and Freeman[2] in 1940 reported 2 similar cases and pointed out the characteristic occurrence of giant cells in the inflammatory process of the involved artery Gilmour[3] described postmortem studies in 4 cases of what he termed giant cell chronic arteritis of unknown etiology The histologic picture, although involving many branches of the aorta and the internal and external carotid arteries, frequently presented a focal distribution The presence of multinuclear giant cells was the same as described for cases of temporal arteritis Sproul's[4] postmortem study of a typical case of temporal arteritis revealed profound alterations in the arterial tree The multinucleated giant cell proliferation was a prominent microscopic feature Murphy's[5] patient, a woman aged 71, made a rapid recovery after the removal of a segment of the temporal artery about 5 cm in length Necropsy in a case of characteristic temporal arteritis reported by Chasnoff and Vorzimer[6] revealed a diffuse involvement of the arterial system These authors emphasize that arteritis of the temporal vessels is probably a local manifestation of a systemic arterial disease which cannot be regarded as nonfatal

In a recent article in the *Quarterly Journal of Medicine* Cooke and his associates[7] review the literature on the subject and add 7 cases to the total of 31 reported in the literature Analysis of the cases so far reported shows that headache was a prominent feature of the syndrome and was present at some time in all cases In 6 of the authors' cases the temporal artery showed thrombosis Many cerebral symptoms have been noted, probably caused by the involvement of the cerebral vessels At least half of all the patients had visual disturbances leading in many instances to complete loss of sight The varying types of eye symptoms and signs suggest that the disease must affect the arterial supply of the optic and ocular motor nerves and the retina in varying degree Inflammation of the temporal artery is striking because of thickening and reddening along its course Postmortem examinations carried out in 2 of their cases revealed the characteristic histologic picture in the aorta and the temporal radial, subclavian femoral coronary retinal, celiac and mesenteric arteries Differentiation of the syndrome from other diseases involving the blood vascular system, such as periarteritis nodosa and thromboangiitis obliterans is not always easy because of many similarities

Both biopsy and postmortem observations in temporal arteritis have been unsatisfactory so far in that these studies were made at different stages of the disease, so that a clear conception of the pathologic process has been impossible to obtain The treatment is to a great extent systemic In some cases varying amounts of relief were obtained either from a resection of a segment of the temporal artery involved or of a biopsy The therapeutic effect of nicotinic acid, of potassium iodide in large doses and of thiamine is difficult to evaluate in the small number of cases thus treated The prognosis is relatively good as regards life, although with the generalized character of the disease it may be fatal in some cases

## CHILDHOOD MORTALITY FROM ACCIDENTS

Today accidents account for more deaths in childhood than almost any other cause White children under 20 years of age dying annually from accidents include 34 129 boys and 14,916 girls, and for the nonwhite group 5,976 boys and 2,990 girls This gives a sex ratio, boys to girls in the white group, of 2 2 and for the nonwhite group a sex ratio of 2 0 Nonwhite infants of both sexes suffer from fatal accidents more than twice as often as white infants In the age group 5-9 years, white boys show twice as many accidents as white girls Between 15 and 19 years white boys suffer nearly four times as many fatal accidents as white girls, and among nonwhite children the boys have a still higher ratio In a differential study George Wolff[1] shows that the death rates for accidents are highest in infancy, lower in the preschool and lowest in the elementary school age These rates rise again in adolescence with the beginning of occupational life

The high rates in the first year of life are due largely to mechanical suffocation, obstruction suffocation or puncture by ingested objects Although the total death

1 Wolff George Deaths from Accidents Among Children and Adolescents, Child **9** 83 (Dec.) 1944 Childhood Mortality from Accidents Children's Bureau U S Department of Labor

rate for accidents is high in infancy when compared with other age groups, it loses much of its significance through the greater prevalence of other causes of death at this age, such as premature birth, pneumonia and influenza, congenital malformations, injury at birth and diarrhea and enteritis In preschool age, school age and adolescence accidents become increasingly predominant because of the great decline in deaths from tuberculosis and acute infectious diseases After infancy the most important causes of accidental deaths in childhood are motor vehicle accidents, drowning, burns, injuries by firearms and injuries by falls

The racial differential in fatalities from accidents is not great except for the infant year, when nonwhite children suffer twice as high a death rate as white children, in all other age groups of childhood the ratios of nonwhite to white range between a minimum of 1 1 and the maximum of 1 4 Motor vehicle accidents occur consistently more often among white children of all ages The same is true for accidental drowning among the preschool and younger school children A consistently higher death rate exists for nonwhite children of all ages for food poisoning, conflagration and accidental burns and for other accidental poisoning and for injuries by firearms Differences between the sexes for fatal accidents are more striking than those between the races These differences can be explained by differing risks, behavior and susceptibilities of the sexes that may be inborn or acquired For example, the boys are more daring and even foolhardy, the girls are more timid and mature earlier, both physically and mentally

## Current Comment

### THE DIAGNOSIS OF CHRONIC BRUCELLOSIS

Brucellosis is one of the most important of the "new" diseases discovered in recent times by bacteriologic methods As emphasized by Harris,[1] brucellosis should receive consideration early in the diagnosis of obscure illness Unfortunately there is as yet not available any easy adequate specific means of diagnosis of chronic brucellosis The agglutination test is of significance only if positive A positive intradermal test indicates increased sensitivity, but it does not tell whether the infection is still active Negative skin tests have been observed in active brucella infection The opsonophagocytic test requires perfect technic with a virulent Brucella strain Increased phagocytosis with a positive skin test, the symptoms suggesting brucellosis, points to a still active infection The only definitely diagnostic procedure is isolation of Brucella by culture from the patient This concerns one of "the most difficult of all bacteria to isolate," and the cultural methods now in use are hardly practicable for daily routine work in the clinical laboratory The actual frequency of arthritis in brucellosis is not known The facts at hand point to a high incidence Of 157 arthritic patients observed by Goldfain[2] about half were believed to have brucellosis also Of 427 patients with brucellosis studied by Harris,[1] 74 had atrophic or hypertrophic arthritis Harris reports in detail 2 remarkable cases of advanced progressive atrophic arthritis, close study of which pointed to brucellosis as a factor Treatment of these cases included brucella vaccine and was followed in 1 case by cure, in the other by improvement in progress when the report was made Systematic study of the relation of brucellosis to chronic arthritis should be promoted Among localizations of chronic brucellosis are those in the female genitourinary tract Here tubal brucellosis appears to be of frequent occurrence but of infrequent recognition A better understanding of various chronic infections certainly requires more adequate cultural study, with special reference to the detection of brucellosis The importance of this infection calls for the organization of cooperative investigations of the problems of diagnosis and treatment

### FOURTH OF JULY FIREWORKS INJURIES

For five consecutive years from 1937 to 1941 inclusive the American Medical Association collected statistics relating to Fourth of July accidents resulting from fireworks and explosives The published analyses of these statistics were widely used in campaigns throughout the country to promote legislation banning the use of fireworks and for a safe and sane Fourth With the end of the war indications have come from several sources that fireworks manufacturers contemplate renewed campaigns to distribute explosives for use in celebrating Independence Day If this occurs, the inevitable result will be a great increase in the number of avoidable accidents from this source Consequently THE JOURNAL this year is resuming its collection of data on fireworks injuries Questionnaires are being sent to hospitals throughout the country, and their cooperation in the careful recording of fireworks injuries and prompt return of the information is urgently requested

### OUTLINE OF VITAMIN DEFICIENCIES

There appears in this issue (pp 666 and 667) an outline of the changes in the body resulting from vitamin deficiencies and their effective treatment This material has been prepared by the Council on Foods and Nutrition in conjunction with medical nutritionists familiar with the clinical detection of vitamin deficiency The signs and symptoms given in the outline represent current authoritative opinion as regards the stigma of vitamin lack As stated in the introductory comment, present knowledge does not justify the characterization of many of these changes as conclusive or pathognomonic, particularly when observed as an isolated finding Rather the abnormal finding should be considered as suggestive of the presence of a deficiency the existence of which should be corroborated by the finding of other changes and a history of dietary inadequacy

### AVIATION MEDICAL EXAMINERS

A class of medical officers who have successfully completed the Aviation Medical Examiners' Course were recently graduated at the AAF School of Aviation Medicine, Randolph Field, Texas Brig Gen Eugen G Reinartz, commandant of the school, presented the diplomas

### AWARDED MERITORIOUS UNIT PLAQUE

The Meritorious Unit Service Plaque was recently awarded to the Pasadena Regional Hospital, Pasadena, Calif, for superior performance of duty in the maintenance of a high standard of discipline during the period Oct 1 1945 to March 31, 1946 On May 15, 1946 the Pasadena Regional Hospital became a general hospital and was renamed McCormack General Hospital It will become a plastic surgery and ophthalmologic center

### ARMY AWARDS AND COMMENDATIONS

#### Captain Donald W Cheff

Capt Donald W Cheff, Wilmington Del was recently awarded the Silver Star and the Bronze Star, posthumously The Silver Star was awarded to Captain Cheff for action on April 16, 1945 on Iwo Shima, the day he lost his life. The citation told how he landed with a platoon of his collecting company twenty-five minutes after H hour and set up a collecting station on the beach He led his litter bearers inland through heavy small arms fire and then returned to the beach, where he learned that casualties were mounting and that because of the long arduous litter haul there would be extended delay in evacuation By that time two ¼ ton ambulances had been landed Although Captain Cheff had been informed that the road to the regiment was insecure, heavily mined and under constant small arms fire, he personally led the ambulances to the battalion aid station, working through continuous enemy fire over a mine-strewn road He evacuated 8 casualties to the beach and then led the ambulances back and loaded them with 8 more casualties While proceeding back to the beach on the second trip, the ambulance in which he was riding struck a mine which killed all occupants

The Bronze Star medal was awarded the medical officer for action on Leyte on Dec 13 1944 During intense fighting troops suffered so great a number of casualties that it was impossible for litter bearers to evacuate the wounded from the battalion aid station because all routes to the rear had been cut off There existed only a route across 300 yards of rice paddies, waist deep in water Captain Cheff obtained an amphibious tractor to cross the paddy, directed it to the aid station and fearlessly accompanied it to the front lines where men had not yet been treated Dr Cheff graduated from the University of Nebraska College of Medicine, Omaha, in 1937 and entered the service June 20, 1942

#### Colonel Durward G Hall

Col Durward G Hall, formerly of Springfield, Mo, was recently commended by Lieut Gen John C H Lee U S Army, commanding who said Prior to your departure from the Mediterranean theater it is desired to commend you for the outstanding manner in which you performed your assigned mission of investigating the redeployment and utilization of medical department personnel in this theater Although assigned a definite War Department objective, you approached our medical problems with an open mind and visited every medical activity within the theater to determine by intimate contact our requirements to fulfil the assigned mission of this theater In spite of the exhausting nature of such a thorough survey in a limited period of time, you devoted many hours to acquainting individuals with the War Department redeployment policies and answering questions of personal interest to the individual Your keen perception and sound judgment resulted in recommendations to the War Department for adequate medical personnel and facilities to meet minimum occupational requirements These fair recommendations, which were made as a result of your searching survey, would not have been possible without an intimate knowledge of the problems presented"

Colonel Hall was also commended by Robert P Patterson, Secretary of War, who wrote 'I learn that you are about to terminate your tour of duty in the Surgeon General's Office following completion of your mission to the European and Mediterranean theaters and I wish to take this occasion to express to you my appreciation of the services which you have rendered over the past four months in assisting me in speeding up the release of medical department officers from the Army This work has been of an unusually valuable character and has been a direct aid to me in my discharge of the personal responsibility which I assumed last fall in this matter I wish to commend you officially for it'

Colonel Hall also received the Legion of Merit Accompanying this award was a citation stating, in part Col Durward G Hall, while serving in the Office of the Surgeon General in connection with personnel service from April 1942 to August 1945 was largely responsible for establishing numerous valuable personnel procedures His outstanding achievement in bringing great numbers of urgently needed doctors to the armed forces was an effective contribution to the welfare of the sick and wounded of World War II Dr Hall graduated from Rush Medical College Chicago, in 1935 and entered the service Jan 2, 1941

#### Major Bernard S Klauber

Major Bernard S Klauber, New York was recently authorized to wear the Army Citation Ribbon by direction of the Secretary of War for performance of meritorious service while serving as assistant chief of the neuropsychiatric service, Kennedy General Hospital Memphis Tenn, during the period January 1945 to December 1945 'Despite acute shortage of psychiatrists, Major Klauber cheerfully sacrificed virtually all his time and effort to achieving his mission His unselfish devotion to duty reflects great credit on himself and the military service' Dr Klauber graduated from New York University College of Medicine, New York in 1933 and entered the service Sept. 14, 1942

#### Captain Charles Marguiles

The Purple Heart and the Oak Leaf Cluster were recently presented to Capt Charles Marguiles New York, for wounds received on June 7 and June 9, 1944 during the invasion of Normandy Dr Marguiles graduated from New York University College of Medicine, New York in 1933 and entered the service Jan 23, 1941

#### Colonel Joseph M Hayman Jr

Col Joseph M Hayman Jr, Cleveland, was recently awarded the Legion of Merit for his outstanding work as chief of medical service at the Army's Tropical Disease Center, Moore General Hospital Swannanoa, N C Dr Hayman graduated from the University of Pennsylvania School of Medicine Philadelphia, in 1921 and entered the service in January 1942

#### Captain David Hadley

Capt. David Hadley Indianapolis was recently awarded the Bronze Star for going to an ambushed signal corps group and giving first aid, and for helping to rescue two airmen from a fallen plane and giving them first aid Dr Hadley graduated from the Indiana University School of Medicine, Indianapolis, in 1940 and entered the service April 27, 1942

# NAVY

## NAVY AWARDS AND COMMENDATIONS

### Commodore Thomas B Magath

The Legion of Merit was recently awarded to Commodore Thomas B Magath, Rochester Minn for exceptionally meritorious conduct as investigator for and adviser to the Surgeon General of the Navy on matters of sanitation and tropical medicine as navy representative on the Interdepartmental Quarantine Commission and as navy quarantine officer He visited many of the principal countries of the world helping to lay a foundation for future quarantine practices with special reference to air traffic' Dr Magath graduated from the University of Illinois College of Medicine Chicago in 1920 and entered the service June 21, 1941

### Lieutenant Commander Russell M Jensen

The Navy Unit Commendation Ribbon was recently awarded to Lieut Comdr Russell M Jensen San Diego Calif The citation read 'By virtue of your services in the unit during the above period (Dec 7 1941) you are hereby authorized to wear the Navy Unit Commendation Ribbon which is transferred herewith This authorization has been made a part of your official record in the Bureau of Naval Personnel The commendation is issued by direction of Chief of Naval Personnel W C Palmer Jr Lieutenant Commander U S N R' Dr Jensen graduated from Northwestern University Medical School Chicago in 1936 and entered the service Feb 4, 1941

### Captain Aclpfar Arell Marsteller

The Legion of Merit was recently awarded to Capt Aclpfar A Marsteller Chevy Chase, Md 'for exceptionally meritorious conduct in the performance of outstanding services to the government of the United States in successive positions as organizer and medical officer in command of the Naval Mobile Hospital Number Six in New Zealand as medical officer in command of Navy Base Hospital Number Six in the advanced area as Medical Officer in command of the United States Naval Hospital San Leandro Calif and as special assistant in neuropsychiatry to the chief of the Bureau of Medicine and Surgery Because of his professional qualifications in neuropsychiatry and psychiatry and his unusual ability to organize and administer naval hospitals, Captain Marsteller was selected to establish the only neuropsychiatric hospital in the advanced areas and to reorganize two other hospitals in which the majority of patients were suffering from neuropsychiatric conditions Suggesting improved methods for the treatment of combat fatigue, he helped to make rehabilitation possible for a large number of cases and by his professional advice and experience rendered service of inestimable value on the Clemency Board Captain Marsteller's devotion to duty throughout his many assignments contributed to the health and welfare of personnel of the United States Naval Service" Dr Marsteller graduated from the Medical College of Virginia Richmond, in 1906 and entered the service Sept 14 1921

### Captain Albert M Snell

Capt Albert M Snell Rochester, Minn, was recently commended by the Secretary of the Navy for meritorious performance of duty as chief of the medical service United States Naval Hospital Oakland, Calif, from March 20, 1944 to Nov 5 1945 An inspiring leader and teacher, Captain Snell rendered invaluable service in efficiently administering the medical work at this hospital despite the tremendous turnover in patients Outstanding in the field of internal medicine, he was highly regarded by civilian leaders in this field in the San Francisco area and, by his important work with these specialists, brought great credit to the Naval Medical Corps Captain Snell's untiring devotion to the care of the sick and injured was in keeping with the highest traditions of the United States Naval Service" Dr Snell graduated from the University of Minnesota Medical School, Minneapolis, in 1918 and entered the service Dec 26, 1941

## THIRTY-EIGHTH ANNIVERSARY OF NAVY NURSE CORPS

The Navy Nurse Corps on May 13 celebrated the thirty eighth anniversary of its establishment In recognition of the occasion, Secretary of the Navy James Forrestal sent the following congratulatory message to Vice Admiral Ross T McIntire, Surgeon General of the Navy

"On the thirty-eighth anniversary of the Nurse Corps, I want to express on behalf of the Navy Department my congratulations to the Corps for its able performance in the war and its continuing activity in peace

'To the Nurse Corps may be attributed a substantial share of credit for the Navy's low death rate of casualties Throughout the war at advanced bases afloat and in the air, as well as at home navy nurses carried on their vital work with patience devotion fortitude and skill in the best traditions of their profession and of the Navy'

## LONG ISLAND COLLEGE OF MEDICINE COMMENDED

A Navy Department certificate of commendation was recently awarded to the Long Island College of Medicine for its part in training officers for the Medical Corps under the Navy C V-12 program

# VETERANS

## VETERANS' APPOINTMENTS

Dr Charles R Hess, Philadelphia, recently accepted an appointment in the Department of Medicine and Surgery of the Veterans Administration He will assume the duties of physician in tuberculosis at the Veterans Administration Hospital, Oteen, N C

Dr Elmer P Sauer, Pittsburgh, recently accepted an appointment in the Department of Medicine and Surgery of the Veterans Administration He has assumed the duties of tuberculosis specialist at the Veterans Administration Hospital, Dayton, Ohio

Dr Irving Pine Binghamton N Y recently accepted an appointment in the Department of Medicine and Surgery of the Veterans Administration He has assumed the duties of physician in tuberculosis at the largest Veterans Administration Tuberculosis Hospital, Oteen, N C

Dr Charles J Kaufman, Denver, recently accepted an appointment in the Department of Medicine and Surgery of the Veterans Administration He has assumed the duties of chief of the tuberculosis section at the Veterans Administration Hospital, Castle Point, N Y

Dr Neville H McNerney, formerly of Cleveland, has been appointed medical director of the Veterans Administration branch office number 6 with headquarters at 52 South Starling Street, Columbus Ohio He will have jurisdiction of the Veterans Administration activities in Ohio Kentucky and Michigan

## HOSPITAL CORPS VETERANS

Ruth O Kirkland, national secretary of the National Association of Veterans of the Hospital Corps, recently stated that this organization is setting up local chapters all over the states and is urging that doctors, hospitals and industry as a whole hire these medically trained veterans through the national headquarters office, 1705 M Street N W, Washington 6, D C, or through the local chapters of the National Association of Veterans of Hospital Corps

The National Association was chartered Aug 14, 1945 in the District of Columbia Those eligible for membership are honorably discharged hospital corpsmen of the Navy and Coast Guard and medical corpsmen of the Army

# ORGANIZATION SECTION

## THE PRESIDENT'S REORGANIZATION PLAN

**A Statement from the American Medical Association on President Truman's Reorganization Plan No 2 of 1946, Submitted by R L Sensenich, M D, Chairman of the Board of Trustees, to the House Committee on Expenditures in the Executive Departments, June 11, 1946, in Connection with Hearings on H Con. Res 151**

*(As indicated in an editorial in* THE JOURNAL *May 25, President Truman's Reorganization Plan No 2 proposes among other things to transfer to the Federal Security Agency (1) the Children's Bureau exclusive of its Industrial Division from the Department of Labor, (2) the functions of the Secretary of Commerce, the Bureau of the Census and the Director of the Bureau of the Census, with respect to vital statistics, including statistics on births deaths marriages divorces and annulments and (3) the functions of the United States Employees Compensation Commission The plan will become effective sixty days after the date on which it was submitted to the Congress (May 16) unless the Congress sooner rejects it by a concurrent resolution H Con Res 151, submitted by Representative Pittenger, Minnesota proposes to reject the Plan)*

The American Medical Association is interested in the changes proposed in Reorganization Plan No 2 of 1946 The physician is of necessity, interested in anything that may affect the health or provision of good medical care to patients individually and collectively in groups These groups may vary in number from small geographic divisions or those suffering from certain diseases to the entire population of the nation

Governmental public health measures are especially directed to those health problems which because of their nature or extent cannot be met successfully by the individual and must be dealt with by systematized social means The major portion of public health activity is therefore directed to disease prevention In more recent years however there have been government grants-in-aid to provide help or to stimulate interest in meeting special health needs As pointed out in the message from the President these activities have been widely scattered in the governmental machinery

The American Medical Association has repeatedly recommended concentration of governmental medical activities under a single administrative agency The American Medical Association has constantly emphasized the fact that the level of the health of the public is dependent on biologic conditions i e the human body, its functions and diseases and also on sociological conditions of living, food housing sanitation education and research and available facilities for normal physical and mental development. Physicians are therefore interested in all the divisions discussed in the proposed reorganization

The American Medical Association has through its House of Delegates, adopted a National Health Program in which local government agencies, state governmental agencies, the federal government, educational and research institutions and voluntary groups and philanthropic health agencies may cooperate within their proper spheres in striving for a level still higher than our present attainment of the best health in the world.

[A copy of the National Health Program of the American Medical Association was introduced into the record.]

The American Medical Association has been in almost constant contact with most of the governmental agencies having to do with health activities and has cooperated fully within the scope of policies agreed on

The evident advantages of consolidation of widely scattered activities prompted the Board of Trustees in January 1937 to make the following recommendation

'The Board of Trustees of the American Medical Association would recommend that such health activities as now exist be so consolidated in a single department which would not however be subservient to any charitable, conservatory or other governmental interest

"It has been repeatedly said that public health work is the first problem of the state It is the opinion of the Board of Trustees that health activities of the government except those concerned with the military establishments, should not be subservient to any other departmental interests This reorganization and consolidation of medical departments need not under present circumstances, involve any expansion or extension of governmental health activities but should serve actually to consolidate and thus to eliminate such duplications as exist. It is also the view of the Board of Trustees that the supervision and direction of such medical or health department should be in the hands of a competently trained physician, experienced in executive administration

The House of Delegates of the Association approved the action of the Board of Trustees The House of Delegates in 1938 reiterated its demand for a federal executive department to be designated as the Department of Health, with a doctor of medicine at its head who shall have general supervision and direction of the affairs of the federal government pertaining to the health of the people

In 1944 the House of Delegates approved a resolution recommending that the functions of the Children's Bureau of the Department of Labor be transferred to the United States Public Health Service

In the same session of the House of Delegates a resolution was adopted requesting 'the Congress of the United States to create a Department of Public Health the head of which department shall be a cabinet officer and to assign to such department all health activities of the federal government' This action was recommended in that it would result in greater efficiency and in increased benefit to the American people.'

In 1945 a resolution before the House of Delegates pointed out that the United States Public Health Service carries out its activities in prevention of disease and protection of the public health through state departments of health and other state agencies It was stated that the health services now conducted by the Children's Bureau of the Department of Labor parallel, and in many instances overlap the responsibilities of the Public Health Service and require duplication of district facilities and personnel and a confusing duplication of federal relationship with state health departments and other agencies in the field of public health

It further stated that "it would be more logical, more effective and more economical to have all public health responsibilities concentrated in one federal agency and establish one direct channel of relationship with state health departments"

The resolution as approved recommended that the health services of the "Children's Bureau of the United States Department of Labor should be transferred to the federal Security Agency until such time as the Congress creates a National Department of Health with a qualified physician as its director, with cabinet status

The transfer of the vital statistics functions of the Census Bureau to the Federal Security Agency would seem to be logical and make for greater usefulness of that service, as it is of more importance to the agencies of health and welfare than to the Bureau of the Census to which it is now attached

The repeated resolutions of the House of Delegates leave no doubt that the medical profession represented in the American Medical Association favors the concentration of all medical activities of the federal government in one governmental agency with a qualified doctor of medicine at its head, this administrator to have the general supervision and direction of the affairs of the federal government as they pertain to the public health The administrator should have cabinet status or if this is not possible at this time, he should have direct access to the cabinet level and should not be subordinate to another agency The health of the people is too important in maintaining the 'strength of the nation' as it was referred to in the message of the President to be subject to economic restrictions administrative limitations or policies developed by other agencies

With the average life expectancy practically at 65 years agencies primarily engaged in providing nonmedical benefits, aid and old age insurance will be involved in such enormously large administrative and financial volume that it would be extremely difficult to keep the more individualized problems of health in proper perspective

The American Medical Association has directed its efforts for nearly one hundred years toward making the best possible medical service available to all the people and cooperates with governmental and other agencies toward that end

It has been intimated that the proposed changes in organization are planned as the initial step in establishing a regimented government controlled system of medical care. We are inclined to accredit to this effort the honesty of purpose that has activated the efforts of the American Medical Association in supporting or opposing other legislative proposals

Should it be apparent that efforts are directed to the establishment of governmental regimentation or measures that would be harmful to the quality of medical care the American Medical Association will oppose those efforts with all the means at its command

---

## Washington Letter

*(From a Special Correspondent)*

June 17, 1946

### Graduate Training and Medical Research Center Planned by Army

Major Gen Norman T Kirk surgeon general of the Army has announced plans for the erection of a vast graduate training and medical research center at Forest Glen Md The center will be at National Park College which served as a convalescent home during the war for Walter Reed hospital patients A request for funds will be included in the 1947 budget but as yet no estimate of cost has been announced. General Kirk believes the project will take about twelve years to complete Tentative plans call for inclusion in the center of a 1 000 bed clinical hospital the institute of pathology the Army Medical Museum institutes of research medicine and dentistry and of research and radiation therapy and a 250 000 volume library General Kirk has also revealed that the 1 000 000 volume Surgeon General's Library will occupy a building to be started soon near the Capitol The 1 000 bed hospital and the institute of pathology will be started first. General Kirk made the announcement at a press preview of the exhibit covering all war developments and service which will be shown in San Francisco at the annual session of the American Medical Association

### Witnesses Criticize Provisions of Maternal and Child Welfare Act

Witnesses appearing before the House Subcommittee on Aid to the Physically Handicapped criticized provisions of the Maternal and Child Welfare Act Mrs Eugene Meyer, wife of the publisher of the Washington *Post* said the bill would defeat a coordinated national health and welfare program and cut across the President's reorganization plan Dr Joseph S Wall, chairman of the medical staff of Children's Hospital spoke on behalf of the American Academy of Pediatrics and declared that the bill merits the unanimous disapproval of the medical profession He said the measure has the potentiality of wreaking destruction on the teaching and practice of obstetrics and pediatrics and the possible obliteration from the practice of medicine of their adherents, with the consequent evil influence on the welfare of the mothers and the children of our country" Dr Joseph H Howard of the American Medical Association said 'We do not believe that services and facilities should be available to all who elect to participate regardless of economic status We do not believe that authority for such a vast program should be vested in the chief of the Children's Bureau who would have power to veto any state program and cut off federal aid force adoption of Children's Bureau standards of medical care and administration and establish maximum remuneration for all professional participants We do not believe that enactment of this bill will improve the quality of maternal care'

### Request for Jury Investigation of Abuse of Veteran Patients

The Veterans Administration and the Department of Justice have asked for a federal grand jury investigation into alleged abuse of patients in three Veterans Administration mental hospitals United States attorneys have been instructed to proceed with criminal prosecution of attendants at Veterans Administration hospitals in Togus Maine Northampton Mass and Marion Ind accused of brutal and bullying conduct All cases were first investigated by special undercover agents of the medical department of the Veterans Administration and their reports prompted an appeal to the Department of Justice

### Sixth Science Bill Introduced in Congress

Representative Wilbur Mills Democrat of Arkansas, has introduced the sixth bill on scientific research to be presented to Congress reportedly for the purpose of heading off enactment of the joint Kilgore Magnuson bill which was worked out as a compromise after a long trip through Senate committees The original Science Foundation bill was introduced by Kilgore and a more conservative measure incorporating ideas of Dr Vannevar Bush of the office of Scientific Research and Development was submitted by Magnuson Later they reached a compromise, which was endorsed by five thousand scientists Slated for consideration in May the joint measure was sidetracked by strike troubles The new Mills bill is described as much closer to the original Magnuson bill It would eliminate research in the social sciences and cut out a provision for appropriating 25 per cent of government funds for research among states with the cash to be spent in land grant and tax supported colleges It would also eliminate the proposal that patents developed in government financed research remain the property of the government available without charge to any one

### Former Presidential Physician Surveys Mine Health

Rear Admiral Joel T Boone of the Navy Medical Corps was named by Interior Secretary Krug to direct the survey of hospital medical sanitary and housing facilities in the coal mining areas covered by the contract recently granted the United Mine Workers union. Admiral Boone was formerly personal physician to Presidents Harding Coolidge and Hoover Under the agreement signed by Mr Krug as coal administrator and John L Lewis chief of the United Mine Workers a health and welfare fund is to be under the joint direction of the union and the employer

### Service Hospitals Require Blood for Surgical and Medical Cases

The American Red Cross has announced that service hospitals particularly the Walter Reed General Hospital, require whole blood for surgical and medical cases The public is reported to have lost interest in giving blood since the end of the war which has resulted in a shortage of blood for army and veteran hospitals An appeal has been issued for donations of blood

### Veterans Administration Clearing Up Hospital Cases

As an illustration of how the Veterans Administration is speeding up its work the Washington Regional Office reports that last month all 151 hospital or domiciliary care applica-

tions received were disposed of before May 31 The board had 2434 disability pension or compensation cases pending at the end of the month, while 19,524 running awards were being made

### Lieutenant Colonel Frank E Hamilton Heads Walter Reed Hospital Staff

Brigadier Gen George C Beach Jr, commandant of Walter Reed Medical Center, announces that Lieut Col Frank E Hamilton of Columbus, Ohio has been named chief of staff of Walter Reed General Hospital here succeeding Col Reed Bowers of Frederick Md, who is returning to inactive duty to resume teaching at Cornell University Medical College Colonel Hamilton is a former assistant professor of surgery at Ohio State University College of Medicine and is a veteran of the Normandy campaign He comes here from the England General Hospital, Atlantic City

### Work Started by Hospital Council

The newly formed National Capital Area Hospital Council has started operations with William R Castle president of Garfield Hospital, elected president By laws have been adopted Formation of the unit was completed just prior to the final report of the Metropolitan Health Council of the Council of Social Agencies which reiterated its criticism of Washington hospital facilities

## Medical Legislation

### STATE LEGISLATION

#### Louisiana

*Bills Introduced*—H 614 proposes an appropriation to the department of institutions for the purpose of providing for the care and treatment in privately owned hospitals, of indigent or destitute sick persons in areas throughout the state wherein no state hospital is maintained or operated for such purpose. S 162 proposes to require the Louisiana State University to make available medical care and hospitalization to each member of its teaching staff on payment of surgeons and medicine and hospital fees at the same rate charged to students of said institution S 185 is similar to H 688 previously reported It proposes to authorize any state board commission or board of governors to proceed by injunction to enjoin and prohibit any person from the practice of any profession required to be licensed by said board commission or board of governors when such person is practicing such profession and has not been granted a license S 234 is similar to H 672 previously reported It proposes to require all persons applying for a license to marry to file a certificate signed by a physician duly licensed to practice by the Louisiana State Board of Medical Examiners which certificate shall state that the applicant has been given an examination including a standard serologic test for syphilis made not more than fifteen days prior to the date of issuance of such license, and that in the opinion of said physician, the person either is not infected with syphilis or if so infected, is not in a stage of such disease which is or may become communicable to the marital partner

*Bills Passed*—S 126 passed the senate June 11 It is similar to H 644 previously reported To amend the law relating to the practice of pharmacy, it proposes among other things, to define the term "prescription' as including orders for a drug or drugs or a chemical or chemicals or medicines or combinations or mixtures thereof transmitted to pharmacists through word of mouth, telephone telegraph or other means of communication by a duly licensed physician, dentist veterinarian or other medical practitioner licensed to write prescriptions intended for the treatment or prevention of disease in man or animals, and such prescriptions received by word of mouth, telephone telegraph or other means of communication shall be recorded in writing by the pharmacist and the record so made by the pharmacist shall constitute the original prescription to be filled by the pharmacist"

#### Massachusetts

*Bills Passed*—H 1898 passed the house June 5 It proposes the creation of a board of registration of opticians and defines an optician as 'a person engaged in the filling, compounding or reproducing of prescriptions of physicians or optometrists for ophthalmic lenses, eyeglasses or other optical appliances prescribed for the correction of defective vision or ocular anomalies of the human eye, and the mounting and fitting of the same to frames or supporting materials, and the adjusting of such lenses, eyeglasses and appliances to the use of the wearer" Exempted from this proposal would be licensed physicians and optometrists H 2001 passed the house June 3 It increases the scope of a special commission investigating certain matters relating to public education, relative to changing the name of the Massachusetts State College to the University of Massachusetts and to establishing a medical school at such institution. H 2029 passed the house June 5 and the senate June 6 This bill is similar to H 1899 previously reported It proposes that any container containing DDT be labeled in certain ways so as to protect the purchaser from being poisoned thereby S 29 passed the senate May 20 To amend the law relating to the furnishing of medical care to recipients of old age assistance it proposes that no board of public welfare or old age assistance bureau shall set a rate of payment for medical services to recipients of old age assistance that is less than the accepted rate for medical services in the community in which the recipient lives unless the physician is willing to accept a payment for his services less than the accepted rate S 533 passed the house June 10 It proposes to provide for a departmental study relative to the regulation of certain hospitals, sanatoriums, convalescent homes and nursing homes by the department of public health

*Bills Enacted*—H 66 has become chapter 51, resolves of 1946. It extends to December 1946 the life of an investigation being made by the department of public health for the purpose of studying the decay of teeth resulting from a lack of fluorine. H 1317 has become chapter 390 of the Laws of 1946 It provides that all medical records and reports of hospitals, clinics and physicians of either the insurer or the employee shall be filed with the Industrial Accident Board and shall be open to the inspection of any party

## Medical Economics

### SCHOOLS TO DEBATE MEDICAL CARE PROGRAMS

The Committee on Debate Materials and Interstate Cooperation of the National University Extension Association has just announced that the proposition to be debated in the high schools throughout the country next year has been selected as follows

*Resolved* That the federal government should provide a system of complete medical care available to all citizens at public expense

This proposition was chosen in a nationwide referendum of debating leagues out of more than eighty topics submitted by high school and college students and teachers The selection was finally narrowed to three topics Medical Care, Labor Legislation and World Government Of these three the Medical Care proposition was chosen by a wide margin

The selection of the Medical Care question as the official proposition for debate next year means that it will be debated and discussed in every state in the Union both by high school and by college students from the public platform as well as over the air It will be the subject of extensive study by thousands of young people who will take both the affirmative and negative side of the proposition

Professor Bower Aly of the University of Missouri has been appointed to edit *Medical Care The Twentieth Annual Debate Handbook* for the use of students engaged in the debates The *Debate Handbook* will be available on or about the first of September

# THE WAGNER-MURRAY-DINGELL BILL

## Hearings on S 1606—To Provide for a National Health Program

(NOTE.—*This is a condensation of the verbatim report of the hearings*—ED.)

*(Continued from page 617)*

United States Senate Committee on Education and Labor

MAY 2, 1946

THE HONORABLE JAMES E MURRAY Presiding

PRESENT Senators Murray, Smith and Donnell

*(Senator Murray introduced a statement from the California C I O Council about the California Physicians Service Plan.)*

### Statement of James B Carey Secretary-Treasurer, Congress of Industrial Organizations Accompanied by Robert K Lamb, Legislative Representative of the United Steel Workers of America

*(Mr Carey restated most of the points made by the Physicians Forum.)*

MR CAREY As your committee appreciates the testimony we are presenting will be made available to our members and it is for that reason that we are doubly glad to be able to make the foregoing quotations from the Physicians Forum We want our members to know that a group of leading physicians agree with us that this legislation is not only desirable in principle but on the whole well drafted to achieve its purposes

In the face of the general nationwide demand for passage of this bill we cannot believe that efforts of certain entrenched individuals at the top of a few organizations can block its passage The broadcasting of misrepresentations over the last several years has begun to boomerang and the groups these individuals influence are talking compromise. There should be no compromise short of an adequate federal compulsory health insurance act

SENATOR DONNELL Had you personally had anything to do with the preparation of this testimony to be given by Mr Murray? MR. CAREY Not in the actual writing but in the policy determinations yes And I participated in the discussions that took place in the policy meetings

SENATOR DONNELL Who actually prepared this? MR CAREY Mr Murray with the assistance of Bob Lamb who is beside me this morning

SENATOR DONNELL Mr Lamb is an attorney, is he not? MR LAMB I am an economist

*(Senator Donnell questioned Mr Carey's evidence to support his statement that the American people want S 1606 Mr Carey said he based it on the actions of C I O membership.)*

SENATOR DONNELL Have you taken a poll of the American people? MR. CAREY May I first finish my answer?

SENATOR DONNELL On the question of whether or not they believe they can get better medical care under S 1606? MR CAREY Certainly

SENATOR DONNELL When did you take that poll? MR CAREY In our political action work.

SENATOR DONNELL That is the Political Action Committee? MR. CAREY That is our political action work Senator

SENATOR DONNELL That is the Political Action Committee of the C I O? MR CAREY That is a small part of our political action work Senator

*(Senator Donnell continued to question about a poll and Mr Carey continued to evade the answer.)*

SENATOR DONNELL Mr Carey I think perhaps now the meaning of this question is at least permeating your brain The question I am asking you is have you taken a poll p-o l l poll Have you taken a poll of the people of the United States on this question? MR. CAREY Yes sir

SENATOR DONNELL When did you take it? MR CAREY We take it constantly, day in and day out, through the channels of our organization

SENATOR DONNELL Have you sent out any questionnaire of any kind? MR CAREY Now you are getting down to something

SENATOR DONNELL You did not have any idea of what I meant? Is this the first time you had any idea of what I meant? MR CAREY Is that your definition of a poll Senator?

SENATOR DONNELL Mr Carey— MR CAREY You asked me a question I asked you to define what you said

SENATOR DONNELL I will put my question— MR CAREY You know that Gallup takes a poll and Crosley takes a poll The C I O has no poll of that type As to your questioning my credentials representing the C I O I say we know the thinking of our people that authorized us to support this legislation

SENATOR DONNELL I want to say this Mr Carey You may have credentials I do not know what they are or what is their nature but I want to say to you you do not have any credential to act for me and I am one of the members of the American people MR CAREY Are you a member of the C I O?

SENATOR DONNELL I am not MR CAREY I will modify my testimony

SENATOR DONNELL Just a minute MR CAREY And I will say that the American people with the exception of one single solitary Senator wants better medical care

SENATOR DONNELL That is not the question I asked you Of course I want better medical care MR CAREY Senator you do not happen to be the American people

SENATOR DONNELL I think I am one of them MR CAREY You are no more the American people than I am

SENATOR DONNELL I want to say to you Mr Carey that my question is perfectly simple and you have understood it all along Have you sent out a questionnaire? If you cannot understand the meaning of the word poll have you sent out a questionnaire to the American people as such to ascertain whether or not they believe they can get better medical care under S 1606? Have you sent it out? MR CAREY May I—

SENATOR DONNELL Have you sent out such a questionnaire? Just answer that question please sir MR CAREY Are you trying to harass me Senator

SENATOR DONNELL I am asking a question MR CAREY Are you trying to frighten me?

SENATOR MURRAY Gentlemen I do not think we are making any progress here

SENATOR DONNELL Apparently not

*(Senator Donnell continued to question and Mr Carey continued evasively.)*

MR LAMB I am legislative representative for the United Steel Workers of America of which Mr Philip Murray is president

SENATOR DONNELL Were you with a government department before you worked for the C I O? MR. LAMB I worked for the Senate and the House of Representatives but I never worked for an executive agency of the government

SENATOR DONNELL You worked for the Senate and the House of Representatives and now you are a member of the C I O? MR LAMB That is right.

*(Senator Donnell questioned Mr Lamb about voluntary insurance plans.)*

MR. LAMB Well, Senator, the two outstanding ones of which I have any knowledge are the California Physicians Service and then one in Michigan and I do not profess to know much about the one in Michigan As to the general coverage that is to say, the 5 million or so, and perhaps it is as high as 7

as I understand it the state and local medical societies are responsible for about one million and between five and eight hundred thousand at the present time of the people covered.

SENATOR DONNELL Yes? MR LAMB Under special plans, as I am describing, and that includes I believe, the California Physicians Service

SENATOR DONNELL Very well May I ask you this Do you know whether or not the California Physicians Service recently entered into an arrangement, whether final or not I am not informed with the Grange, whereby approximately 100 000 members of the Grange are to come in under the operation of that plan? Do you know whether or not that has been tentatively or perhaps finally arranged? MR LAMB I do not know sir

*(Senator Donnell questioned Mr Carey on the provisions of the bill relating to the advisory council and free choice of physicians and specialists)*

*(Senator Donnell also questioned Mr Carey and Mr Lamb on the cost of operation of S 1606)*

*(Senator Donnell questioned Mr Carey about the Physicians Forum The only one he knew was Dr Boas)*

*(Mr Carey indicated his belief that doctors have been misled about S 1606 and said that he felt eventually they would come to support it)*

SENATOR DONNELL May I ask you this This is a matter of curiosity which perhaps has no bearing on the bill Does the C. I O have not only organizations among government workers, federal government workers, but does it also have them among state government workers? MR CAREY Yes, sir

SENATOR DONNELL And does it also have them in some of the banks of the country? MR CAREY Yes sir

SENATOR DONNELL You have local C I O organizations in banks? MR CAREY We have now an international union covering public employees federal state city county and so forth We have the organization of the United Office and Professional Workers which covers white collar workers in that particular field That includes bank clerks and others

SENATOR DONNELL You conclude your statement with a paragraph the second sentence of which reads The sums now spent annually for the medical care of the American people today would amply cover the benefits provided in this bill" Who is it that has made the requisite computations on which that statement was based in your organization? MR CAREY We sought information regarding the present health bill of the system and the services rendered and the payment of that amount of money We also compared with that the cost of the operations under the principles contained in this bill if enacted, the estimated costs and we find that the people of this country will be eligible for greater benefits with less money than they are at the present time

SENATOR SMITH Do you think there is any country that provides medical service comparable to the medical service that we give to the people in this country? MR CAREY There is no country in the world that can compare with this country in any of these questions whether it is housing or clothing or medical care or whether it be education or production or any of those other features But I do not think any other country in the world makes expenditures in this field of health to the extent of our own country and no other country to my knowledge wastes so much in failing to bring about a better relationship between doctor and patient

SENATOR SMITH That of course is a matter of opinion. We can be dogmatic in drawing such a conclusion MR CAREY I would think that the experiences we have had in these important fields such as education and health could well be used and that is where we get our experience and that is why we so vigorously support this bill We recognize it as a present step in the right direction There can be no question anywhere in the world but that under our system of government and the flexibility we have in meeting the problems of the people we can do this job I would have liked to use in the testimony some of the information that was brought about as a result of our participation in the last war the great number of rejects the tremendous costs I would not attempt to measure what the price was in terms of life or even in dollars, but certainly there is indication here that we do not have as good a balance as we could have Some areas are more depressed than others in terms of having medical care available to the people

SENATOR SMITH Your conclusion is that you think we can do it better by centralized experiments than by continuing our state experiments, as we have during the years, and decentralizing our operations MR CAREY I would say the system suggested here as to the overall policies is the only thing that is actually determined by the federal government

SENATOR SMITH And you do not take cognizance of the experiment in Minnesota, which I am told has made great progress, and the experiment in California, a system whereby we are getting combined judgment of different areas trying different things to move toward perfection as fast as we can. Is that not the best way to do it? MR CAREY That is the best way to gain experience, and as a result of that experience in the systems we have had operating, such as that in St Louis operating under the direction of the labor organizations, the people have better medical services now than they had before But still we think that experience itself is good argument in support of Senate bill 1606

SENATOR SMITH So you think we have got to the end of the experimental stage We have got to perfection now and we can write the blueprint here in the central government rather than encourage these different states and medical societies and boards of health to go on trying to perfect it in their own areas? MR CAREY The enactment of this bill would in no way put a stop to experimentation and further development

SENATOR SMITH That is where I disagree with you MR CAREY Senator I would say, if we refused to enact this legislation, that in itself would be an indication that we believe the present situation is a perfect one

SENATOR SMITH Let me correct you on that As to my thinking along the line of grants-in aid to your states, I am for that I think the first part of this bill contemplating grants in aid proceeds along the right line I would like to see it perfected in certain respects But when you get into part 2 you are in a totally different philosophy, and that is where I have difficulty in following you But I am glad to hear you say that that is your opinion We want to get the opinion of the C I O MR CAREY The American Medical Association and others operate on that central basis as we do because they find in many cases you can best render service in that way

SENATOR SMITH It is a matter of degree how far you can decentralize administrative powers To my mind that is the issue we have here, that of determining the right kind of a bill to report out

MR LAMB I would like to refer Senator Smith to the letter which Mr Carey put into the record, because I recognize it as being a copy of one I have here which came to us a day or so ago from the secretary treasurer of the California C I O council in which he has reference to the California Physicians Service and he has this to say with respect to their experience And our California C I O as you know, has been among the pioneers in the C I O in its interest in medical care our California C I O and the American Federation of Labor out there have worked together in the recent past on this He says The C I O in California has had considerable experience with voluntary plans We have studied with particular care the statewide plan of the doctors California Physicians Service We are completely convinced that this type of plan can never bring good medical care to those who need it most, the middle and lower income groups I am listing below the principal reasons which have led us to this conclusion Many of these faults are inherent in all voluntary plans Of course this does not have reference to the state plans but to the California Physicians Service, which I believe you mentioned a moment ago, which has been in force for some time

SENATOR SMITH I mentioned it, Mr Lamb as one of the experiments which is going on today I would have no objection if some state wanted to try a compulsory plan to see whether it would work better than the voluntary plan

MR LAMB I would like to list these points first, Senator

1 C P S costs too much for the service given Administrative and acquisition costs are very high and are not subject to control by the membership or any public body The tremendous turnover in voluntary membership destroys the actuarial integrity of the plan The cost of selling the plan is tremendous These two factors negate the advantage of the insurance principle of spreading the risk According to C P S figures in the months of October and November a total of 27 489 new members were acquired The net gain in membership however was only 2 349

2 The coverage is too limited C P S offers only surgical and hospital coverage to the majority of members Medical care is not offered to families The day to day medical and dental expenses of the average family are not met Many members of C P S report annual medical expenses of hundreds of dollars despite their C P S coverage Preventive medicine has not any part in the C P S plan

3 The quality of care is poor C P S physicians tend to treat C P S patients with less care than private ones C P S is totally unable to control professional standards and practices of its physicians In the C P S housing projects program completely controlled by the doctors the average quality of care was so poor as to be scandalous The large turnover in membership is largely due to dissatisfaction with the service

4 C P S cannot control overcharges by member physicians These doctors are not satisfied with C P S fees and attempt to collect additional fees from the patient Hundreds of complaints on this score have reached us from members of the C P S

5 C P S does not encourage the growth of group practice The benefits of pooling skills reducing costs etc which make a group practice desirable are lost to C P S members

6 C P S does not seek bona fide consumer representation on its controlling board The plan is completely dominated by physicians Members have nothing to say about dues medical coverage or administration C P S seeks to perform a vital public function while controlled by a very small minority the physicians Unlike a government body C P S has no responsibility to the people and cannot be controlled by them

7 C P S has not shown good faith in an honest attempt to devise means to make medical care available to all It is openly admitted by the California Medical Association that C P S was created and is maintained in an attempt to prevent the enactment of health insurance legislation This very attempt is proof that the physicians are aware of the need for health insurance and the desire of the people to have it

8 C P S failed utterly to prove its soundness in the largest mass attempt to provide care on a prepaid basis In the housing project program C P S demonstrated that voluntary enrolments are doomed to failure C P S and the California Medical Association officially demanded of the government that membership of public housing tenants in C P S be made compulsory Their contention was that only thus would the plan succeed

SENATOR SMITH If I may just suggest this at that point I see those defects but I am not convinced that the plan which you are advocating here S 1606 would cure those defects better than if we did try to experiment with those things as we met them in different parts of the country

SENATOR MURRAY We may concede that the states have rights and will continue to have them but I think too that a program of this kind can be more effectively administered under a national law We find often that while states have rights, they do not always exercise them in the interest and welfare of the people For instance states have rights to set up utility commissions to control utilities in various states of the Union and yet because of the power and influence of the interests in those states those rights are not honestly and fairly administered in the welfare of the people So it seems to me that we should not brag too much about states rights because they have not always been administered in the interests of the welfare of the people.

SENATOR DONNELL I want to place myself on record as recognizing and thoroughly rejoicing in the fact that we do have states rights under the Constitution of the United States and the Tenth Amendment thereto

SENATOR SMITH Mr Chairman I think we have expressed a difference in philosophy here that is legitimate as a part of this whole question Can this best be done through federal control or through decentralization to the states? If we differ on that I want to say that I appreciate Mr Carey s testimony and that of Mr Lamb I have had contact with Mr Lamb before and I have the highest regard for him in the work he is doing for his cause I disagree with him but respect his judgment

SENATOR MURRAY I think such discussions will be helpful in studying this question when we go into executive sessions

SENATOR PEPPER This bill owing to the fact that the Senate cannot initiate tax measures contemplates the plan assuming the existence of the money but I think everybody has contemplated that a payroll tax is the basic method by which the funds that will provide this in an insurance shall be provided

SENATOR SMITH It is your theory then that there would be such legislation? SENATOR PEPPER Yes I have always understood that this bill is generally predicated on there being a payroll tax of 1 5 per cent required to be paid by the employees and 1 5 per cent being required to be paid by the employer, which would be analogous to the payroll tax which is today collected of employer and employee to provide for a national fund

SENATOR DONNELL Does the Senator understand that it is contemplated that this 1 5 per cent on the employer and employee would pay all the expenses of the fund or that there would be a federal subsidy in addition? SENATOR PEPPER Senator the only way we could answer that would be by experience It might be that with this fund the preventive health services the general health care that might become available the clinical diagnosis that might become possible for people so that illness might be nipped at its beginning or may be prevented from beginning might so reduce the medical bill of the country that 1 5 per cent by employer and employee would prove to be enough If it were not enough we in the Congress would have to decide whether we would wish to raise the amount of the payroll tax or make up the difference by a federal subsidy That is just a mere matter of policy But what I wanted to emphasize is this We all have good doctor friends whom we highly respect and admire whose professional skill we esteem Some people seem to take this bill and our advocacy of it as a personal affront to them as a sort of trespass on their prerogatives an invasion of their sacred precincts Now, what I have been trying to get into my mind is the essential and basic character of this bill What I am asking you is Do you people not regard that it will do if it is financed as I have said by the sort of payroll tax I have described as a national compulsory insurance program whereby the people may, with one another provide funds through which they may procure medical services And is it not essentially a tax and compulsory insurance program? MR CAREY I stated that in my testimony Senator

*(Senator Pepper by his questions indicated that the people would be taxed compulsorily but that doctors could participate voluntarily )*

SENATOR SMITH May I ask you a question there with relation to your observation? Supposing you put through the compulsory plan and then are short on doctors what is your solution? How are we going to handle that? SENATOR PEPPER There are two answers, Senator One is that this bill encourages the training of more doctors

SENATOR SMITH That is very worthy SENATOR PEPPER Right that is very worthy In the second place, do you not think that if doctors have an opportunity for a fair fee under favorable surroundings such as adequate equipment and assistance and that sort of thing and to render a good quality of medical care do you not think with regard to the law of demand and the desire to make money as well as to render humanitarian service that is going to provide the doctors needed? SENATOR SMITH I think so but I think that comes back to the point you made I think unless you have the profession with you you will not get the cooperation you need

SENATOR PEPPER I am only asking the question Senator as to whether when the burden of this thing is to be paid for by the people and the people are the ones whose lives and whose health and whose dear ones are involved and when the people feel that they want to pay this money whether we ought to let a little handful of doctors who are not directly affected deter us from serving the people or permitting them to save and to serve themselves? SENATOR SMITH This is where I disagree with you on your thesis Assuming you are going to have the doctors available to handle this matter that you have persuaded the people to pay for

SENATOR PEPPER Well is it the case that these doctors are going to refuse to render medical service to the people when they are paid for it that they are going to strike? SENATOR SMITH I think they are going to suggest it can be worked out through your state boards more effectively than through a federal plan That comes back to the basic philosophy I am just raising some of the difficulties I see, and I think you will agree there are difficulties

SENATOR MURRAY There is one organization of doctors who have had a representative here before the hearing a short time ago who had as one of their objects the idea of organizing the doctors not to enter this system In other words they are proposing a sitdown strike on the part of the medical profession against the effect of enforcement of this law in case it becomes a law I do not know whether they will abandon that idea or not but they have sent out literature

to that effect and the doctors that are joining that organization are joining it with the understanding that that is one of the objects that they have in view

SENATOR PEPPER Mr Chairman lest some one might misunderstand my attitude, I want to say that I do not have the slightest idea that a handful of doctors in this country would ever think of doing such a thing as that There may be a few people that are excited now, whose emotions are stirred up now, who are deeply moved by this matter, largely because they misunderstood it.

SENATOR MURRAY I think it is largely misunderstanding

SENATOR PEPPER Right They have been made to misunderstand it, most of them I do not have the slightest misgiving about the doctors giving hearty cooperation, and what will happen is that once we get this thing under way administratively there will be difficulties that will develop and when we pass this bill we may find there are things which should not have been put in there But experience will teach us how we can perfect the bill You need have no worry about what will happen. As we go along we will learn and the doctors will become our counselors you mean ours but they will become the counsel of the administrative agencies that are running it In a little while you could not any more repeal it, once it becomes law, than you could repeal the Unemployment Compensation Law or the Social Security Law or any other

SENATOR MURRAY I think that is a correct statement. Mr William Green of the American Federation of Labor testified a short while ago and he called attention to the Workmen's compensation law, which was bitterly fought by the medical profession at the time it was proposed, and they argued then that that would destroy the medical profession But since that time they have come to recognize the value of that law and now would not think of recommending its repeal

SENATOR DONNELL Mr Chairman, it was mentioned by Senator Pepper that this bill does not require physicians to come in under it I think that is quite true I want to mention this however that obviously in order that this plan may succeed it would be essential that the great majority of the physicians in our country did come under it. Therefore, we are going to be as a practical matter confronted with the situation that if the people that pay in these taxes are to get their money's worth out of it the great majority of the doctors must come in—I do not mean legally they are not compelled to legally—and then we are going to be confronted with the economic question which worries many people as to whether the great majority of the profession that will come in under this system will discourage personal advancement and initiative or whether it will bring about deterioration of service I think all of those problems are involved I take it this is not the time and place to argue those questions, but that is involved

## Statement of Martin H Miller, National Legislative Representative, Brotherhood of Railroad Trainmen

I am Martin H Miller National Legislative Representative of the Brotherhood of Railroad Trainmen

MR. MILLER The Brotherhood of Railroad Trainmen is the largest of the railroad train service labor organizations and represents conductors and brakemen road, passenger freight and yard—train baggagemen yardmasters dining car stewards, switchtenders, car retarder operators and operators of intercity busses

*(Mr Miller described the development of the health plan of the brotherhood)*

SENATOR MURRAY Well, now you will notice that this is a very extensive piece of legislation and has many provisions in it Are you able to analyze these and discuss them or do you wish merely to confine your testimony to the overall problem of the need of the National Health System to provide better care, better medical care for the people of this country on a reasonable cost? MR MILLER Senator, I am not prepared to go into detailed discussion as to the several provisions in the bill In preparing my statement I prepared it generally

*(Mr Miller, in reply to Senator Donnell felt that government should provide food full employment etc)*

SENATOR MURRAY Now, with reference to this problem of food you do not mean that the obligation is on the government to furnish everybody directly with food but your idea is that with reference to the children who are unable or whose parents are unable to feed them properly in the tender years when they are going to school the government should provide some plan for additional feeding for them in the schools? MR. MILLER That is right. Certainly

SENATOR MURRAY In reference to this health program, you believe also that people should be required to pay for medical care and hospitalization when they are able to do it, but it should be supplied to them at reasonable cost so that they may be able to avail themselves of it without too much hard ship? MR MILLER That is correct. Certainly

SENATOR DONNELL Mr Miller, so that I understand just your theory in view of the examination by the chairman, this matter of full employment it was the President's program with respect to full employment that you feel Congress responded to in a very feeble way MR MILLER That is right

SENATOR DONNELL Do you personally favor the government guaranteeing to each person in the country that if that person desires to work he shall have a job or, failing a job shall be paid some type of unemployment compensation by the government? Is that your position? MR. MILLER Yes Definitely I think that each individual has a right to live.

SENATOR DONNELL And you feel that that is a governmental obligation, as I have outlined either to furnish the person with a job or give him unemployment compensation if the job is not at hand? MR MILLER I would say it just a little differently That it would so direct the economy of the country that work—either private or government work—would be available, or, in the absence of both, then unemployment compensation to tide them over

SENATOR DONNELL And you think that should be a national function emanating from the national government? MR. MILLER Well, naturally, I would think it should be a national function. We found out on the railroads that you just could not operate the state unemployment laws to take care of railroad employees adequately You see, members of the Brotherhood of Railroad Trainmen oftentimes run into and through four states

SENATOR DONNELL Yes? MR. MILLER In the course of their tour of duty, so you see you just cannot recognize those imaginary state lines because they cross them The same thing is true of highway workers It is true of operators of airplanes and we just have some places that we cannot recognize state lines

SENATOR DONNELL So you feel that this is a federal governmental function? MR. MILLER Yes, I think it is a federal responsibility

SENATOR DONNELL Yes? And in this matter of insufficient food, the chairman, Chairman Murray mentioned food in the schools. Now, if a child should not have sufficient food in his home, as distinguished from the school, because he does not do nearly all of his eating at school if he did not have sufficient food in his home, would you advocate that the government should see that food should be provided to him in his home? MR MILLER I think it is an obligation of the government to see that that child grows up to be a normal human being just as mentioned in the President's state of the Union message, and as we all know, it proved to be costly to the federal government to have so many millions of young men rejected and it certainly becomes an obligation of the federal government, because, after all, the federal government, when it leans back on the people in national defense, if it does not have healthy people it does not have much to lean back on.

SENATOR DONNELL So you regard it as an obligation of the federal government to see that the child is sufficiently fed to grow up to be a useful citizen of the country? MR. MILLER That is right

SENATOR DONNELL And if that food is not furnished at home or in school or wherever it may be, you feel it is the obligation of the federal government to see that the food is furnished? MR MILLER That the child grows up to be a normal healthy human being

## Statement of Edward F Poss, Grand Worthy President, Fraternal Order of Eagles

*(Mr Poss said the Eagles had always favored a complete security program)*

MR POSS In making an alternative suggestion to federalized prepayment of medical care I am not labeling the method proposed in Senate bill 1606 as "socialized medicine." For years local lodges of the Fraternal Order of Eagles have provided free medical services to members and their families just as many industrial establishments now do

Some Eagle aeries have maintained a panel of prepaid physicians for over forty years Many Eagles have received medical

attention for themselves their wives and youngsters that otherwise they might not have had or been able to afford But we would have to admit that, even when there is a panel of several outstanding medical men in the community serving the local aerie a majority of our members in any lodge seemed to prefer to have their own family doctor They may be the better off members, from a financial or income standpoint, but the idea of selecting their own doctor and themselves paying for his services appeals to them

Insurance social or private to an average American still means reimbursement for a loss or expense protection against an uneven and unpredictable risk

In asking amendment of Senate bill 1606 to provide some alternative method of cushioning the economic shock of paying for needed preventive and curative services and hospital care we are not placing our reliance on voluntary systems They are fine But those who need them least are most likely to take out the policies Those who need the protection most are the least likely to have it

SENATOR DONNELL In what respects do you think that this bill S 1606 should be amended so as to guarantee the independence of the medical profession MR POSS Well in the opinion of the Fraternal Order of Eagles and mine I feel that the average independence of the man is in knowing that he can pay his own bill In other words that the money should be paid to the insured policyholder For instance, if I carry a sickness and accident insurance policy the check is sent to me. It is not sent to the doctor Then I pay the doctor We feel that in order to make any bill work especially this particular type of bill you must have a cooperative feeling and a spirit on the part of the doctors and by placing him directly or indirectly on the federal payroll you eliminate his independence SENATOR DONNELL You think the bill should be amended? MR. POSS That is right In the opinion of the Eagles, we feel that the money should be paid to the man who is sick, he, in turn to pay the doctor

SENATOR MURRAY Well let me ask you there How would that have the effect of guaranteeing the independence of the physician? MR. POSS Well Senator Murray in that case the man who is ill is going to receive the check and he could choose any doctor out of the 5 000 or 6 000 we have in Toledo I have learned down through the years that when we have doctors in our home it is a pretty sacred thing with a child and a wife. We have pretty close association with the family doctor

SENATOR MURRAY But this bill provides in every community where it is put into operation a panel of the physicians and surgeons who agree to come under the plan and who will have their names listed then the people in the community would have the right to elect to go under the care of any member of that panel MR. POSS That is right

SENATOR MURRAY And when he becomes sick, it provides that the doctor that he selects will take care of him and he will be paid out of the fund. A fund will be created and set aside out of the wages of the workers and sent in to a separate fund, and out of that fund the doctor will be paid. Now if you require that fund to pay it to the individual and then the individual to pay it to the doctor you are going to create a lot of more bookkeeping, which does not serve any purpose as far as I am able to see. MR. POSS Well of course, that is a debatable question.

SENATOR DONNELL You say on page 5 but I doubt that the average Eagle or average American is equally enthusiastic about having doctors and nurses become direct or indirect federal employees, paid by the government. I understand from that that your interpretation whether it is correct or not your interpretation of this bill as it is now written is that inasmuch as the money is collected and the person goes to the panel and gets the doctor and the government pays the doctor, your interpretation is either directly or indirectly that these doctors and nurses are federal employees MR. POSS That is correct

SENATOR DONNELL And you think the bill S 1606 should be remedied and amended so that the payments should be made direct to the patient and then the patient go and select whatever doctor he or she may want That is your thought? MR POSS That is my thought.

SENATOR MURRAY Regardless of what his fees would be? MR POSS I am wondering if we can place a price on our responsibility to our fellow men

MAY 3 AND 4 1946

HONORABLE JAMES E MURRAY Presiding

PRESENT Senators Murray, Ellender and Donnell

## Statement of General Omar N Bradley Administrator, Veterans' Affairs

GENERAL BRADLEY The bill imposes no duties on the Veterans Administration Therefore I think I can be more helpful to the committee by outlining the program and experience of the Veterans Administration in the field of medical care Veterans have reason to take pride in the hospital program established for them While the proposals contained in S 1606 would not appear to be designed to impair in any way the hospitalization benefits now administered by the Veterans Administration I wish to state clearly that in my opinion it is important that nothing be done which will impair it I also believe that this veterans' benefit should continue to be under the exclusive jurisdiction of the Veterans Administration

The bill does not specify any particular method of financing the program By use of the term prepaid personal health service benefits it would appear that contribution by the employed person is anticipated. This would require the veteran to contribute toward a benefit to which he is already entitled without charge under existing law in that he is entitled without cost to himself to hospital or outpatient treatment of service connected disability and to hospital treatment of non-service connected disability when bed is available This effect bearing in mind possible impairment of the existing program should be considered carefully at such time as the financing procedures are worked out.

In passing it is noted also that the bill would limit the period of hospitalization whereas under the laws administered by the Veterans Administration there is no such limitation The period of hospitalization is determined by application of medical principles

Since March 3 1919 when the acquisition of government hospitals was first authorized for the treatment of veterans of World War I to Dec 31 1945 there have been 3 315 780 admissions to hospitals of United States veterans The average period of hospitalization for a general medical and surgical patient was 38 6 days for a tuberculous patient 173 9 days for a neuropsychiatric patient 54 7 days for a psychiatric or mental patient 370 4 days During March 1946 54 464 applications for hospital or domiciliary care were received The total number of patients remaining in all hospitals the last Thursday of March was 84 730

As of March 31 1946 the Veterans Administration had 101 hospitals There is a Veterans Administration hospital in every state in the Union except three—New Hampshire Rhode Island and Delaware The construction of hospitals in each of these three states has been authorized

By the enactment of Public Law 293 79th Congress approved Jan 3 1946 the Congress authorized the establishment of a Department of Medicine and Surgery in the Veterans Administration. With the authority of this law we have made a complete and drastic reorganization of the Veterans Administration medical service The selection of personnel to staff Veterans Administration hospitals has been greatly expedited and the medical service is attracting outstanding specialists and medical personnel of the highest quality

The Veterans Administration is currently authorized to spend over 400 million dollars in the next two years in hospital construction The vastness of this program is understood more readily when it is stated that more money will be spent for veterans hospital construction in the next two years than was spent in the entire preceding twenty-six years In connection with the hospital construction program of the Veterans Administration I wish to refer to the problem of staffing our hospitals A hospital without a staff obviously is utterly worthless In order to secure suitable professional personnel to staff a hospital a general medical hospital must present a sufficient variety of problems in medical treatment to attract the best quality of medical personnel and to interest younger medical personnel For this among other reasons the program of medical care for non-service connected disabilities is an important factor in the Veterans Administration hospital program Furthermore, a medical staff must be maintained to the highest efficiency and in the maintenance of high professional efficiency the variety of disabilities among the patients is again an essential factor

The Department of Medicine and Surgery in the Veterans Administration is initiating new and greatly expanded programs Arrangements have been made with medical and research centers to provide the Veterans Administration with

consultants visiting staffs and residents in hospitals located near these centers A staff of nationally known specialists has been appointed to serve as Veterans' Administration consultants A special program has been instituted for the rehabilitation of blind veterans and for those with impaired hearing An extensive program of research in prosthetic appliances is under way A committee of outstanding citizens has been appointed to advise the staff personnel in charge of this program, and it is expected that the Veterans Administration will soon assume leadership in this highly important field

The Veterans Administration is giving serious thought to the care and rehabilitation of veterans with neuropsychiatric and mental disabilities It is planned to bring nationally and internationally known psychiatrists into Veterans Administration neuropsychiatric hospitals on temporary duty As most of the Veterans Administration neuropsychiatric hospitals are remote for medical schools, it is proposed to obtain outstanding psychiatrists for a few days or a week at a time who will lecture to the hospital staff and bring members of the staff up to date in the latest developments in the field As an extension of the Veterans Administration program of outpatient care, mental clinics are being established throughout the country Sixteen have already been organized thirty two have been authorized and plans are under way for the eventual establishment of two hundred mental hygiene clinics.

It is noted that S 1606 makes provision for medical research The Veterans Administration is also interested in developing an extensive research program As an agency which has access to the health records of millions of veterans over a long period of years it should be able to render great service in the field of medical research The Tumor Research Unit at the Edward Hines Junior Memorial Hospital, Hines Ill, has made elaborate studies in this field and has some of the finest equipment in the world

In view of the large number of troops stationed in tropical areas special research is being done in tropical diseases Centers for this purpose have been established in the Bronx, New York Biloxi, Miss San Francisco and Washington D C. A system of resident training is being instituted which together with plans for graduate work and special training for members of the staff will greatly increase the proficiency of the staff

In passing I may say that the program of education and vocational rehabilitation authorized by Public Laws 16 and 346, 78th Congress will enable veterans who desire to enter the medical profession to take such training at government expense

Another part of the Veterans Administration medical program has to do with outpatient treatment The law provides that veterans with service connected disabilities shall be given outpatient treatment for such disabilities During February 1946 outpatient medical care was provided 152 381 persons Of this number 62 107 received treatment and 90 274 were examined It became clear that new measures must be resorted to if the demand for outpatient treatment and examination was to be handled adequately The Veterans Administration therefore has developed a plan whereby contractual agreements may be entered into through the cooperation of state medical societies for services of physician members to furnish medical care on a fee basis

I will refer only briefly to the domiciliary care afforded by the Veterans Administration To be eligible for admission to a home in addition to other requirements unnecessary to mention here a veteran must be suffering with a permanent disability tuberculosis or neuropsychiatric ailment be incapacitated from earning a living and have no adequate means of support. This benefit will become more important as veterans become older and undoubtedly it will be in the future, as it has been in the past, a refuge for many veterans in periods of economic distress On June 30 1945 there were 8 779 veterans in domiciliary status Of this number 4 10 per cent were veterans of World War II As of March 28 1946 there were 11 682 veterans receiving domiciliary care

The program of medical care administered by the Veterans Administration is designed for a special group of citizens and is subject to certain specific limitations I feel that it is a program in which the country takes great pride and one that has been beneficial to all the people of the country, as veterans form a considerable portion of the population Great progress is being made in improving medical service extended to veterans and the American people can well take satisfaction in this program

SENATOR MURRAY I believe that you know that the President recently sent a letter to me in connection with this matter I think it would be appropriate for me to read it at this time, it is as follows

Dear Senator Murray

It has been most gratifying to observe the deep interest displayed and the progress made by the Senate Education and Labor Committee under your chairmanship in the conduct of the hearings on S 1606 the bill designed to give legislative effect to a large part of the national health message which I submitted to the Congress on Nov 9 1945

In providing generally for medical and hospital services under S 1606 it is intended that these most essential and valuable benefits be within the reach of those persons who are not eligible for medical and hospital services under existing laws and be afforded to some persons already eligible therefor in whole or in part who for various practical reasons do not have such services made readily available The latter aspect of the program is deserving of special attention to remove any doubts as to the real effects intended by the proposed legislation.

It is not intended that existing programs of medical and hospital services are to be supplanted For example it is not intended that our obligations to veterans for medical and hospital care shall be changed or impaired in either service connected or non service connected cases The special provisions for veterans under laws administered by the Veterans Administration reflect our nation s gratitude for their services and I urge that when the bill emerges from your committee it provide in explicit terms for the preservation of medical and hospital services under laws administered by the Veterans Administration

A national health program such as I have recommended and as envisaged in S 1606 would make it possible for persons to get complete medical and hospital services locally As to veterans the program would merely provide additional means of securing medical and hospital care. Veterans with non service connected disability in common with others, would become entitled to outpatient treatment As to persons eligible under other laws particularly veterans the program under S 1606 would include the families of such persons for complete medical and hospital services which benefit is not now available to them

I have conferred with the administrator of veterans affairs and the federal security administrator and they share in my convictions.

HARRY TRUMAN
President of the United States

In view of that recommendation on the part of the President, could you propose to us some amendment which would make it possible to achieve the purpose that the President has in mind there in protecting the veterans' program? GENERAL BRADLEY We have not one prepared at this time We will work on it.

SENATOR MURRAY Now under the existing conditions, it is not possible for the Veterans Administration to provide medical care adequately for the veterans all over the country, is it? GENERAL BRADLEY We are able to take care of all service connected cases and a limited number of non service connected cases At present about 85 per cent of those in general medical and surgical hospitals are non service connected and about 15 per cent are service connected We have a waiting list at the present time of approximately 26 000 I believe

SENATOR MURRAY So that a national program of health care in the country which would be open to the veterans and to their families would be a great help GENERAL BRADLEY It would certainly furnish an additional means of veterans getting medical service.

SENATOR MURRAY And the important matter would be to prevent it from supplanting or in any manner interfering with the existing veterans program? GENERAL BRADLEY Yes, sir The point we are trying to make here is at the present time particularly the disabled veterans They are entitled to hospital care without contribution THE CHAIRMAN Yes GENERAL BRADLEY And we feel that while a contributory system such as outlined here, although it is not outlined as to how he will pay while it would provide medical care for his family, he himself would not be getting any additional service by contributing to the system

SENATOR MURRAY In other words he is already entitled himself to the care that the bill would provide? GENERAL BRADLEY Yes and to unlimited hospitalization for whatever length of period his sickness requires

SENATOR MURRAY So that you believe that it would be appropriate to provide some amendment which might protect the veterans in that right and not in any manner undermine the veterans program? GENERAL BRADLEY I do not know enough about it to know whether or not an amendment to this bill is necessary but when it comes down to setting up the machinery for these people to pay, then is the time, I think, you must be careful you do not charge, particularly a disabled veteran for something he is entitled to In fact all veterans are entitled to a certain amount of hospitalization

SENATOR MURRAY I see Then some program outside the veterans program would be a great help to the family of the veterans in the way of providing medical care and hospitalization for them? GENERAL BRADLEY Well, I should think so I am not qualified to pass on the benefits of the hospitalization of the whole population, I am afraid. I have been studying it only from the point of view of the veteran himself

SENATOR ELLENDER How would you suggest that we take care of the family of the veteran? GENERAL BRADLEY Well, that is a thing, I think, you would have to work out as I understand, in some second part of this bill, where you are going to set up the machinery and the method of financing it I think it has to be considered very carefully

SENATOR ELLENDER I am just wondering how it would be possible to separate the veteran himself from his family, if it is the desire to aid the family You would have to do it possibly on the basis of charging a veteran less than you would the individual who is not entitled to the services under the veterans program? GENERAL BRADLEY Either that or you may make this contribution dependent on the number in the family, in which case he would be excluded, possibly as one of the family

SENATOR DONNELL General, would you prefer that medical and surgical services for dependents of veterans should be administered under the facilities of the Veterans Administration rather than some other facilities? GENERAL BRADLEY No sir

SENATOR DONNELL You would rather not have them? GENERAL BRADLEY We would rather not because we do not believe we can take care of that large a load

SENATOR DONNELL General by the use of the term 'program" as contained in the chairman s question, there might be an ambiguity I understand, as I think the chairman indicated, in the first place you are in favor of the general desire of the President to see that adequate measures of some kind be taken for the public health? GENERAL BRADLEY That is right

SENATOR DONNELL But as to whether or not S 1606, this bill would accomplish those results satisfactorily you are not undertaking to testify? GENERAL BRADLEY I do not feel qualified to say

SENATOR DONNELL General going back for just a moment to the veterans do you feel that it is wise that the Veterans Administration itself shall provide complete medical care for veterans including non-service connected disabilities? GENERAL BRADLEY The question of furnishing complete medical service is dependent on two things SENATOR DONNELL Yes, sir? GENERAL BRADLEY First the desire of Congress to build that many hospitals and pay that much for it. Second on whether or not you will ever be able to get enough doctors for full time service with the government to staff that many hospitals

SENATOR DONNELL Would you regard it as desirable, General that a veteran receive medical care under two different programs, as for illustration have his military wound cared for in a veterans hospital and his treatment for some other disability of a lung nature, for instance cared for in another hospital? Would you favor that? GENERAL BRADLEY I do not think that would be necessary, because a man with a service connected disability is entitled to both hospitalization and outpatient service and with the program we are working on now we would be able to furnish that outpatient service reasonably near his home. In a serious ailment, or periods when he has to have hospital care, that would be furnished in a veterans' hospital not too far away, after we have these new hospitals constructed We believe in general he would prefer to have that outpatient service furnished by us in his own community or in one of our hospitals At least we believe we can make that hospital service second to none and one a man would be proud of

SENATOR DONNELL And I take it you would favor the idea of the veteran following through and having his treatment under the Veterans Administration and this outpatient service, if sufficient funds are granted by Congress, to bring that about. GENERAL BRADLEY That is right

*(General Bradley described the arrangements made with various medical societies)*

SENATOR DONNELL General, in reference to the fact that the Veterans Administration has developed a plan whereby contractual arrangements may be entered into through the cooperation of the state medical society for services of physician members, medical care on a fee basis have you generally speaking, found the state medical societies to be cooperative in affording the services to be of help and assistance in these matters? GENERAL BRADLEY As far as I know we have run into no difficulty on it There may be difficulties I have not heard about yet, because we have arranged it in only a few states so far It takes time. We can furnish that for the record if you would like the number of states we have arranged this with, and there are any number of states that may have refused to do so

SENATOR MURRAY Have some states refused to do it? GENERAL BRADLEY I say if they have Mr Birdsall tells me there are seven that have already signed up

SENATOR MURRAY In your negotiations with the various medical societies you find that each society has proposals of its own and it is necessary for you to carry on negotiations with them to work out a program In other words you do not submit one single program to the medical societies and ask them to accept it, but you negotiate independently with each medical society in each state? GENERAL BRADLEY Yes

SENATOR MURRAY For the service that is to be rendered? GENERAL BRADLEY And, as I understand it and this is all done by the medical section, and I have not gone into many of the details, but I have talked with them and as I understand it the fees vary in different parts of the country and different states for different methods of control, so it is necessary to deal with each state separately

SENATOR MURRAY Who is in charge of those negotiations that you mention in your setup? GENERAL BRADLEY I believe Dr Harding is in charge

SENATOR MURRAY Dr Harding Who is the head of the medical staff? GENERAL BRADLEY Dr Hawley

SENATOR MURRAY They are both members of the American Medical Association? GENERAL BRADLEY Yes, sir

SENATOR MURRAY Have you encountered any resistance from these medical societies in any states against this program whereby you negotiate with them for service on the veterans fee schedule? GENERAL BRADLEY It has not been called to my attention

### Statement of Fred Bailey, Legislative Counsel, the National Grange, Accompanied by Mr Lloyd C Halvorson

*(Mr Bailey described the resolutions of the Grange in behalf of extending medical services It included grants-in-aid to help where need could be shown)*

MR BAILEY Title II of S 1606 goes considerably beyond anything proposed or approved by the National Grange Moreover it is a proposed extension of federal authority and activity on which there has been no opportunity for an expression of opinion by the public generally Most of us will agree with the objectives of title II but possibly not the methods The objectives as we understand health insurance are a wider distribution of medical services universal participation as far as possible in health insurance programs provision of medical treatment for indigent groups and promotion of national health and efficiency This bill provides one approach to that problem. That approach is not in conformity with our concept of the scope of the federal government We are not at all certain that the objectives expressed in the bill would best be attained by that method Basically there are two approaches We need to choose between them One is through a continuation of our slow but steady growth of the voluntary system including the increasingly popular cooperative or group insurance. The other is through the type of a program proposed in this bill—compulsory insurance We should weigh carefully both the advantages and the disadvantages of each system—we need to choose the one which will best meet our needs It is difficult to say which is the cause and which is the result—poor health and low income If we take sound measures to improve rural health there would be a resultant economic improvement Likewise if we take proper steps to improve the income of farmers the result would be to obtain improved medical care. Probably we need to attack the problem from two directions—increased productivity and income and improved medical facilities

From the strictly medical direction which is the only one before this committee, we suggest five objectives

1 We must do something to ease the financial burden of illness so that medical and dental services are within the purse limitation of all

2 Facilities, like hospitals and health centers have to be constructed and sanitation must be improved

3 More doctors dentists and nurses must be attracted to rural areas

4 Good preventive public health services must be organized, and people must be better educated about health and disease

5 The scientific quality of rural medicine and related services must be elevated.

We are reasonably certain that if we assign this problem to the sphere of governmental responsibility it will mean probably the greatest expansion of federal bureaucracy that we have ever witnessed in peacetimes It would be difficult to estimate the number of government employees required to administer such a system It would add enormously to the cost of maintaining national health—without assurance that it would in the long run do a better job than under our present democratic system of free enterprise

Records and estimates available indicate that the number of persons directly included in such a national health insurance plan would be more than 125 000 000 All of these cases would have to go through the processes of certification filing inspection payment complaints and adjustments If an adequate staff and organization were provided it would mean an army of government employees

Under our spoils' system such an expansion in the number of federal employees could mean patronage—patronage for whatever political party was in power, patronage beyond anything dreamed of in the past patronage down into every local community in the United States

This does not necessarily condemn the proposed experiment in compulsory medical insurance but it is a factor that must be considered If we bring our doctors under federal control farmers, lawyers veterinarians and others serving the public interest may well wonder if they will be next

It is possible to expand the federal government to a point where states become merely administrative districts under direction from Washington We have traveled so far in the direction of national control over our economic life that further steps in this direction must necessarily be considered in relation to the distance we already have come

Whether it would be wise to embark on a further expansion in federal control of such magnitude with the attendant growth in patronage, is a question to which we should at least give thoughtful consideration We question whether one in a hundred persons understands the implications of this proposed expansion of federal authority into their very homes

In the ordinary relationship between patient and physician the patient of average means is anxious to shorten the period of treatment and he avoids unnecessary claims on the physician's time The physician likewise is anxious to effect a cure as speedily as possible, retain the patient's good will and build up his own professional reputation Under compulsory insurance those conditions are subject to some strange inversions There is a tendency on the part of too many people to enjoy a long illness, to run to a physician with every small or imaginary illness Some physicians, with fees based on the number of calls or patients seen, would yield to the temptation to profiteer, both at the public expense and at the expense of other patients, who might have a more legitimate claim on their time

This bill has been, mistakenly we believe, castigated as "socialized medicine" Yet it undeniably is a step in that direction. It is the natural tendency of a strong central government to seek to expand and enlarge its authority That fact is amply illustrated today in economic controls Those who seek constantly to enlarge central authority over states cities, communities and individuals do not follow the original concepts of our democracy

Compulsory health insurance is not a cure-all It is not a magic elixir for our ills A number of labor unions for example, have tried compulsory health insurance for their members and have abandoned it as ineffective expensive and unworkable There are no factual data to prove it would work on a national scale

Compulsory medical insurance is incompatible with the preservation of private medical practice The government would establish the fees and other rules and regulations governing the relations between physicians and patients Physicians books recording confidential information relating to their patients could be opened to government inspection

Compulsory medical insurance is as un-American as the Gestapo Theoretically, each physician could refuse to participate in the plan Actually, because few people would refuse to avail themselves of services already paid for in taxes the clientele left to nonparticipating physicians would be negligible.

Available experience shows that current individualistic fee for-service medical practice and tax supported medicine are incompatible It is one thing to have a patient pay a doctor for each visit or service rendered and a far different thing to have a third party make the payment

There is a parallel between public medicine through taxation and food subsidies Today we are taxing—or piling up debt to be paid out of future taxation—at the rate of two billion dollars a year to pay a part of the food bill of every American family

For tomorrow it is proposed in S 1606 we shall levy still more taxes out of which we are to build another huge federal bureaucracy to administer federal payment of medical and dental bills If we do that, where are we to stop short of taxing to meet all the needs of all the people, to make certain that every one has the same sort of a car the same sort of a house the same sort of clothes and gets to see the same movies?

It is not to be inferred from that that we oppose cooperative medicine and hospital insurance—we do however seriously question the use of compulsion Compulsion is justifiable only when it can be clearly shown—as in the case of contagious diseases—that the public interest is best served by that approach.

There has been a healthy and commendable growth in recent years of voluntary medical and hospital insurance—group insurance for those who want it There is every reason to believe that voluntary insurance of that type is in many ways more desirable and economical than the compulsory type suggested under title II of this bill

It would seem to us to be more desirable for the federal state and local governments to offer financial assistance where necessary in development of voluntary consumer cooperative insurance The financial resources of some communities undeniably are insufficient to provide adequate medical services either on a cooperative or on a fee for service basis Other communities have built up cooperative health insurance plans which they like can afford and want to keep

There is I believe too much of a tendency in Washington to want to manage the lives and activities of every one whether or not all want or need such federal supervision We believe that at this time the disadvantages outweigh the advantages Federalized medicine seems to us to be another step in the wrong direction that is, toward surrender of more state local and personal rights to a centralized federal authority There is no conclusive evidence that Washington officials have a monopoly or even a preponderance of wisdom in the nation. Yet the spread of federal authority over the past generation has occurred at a rate which should give us cause for grave concern Today one out of every seven employed persons is on the public payroll There are more people who want the federal government to support them than there are who want to support the federal government

*(Senator Murray questioned Mr Bailey and Dr Halvorson on current activities of the Grange in the field of health care)*

SENATOR MURRAY You are familiar with the reports of the Selective Service Administration which showed that as the result of ill health and defects which were found in the young men coming from the farm areas it was necessary to reject a very high proportion? MR BAILEY I believe the records on that will show a very high number were rejected for medical reasons, but a great number were also rejected for illiteracy, but the record does not distinguish between the two and psychiatric cases, where also it is questionable whether medical aid would have prevented it

SENATOR MURRAY Did you have any assistance from medical men in the preparation of the statement you presented here? Mr BAILEY I did not consult any medical men

SENATOR MURRAY Who assisted you in the preparation of your statement MR. BAILEY *Dr Halvorson* and I prepared it.

SENATOR MURRAY He is a member of the medical profession? MR BAILEY He is an economist

SENATOR MURRAY The compulsion here is the compulsion which would require everybody in the country to participate

in the national insurance program and make contributions to it for the purpose of lowering the cost to the people as a whole. MR BAILEY That is true

SENATOR MURRAY What objections have you to that kind of compulsion? That is not a compulsion that is going to injure anybody MR. BAILEY It is another form of federal control, putting another tax load on the federal government If, as intended, the tax collected from this would go, all of it, to medical care then the objection would be less A portion of that tax to be collected will go to maintain an army, practically of federal agents federal bureaus that would have to take all these cases put them through the process of certification filing, inspection, payment of claims and adjustments All of those things must be paid for from the medical bill from taxes that would otherwise go to the payment of medical bills It would increase the expenses and it would decrease the amount of money that would actually go to medical treatment

SENATOR MURRAY Have you made such a thorough analysis of this bill that you could make that as your own conclusion? MR BAILEY That is my own conclusion I think it is inescapable

SENATOR MURRAY What objection do you have to the government undertaking to provide a program whereby the people of the country would be better taken care of? MR. BAILEY I have the same objection that whereby the government would through taxation, take care of my building a house take care of my buying a car, buying my food, my clothing my railroad tickets and pay my motion picture bills

SENATOR MURRAY You have no objection to the government providing programs whereby the farmers of the country are aided and assisted in matters pertaining to livestock and care of livestock and the manner in which they should be provided for and so forth? MR BAILEY The government has undertaken that not only in the field of agriculture but in every other field of course They have been providing advice and technical assistance.

SENATOR MURRAY You think wherever the government sees where the public is not being provided for that they should give study to it and assist in some manner in bringing about a better situation? MR BAILEY Yes certainly We think the study in this case here is thoroughly justified and we think the committee is making such a study and that the committee is working toward a final conclusion and their work is very commendable

SENATOR MURRAY Do you believe that the filing of this bill has developed great interest in the country and will bring about a complete study of the situation and probably result in some very satisfactory legislation? MR BAILEY We think that the introduction of the bill and the hearings being held by the committee will add considerably to the knowledge, interest and understanding of the people on this kind of measure, and eventually will lead to solutions of the problems whereby the methods, suggestions, or otherwise will be carried out

SENATOR MURRAY You say in your statement There is, I believe too much of a tendency in Washington to want to manage the lives and activities of every one whether or not they want or need such federal supervision Can you give me some examples of that? MR BAILEY An example of that would be the controls that we have had through the Office of Price Administration a great many of them They have tried to delve back into managing the affairs of the country and as a result, we have had black markets and disregard of regulations We have built up in this country an attitude of holding the law of the land very lightly

*(Senator Murray and Mr Bailey discussed at length factors concerned in inflation)*

SENATOR DONNELL What is the total approximate membership [of the Grange] at this time? MR BAILEY Eight hundred thousand

SENATOR DONNELL The organization is composed very largely of farmers MR. BAILEY It is composed almost exclusively of farmers

SENATOR DONNELL How widely distributed over the United States is the membership of approximately 800 000? MR BAILEY We have organizations in thirty eight states We have members in most of the other states but they are not organized on a statewide basis

SENATOR DONNELL The organization holds an annual meeting does it not? MR BAILEY Yes

SENATOR DONNELL You refer to the 1945 annual meeting held in Kansas City in November 1945? MR BAILEY Yes, sir

SENATOR DONNELL How large an attendance was there at that meeting, Mr Bailey, approximately? MR BAILEY I would have to answer that in two ways, Senator The official attendance consists of representatives of each of the thirty-eight states The representatives from each state consist of the state master and his wife We then have the officers of the national convention That is the entire official attendance It is a legislative body I would say that would make up about 125 who are official attendants At various times during the conventions other people come in I think the highest number we had at one time was approximately 3 000

SENATOR DONNELL Mr Bailey, may I ask you some questions on your personal experience? What was your occupation before you became the legislative counsel of the National Grange? MR BAILEY I was national farm editor for the United Press

SENATOR DONNELL How long did you have that connection? MR BAILEY Seventeen years

SENATOR DONNELL In your connection with the United Press did you have occasion to visit a portion of the United States? MR BAILEY I visited every state in the Union with one exception as a reporter SENATOR DONNELL You became acquainted with farm problems of the country you think quite well? MR BAILEY I felt that I understood them very well, yes

SENATOR DONNELL You believe you are familiar with the sentiment of the farmers of the country? MR BAILEY Yes sir being a farmer myself

SENATOR DONNELL Do you regard the expression that is made by the annual conventions of the National Grange as fairly representative of the sentiment of the great majority of the members of the Grange? MR BAILEY I will explain to you how the resolutions are passed, Senator I believe that will answer the question better than any other way The resolutions which reach the National Grange floor first must originate in a subordinate grange, which is a local community grange It must then be passed to the county, which is a promoted grange and consists of delegates of all the granges in the country It is then sent to the state grange and must be passed there It is then sent to the National Grange Every resolution has its roots in the farm home at the local level It must come from that direction it can come from no other

SENATOR DONNELL Do you think that committee knew of the fact that there had previously been introduced a bill called S 1050 a year or two before that? MR BAILEY I think the Public Health Committee which drafted this was familiar with previous proposals

SENATOR DONNELL In other words, the proposal is generally known as the 'Wagner-Murray-Dingell proposed legislation MR BAILEY I suppose, since they have made a study of the subject that they were familiar with it.

SENATOR DONNELL As you have pointed out in your statement here title II of S 1606 goes considerably beyond anything proposed or approved by the National Grange' Is that not true Mr Bailey? MR BAILEY That is right

SENATOR DONNELL Now Mr Bailey you made reference to various voluntary organizations I am wondering if you have had it within your knowledge or called to your attention that out in California your organization has had some negotiations or possibly some contractual arrangements I am not certain which with the California Physicians Service, looking to the furnishing, by their organization of approximately 100,000 members of the Grange, of certain facilities offered to the Grange Are you familiar with that? MR BAILEY I know about it but I am not familiar with the details on it, Senator

SENATOR DONNELL You do not have that? MR BAILEY I know it is a voluntary system on which we are working

SENATOR DONNELL Has that actually been entered into between the Grange and the California Physicians Service, do you know? MR BAILEY I am not certain. DR HALVORSON I believe I have seen an advertisement to that effect

SENATOR DONNELL Your membership in California is about 100 000 is it? MR BAILEY It is approximately that

SENATOR DONNELL You also referred in your testimony, page 8, to the fact, as you state that a number of labor unions,

for example, have tried compulsory health insurance for their members and have abandoned it as ineffective, expensive and unworkable" Do you know how many labor unions have made that experiment? MR BAILEY Only two that I know of I had reports and I did not bring them with me. This is based entirely on reports which I have had and not on personal experience The International Ladies' Garment Workers was one that tried it

SENATOR DONNELL Is that a Congress of Industrial Organizations organization? MR. BAILEY I believe it is now affiliated with the Congress of Industrial Organizations

SENATOR DONNELL What else do you know about it? MR BAILEY Three or four years ago they made a report in which they said that it had been unsuccessful for several reasons It gave, as among those reasons the fact that it increased the absenteeism of their members from work because they would be off ill and receive benefits They would go to a doctor They were using the services of a doctor when it was not necessary The physicians who had made contractual relations with the organization had gypped them, in other words, to put it briefly

SENATOR DONNELL That has a bearing I take it, on the point you make in your statement and is illustrative thereof as you say in your report 'there is a tendency on the part of too many people to enjoy a long illness, to run to a physician with every small or imaginary illness" The experience of the labor unions would bear out that point? MR BAILEY Yes sir

SENATOR DONNELL Do you remember what the other one of the two labor unions to which you refer is? MR BAILEY My recollection is that it was the Teamsters Union

SENATOR DONNELL I wanted to ask you also with respect to your statement on pages 5 and 6 as to the various indicia of the fact that this would build up a very large list of government employees Now you mentioned here I think to my mind, at any rate more clearly and definitely than any other witness we have had the different types of work that employees would have to do You mention the processes of certification filing inspection and payment of claims and adjustments You figured here for something around 125 million persons I think the figures we have had here range from 107 million to 112 million But at the rate of 107 million people, and to have those functions performed by employees, with respect to 107 million it is obvious to me that your point is quite clearly well taken that it would require a very large number of employees

SENATOR MURRAY You are familiar with the fact that we already have set up in this country a social security system We have administration headquarters here in Washington That office is staffed with personnel that would take care of a lot of this work that you have mentioned here MR BAILEY I am aware that you have that setup, yes I am not familiar with how it could operate in this case

SENATOR MURRAY A large part of the office work that should be required under this system will be handled by the personnel of the Social Security Administration as it is now staffed MR BAILEY Am I to infer from that Senator, that it would not be necessary to add more people to the Social Security Board to carry this work

SENATOR MURRAY It is possible that more may be added but you approach it as though you would have to build up from a ground foundation a huge organization now to administer this particular bill MR BAILEY I was assuming that it would be handled independently of any other agency now in existence

SENATOR DONNELL If I might interpolate at this point, Mr Chairman this may be a violent assumption, but I am assuming for the purpose of argument that the time of the employees' day is reasonably well occupied and that they are not sitting around idly with a lot of vacant space or time to be filled in While they may be able to add to some extent to the duties to be performed, I would think it would be obvious that with a vast new system such as this registration, constant operation complaints and so on certainly that would have to entail more people and a great deal more work

SENATOR MURRAY Not necessarily very many more, because they already have that setup now under the present Social Security System It would merely mean a little more work not much more, because the same people to a large degree, are already involved in the Socrl Security program as we have it today All of these collections, for instance they will already be paid into the Social Security Fund, and this would be just an addition of an amount added to their contribution

SENATOR DONNELL I am pleased that the chairman has mentioned this point, as Mr Bailey has emphasized his view on it I think at some future hearing it would be helpful if we had some additional information from the Social Security Board along those lines SENATOR MURRAY We intend to present that

SENATOR DONNELL Have you ever heard of a book or publication on 'Dr Crownhart on Sickness Insurance"? MR. BAILEY I am not familiar with it.

SENATOR DONNELL My information is, though I have not seen the book, that this doctor states, in substance, that in European countries sickness insurance schemes would indicate that one government employee for each hundred insured persons is required to administer and police the insurance system.

SENATOR DONNELL This insurance plan as you understand it is one under which there is going to be a spread of that cost Some of us do not have to go to a doctor at all. Those that that is true of would contribute something more than they ever had been contributing under any plan. As to the fellow who had been spending lots of money with doctors, he would pay less MR. BAILEY How many cents out of every dollar that we pay out would go for medical care, and how many cents would go to administrative care, I am not certain of It would be a very sizable amount of it

SENATOR DONNELL That is a very important question. Now the bill itself does not contain the financial provisions, does it? MR BAILEY I have not found that it does

*(To be continued)*

## Coming Medical Meetings

American Medical Association San Francisco July 1 5 Dr George F Lull 535 N Dearborn St Chicago 10 Secretary

American Academy of Tuberculosis Physicians San Francisco June 30. Dr Oscar S Levin P O Box 7011 Denver 6 Colo Secretary

* Delayed report Week ended June 1, Maine 1 case.

**Institute of Biology Proposed.**—The organization of an American Institute of Biology is now being developed through the executive committees of the Union of American Biological Societies and the American Biological Society in cooperation with other groups An initiating committee has been formed and authorized to expand with a view toward complete geographic distribution and adequate representation of the principal societies of biology A statement has been approved by the council of the Union of American Biological Societies, comprising thirty-nine national societies, to endorse the formation of the organization of biologists on the basis of the two following general propositions

To provide a means for executing our public responsibilities as biologists and scientists so that the freedom essential to the progress of science and public welfare will be insured

*To safeguard* the professional interests of biologists and to assist in providing the material means for the promotion of biological research also to provide such services as may be necessary to facilitate this program

According to *Science*, a main feature is the importance of closely relating the proposed institute with the National Research Council and having the institute serve to strengthen and supplement the activities of the council

**Pan American Medical Women's Alliance**—The Pan American Medical Women's Alliance was incorporated at Columbus, Ohio, April 18, to set up an organization for the interchange of ideas among physicians in the Western Hemisphere. According to press reports the plan was fostered in Cincinnati to bring about an interchange of all possible medical ideas among women who are practicing physicians in the United States and South American countries Trustees of the new group include Drs Helen I Glueck, Cincinnati, Elizabeth Mason-Hohl, Los Angeles, Esperanza Oteo de Hoogh, Mexico City, Rita V S Finkler, Newark, N J, Alma Dea Morani, Philadelphia Victoire D Lespinasse, Chicago, and Margaret M Nicholson, Washington, D C. It is hoped to hold a meeting in Mexico City in about six months

**Fellowships Available for Study of Rheumatic Fever**—The American Council on Rheumatic Fever of the American Heart Association announces that it will entertain applications for American Legion fellowships for the study of rheumatic fever Applications will be accepted from recognized institutions concerned with the study of rheumatic fever and rheumatic heart disease Two fellowships are available. Each is for a period of three years and carries a stipend of $3 500, $4,000 and $5,000 for the first, second and third years respectively Each application should supply information concerning the institution, the projected study and the person proposed for the fellowship Applications will be received until August 1 and become effective September 1 The American Legion fellowships for the study of rheumatic fever have been made available by a grant from the American Legion and the Women's Auxiliary of the American Legion as part of their program of fostering research in rheumatic fever and rheumatic heart disease through the American Council on Rheumatic Fever of the American Heart Association (THE JOURNAL, June 15, p 620)

## CANADA

**Cancer Society Changes Name.**—The Canada Society for the Control of Cancer recently voted to change its name to the Canadian Cancer Society Mr J G Stephenson, London, Ont, was elected president to succeed Dr John S McEachern, Calgary, Alta., first president, who resigned in 1944 because of ill health. Mr Stephenson is the assistant general manager and director of agencies for the London Life Insurance Company

**Personal**—Major Gen Charles P Fenwick, Toronto Ont., who was director general of medical services for the Canadian army in World War II, has been named chief of medical services for the Canadian Pacific Railway, with headquarters in Montreal He succeeds Dr Henry A Beatty, Toronto who has retired after forty-four years of service, thirty of them in charge of the medical department.

**Canadian Medical Association.**—The 1946 session of the Canadian Medical Association was held in Banff Springs Hotel, June 10-14, under the presidency of Dr Leon Gérin-Lajoie, Montreal Included among the many speakers on the program were

Dr Leonard G Parsons, Birmingham, England The Blackader Oration
Dr Arthur W Proetz St Louis Reliability of Radiologic Evidence of Sinus Disease.
Dr Rubin Flocks, Iowa City Carcinoma of the Bladder
Dr Alan A Moncrieff London England, subject not announced
Dr Donald Patterson London England, subject not announced.

**Osler Medal to Student.**—The American Association of the History of Medicine at its annual meeting held in Atlantic City, May 27, awarded the William Osler Medal to Mr Peter Kellaway of McGill University Faculty of Medicine, Montreal, for his essay "The Part Played by Electric Fish in the Early History of Bioelectricity and Electrotherapy" The William Osler Medal was established by the association in order to stimulate interest and research in medical history among students of the medical schools of the United States and Canada and is granted annually to the author of the best student essay submitted to the association

## CORRECTION

**Academy of Sciences**—Karl P Link, Ph D is professor of biochemistry in the College of Agriculture in the University of Wisconsin and not in the medical school, as was reported in THE JOURNAL, June 1, page 473

# Deaths

**John Prescott Grant** ⊕ Coral Gables Fla , McGill University Faculty of Medicine Montreal, Que, Canada, 1895, born in New Glasgow, N S, Canada Oct 31, 1872 fellow of the American College of Surgeons, New York Academy of Medicine and the National Society for the Advancement of Gastroenterology member of the Royal College of Surgeons and the New York Gastroenterology Society, chief of the surgical clinic from 1907 to 1912 at Cornell University Medical College New York where he had been instructor in operative and clinical surgery from 1906 to 1912 adjunct professor of surgery from 1912 to 1914 clinical professor of surgery from 1914 to 1917 and professor of surgery from 1917 to 1938 at the New York Polyclinic Medical School and Hospital, where he had been president of the faculty from 1924 to 1926, director of the department of surgery for two years and later consulting surgeon and surgeon at the Polyclinic Hospital, consulting surgeon to the New York City, Midtown, Peoples and Bronx Maternity hospitals in New York, served as director of surgery at the Long Beach (N Y) Hospital, author of the surgical section in Dr Samuel Weiss's textbook "Diseases of the Stomach, Liver and Pancreas" in 1935 died in the Sun-Ray Park Health Resort in Miami, Fla , May 27, aged 73, of cerebral hemorrhage

**Warren Zimmerman Anders** ⊕ Collegeville, Pa , Medico-Chirurgical College of Philadelphia, 1898, served as president of the local board of education, died in the Montgomery Hospital Norristown, March 27, aged 70, of carcinoma of the bladder

**Charles James Burgess** ⊕ Lawrence, Mass , Tufts College Medical School, Boston, 1898, specialist certified by the American Board of Radiology Inc , member of the New England Roentgen Ray Society and the Radiological Society of North America, Inc., on the staff of the Lawrence General Hospital, died February 16, aged 76, of cerebral hemorrhage.

**Charles Smiley Cavett,** North Baltimore, Ohio, Starling Medical College Columbus, 1895, served as mayor of the village for two terms and as councilman for one term, lieutenant in the medical corps of the U S Army during World War I died February 16, aged 78

**Oliver Thaddeus Clark,** Keokuk, Iowa, Drake University College of Medicine Des Moines, 1909 member of the American Medical Association, on the staffs of St Joseph's Hospital and the Graham Protestant Hospital, where he died March 13 aged 63, of coronary thrombosis

**Henry Magruder De Jarnette,** Fredericksburg, Va University College of Medicine, Richmond, 1897, member of the American Medical Association, died in February, aged 72, of coronary thrombosis

**Lorenzo Simeon Dewey** ⊕ Okanogan, Wash Northwestern University Medical School, Chicago, 1907, for many years city and county health officer, died February 28, aged 64, of coronary thrombosis

**William Thomas Dickerson,** Licking Mo Marion-Sims College of Medicine St. Louis, 1892 died February 8, aged 81, of carcinoma

**Edward Lewis Dodd,** Belleville N J Columbia University College of Physicians and Surgeons, New York, 1900, member of the American Medical Association for many years medical examiner for the Pennsylvania Railroad, died February 19 aged 73, of cerebral thrombosis

**Frantz Brandon Erwin,** Oklahoma City University Medical College of Kansas City Mo 1906, member of the American Medical Association, died February 28, aged 72, of cerebral hemorrhage.

**John L Fennell,** Waterloo, S C University of Georgia Medical Department Augusta, 1902, honorary member of the South Carolina Medical Association member of the American Medical Association served as secretary-treasurer of the Laurens County Medical Society died February 27, aged 68, of cerebral hemorrhage.

**William Francis Flanagan** ⊕ New Britain Conn Fordham University School of Medicine, New York, 1917 fellow of the American College of Surgeons on the staff of the New Britain General Hospital, died February 13, aged 54 of heart disease

**Mary Stamper Hornby Frost,** Brookline, Mass Boston University School of Medicine 1891 died in Worcester recently aged 92 of bronchopneumonia

**Grover Willis Gaines,** Richmond, Mo , University Medical College of Kansas City, 1911, member of the American Medical Association, formerly secretary of the Ray County Medical Society served during World War I, for many years county coroner, died in the Trinity Lutheran Hospital Kansas City, February 26 aged 60, of coronary thrombosis

**Harry Shirk Garrett** ⊕ Park Ridge, N J , University of Buffalo School of Medicine, 1914, member of the Medical Society of the State of New York, served as a lieutenant in the medical corps of the U S Army during World War I died April 1 aged 54, of coronary thrombosis

**Henry Oswald Grangaard** ⊕ Jamestown, N D University of Minnesota College of Medicine and Surgery, Minneapolis, 1908, member of the American Medical Association and the Minnesota State Medical Association affiliated with the North Dakota State Hospital for Insane, died February 10, aged 63, of coronary occlusion

**Joseph Henry Graves,** Houston, Texas, University of Texas School of Medicine Galveston, 1912, member of the American Medical Association served during the Spanish-American War and World War I, formerly member of the county school board, died in the Veterans Administration Facility, Dallas, February 22, aged 71, of brain tumor

**Anna Morgan Handshaw,** Chicago, Northwestern University Woman's Medical School, Chicago, 1893 member of the American Medical Association, died in the Garfield Park Hospital February 20, aged 88, of chronic myocarditis

**Benjamin Harmon Hawkins** ⊕ Mena, Ark , University of Arkansas School of Medicine, Little Rock, 1904, served during World War I formerly owner of the Mena Hospital, died January 13, aged 67

**Charles Arthur Hayes,** Glendale, Calif , University of Southern California School of Medicine, Los Angeles 1900, fellow of the American College of Surgeons, formerly a medical missionary in China, died in the Good Samaritan Hospital, Los Angeles, February 25 aged 73 of cerebral hemorrhage

**Ralph Philip Higgins,** Ansley, Neb University of Nebraska College of Medicine, Omaha, 1912 served during World War I, died February 22, aged 57, of coronary thrombosis

**John Dixon Jackson,** Connellsville Pa (licensed in Pennsylvania in 1883), died recently, aged 93, of arteriosclerosis

**Charles F Kirkpatrick,** Ashland Neb Columbus Medical College, 1882, member of the American Medical Association, formerly affiliated with the local school board, died February 25 aged 88 of coronary thrombosis

**Milton Korb,** Providence, R I , Columbia University College of Physicians and Surgeons New York, 1939 served a residency at the Boston City Hospital and an internship at St. Joseph's Hospital commissioned a lieutenant in the medical corps, Army of the United States, on April 2, 1942, promoted to captain, relieved from active duty , died Dec 29 1945, aged 35, of coronary thrombosis

**Harry Michael Kraemer** ⊕ Scranton Pa , University of Pennsylvania School of Medicine, Philadelphia, 1914, served overseas during World War I, for many years affiliated with the State Hospital died February 16 aged 54 of chronic myocarditis

**James Stevens Macdonald,** Brookline Mass , McGill University Faculty of Medicine Montreal, Que., Canada, 1899, died February 26 of cerebral arteriosclerosis

**John A McCollum** ⊕ Vonore Tenn., Chattanooga Medical College, 1894, died February 20, aged 78 of heart disease

**Oscar Tracy McDonough,** Washington, Pa, College of Physicians and Surgeons Baltimore, 1904, member of the American Medical Association, died recently, aged 75 of generalized arteriosclerosis

**Thomas Chester McCord,** Paris Ill Medical College of Ohio, Cincinnati, 1883 formerly mayor, served during the Spanish-American War for many years member of the city council died in the Paris Hospital February 13 aged 89

**Melvin Saunders McLeod,** Melrose, Mass University of Vermont College of Medicine Burlington, 1920 member of the American Medical Association, served during World War I, on the staff of the Melrose Hospital, associate member of the Malden (Mass) Hospital staff died in Somerville February 26 aged 49 of coronary thrombosis

**John T Moss** ⊕ Memphis Tenn ; Jefferson Medical College of Philadelphia, 1908, died March 12, aged 66, of mitral regurgitation.

**Winfield Scott Nickerson,** Faribault Minn , University of Minnesota College of Medicine and Surgery, Minneapolis, 1905, served during World War I on the staff of the St Lucas Evangelical Deaconess Hospital, died in Bedford, Mass recently, aged 81, of arteriosclerotic heart disease

**Charles Ilsley Porter,** Sharon, Mass Boston University School of Medicine 1888 for many years a member of the board of health in Canton a member of the staff of the Norwood (Mass ) Hospital died February 18 aged 81 of coronary thrombosis

**Clarence Marion Porter,** Woodward Iowa Drake University Medical Department Des Moines 1901 member of the American Medical Association on the staff of the Hospital for Epileptics and School for Feebleminded died in the Mercy Hospital Des Moines February 16 aged 70 of carcinoma of the bladder

**John D Quarles,** Whitleyville Tenn , University of Nashville Medical Department, 1896 member of the American Medical Association died January 29 aged 73

**John Henry Reb** ⊕ Brooklyn College of Physicians and Surgeons medical department of Columbia College, New York, 1894 on the staff of the Samaritan Hospital, member of the board of visitors of the Kings Park (N Y ) State Hospital where he had been president died February 10 aged 72 of carcinoma of the urinary bladder

**Daniel Waldo ReMine,** Amarillo Texas, University of Tennessee College of Medicine, Memphis, 1932 member of the American Medical Association and the New Mexico Medical Society, died February 12 aged 38 of tuberculosis

**Eldred Andre Roberts,** Baltimore University of Maryland School of Medicine and College of Physicians and Surgeons Baltimore 1929 member of the American Medical Association died recently aged 49

**William J Saling** ⊕ Decatur, Ill University of Louisville (Ky ) Medical Department 1892 known for his invention of a metal splint designed to prevent 'flat wrist" following forearm or wrist breaks died May 9 aged 80 of myocarditis

**Owen Rogers Stafford** Los Angeles University of Southern California School of Medicine Los Angeles 1901, specialist certified by the American Board of Radiology, Inc. at one time professor of roentgenology at the College of Medical Evangelists served as county health officer, died February 16 aged 69 of arterial thrombosis

**James T Stone,** Oneonta Ala Memphis (Tenn ) Hospital Medical College 1891 member of the American Medical Association died February 5 aged 80 of myocardial degeneration and senility

**William Ross Strickland** ⊕ Rockport Mo Marion Sims College of Medicine, St Louis 1898 an Affiliate Fellow of the American Medical Association served as postmaster and mayor, died February 9 aged 76, of cerebral hemorrhage.

**Cleve L Sullivan,** Elmore City Okla Barnes Medical College, St Louis 1905 member of the American Medical Association, helped organize the First State Bank of Elmore City, of which he had been director and vice president died January 25 aged 65

**Mark Sutphin** ⊕ Huntington W Va Bennett Medical College Chicago, 1914 served in the medical corps of the American Expeditionary Forces during World War I formerly a medical consultant for the Veterans Administration in Logan died May 7 aged 59

**Abraham Otto Tumen** ⊕ New York University and Bellevue Hospital Medical College New York 1926, on the staffs of the Harlem Manhattan General and Mount Sinai hospitals, died February 14 aged 42 of coronary thrombosis

**Lucas Grove Tuttle,** Springfield Mo , Albany (N Y ) Medical College 1893, died February 16, aged 88 of heart disease

**Walter Harold Vance,** Fort Wayne Ind Indiana University School of Medicine Indianapolis 1925 member of the American Medical Association served as a captain in the medical corps Army of the United States during World War II, died February 9 aged 46 of coronary occlusion

**Fred Chandler Vilas,** Kelso Wash University of Vermont College of Medicine Burlington 1882 formerly postmaster of Stambaugh died in St John's Hospital Longview, January 18 aged 86, of prostatic obstruction of the bladder

**Charles L Waddle,** Somerset Ky Hospital College of Medicine Louisville 1903, member of the American Medical Association died in February aged 65 of hypertensive heart disease

**Ezra Heber Walker,** Moab Utah, Memphis (Tenn.) Hospital Medical College, 1911, for many years physician and surgeon for the Chesterfield Coal Company, died in a hospital at Provo May 16, aged 63, of parkinsonism

**Patrick McHugh Walker,** Los Angeles, McGill University Faculty of Medicine, Montreal, Que, Canada, 1898, member of the American Medical Association, formerly chief division surgeon for the Great Northern Railway, died in the Good Samaritan Hospital February 25, aged 69

**Mae Louise D Washburn,** Wellsboro, Pa Southern Homeopathic Medical College, Baltimore, 1904 died January 4, aged 78, of carcinoma of the breast.

**John Thomas Watkins,** Nashville, Tenn , Vanderbilt University School of Medicine Nashville, 1912, first director of the venereal disease clinic of the city health department, for many years member of the staff of the Protestant Hospital, died February 27, aged 57, of pulmonary tuberculosis

**John Samuel Wells Jr,** Clearwater, Fla , Rush Medical College Chicago, 1931, found dead February 12 in Seco, Ky aged 40

**E Reed Whittemore** ⊕ New Haven, Conn , Columbia University College of Physicians and Surgeons New York, 1902, fellow of the American College of Surgeons on the staff of the New Haven Hospital, died recently, aged 68.

**Louis Willard,** Pittsburgh Hahnemann Medical College and Hospital of Philadelphia, 1906 member of the American Medical Association, died January 27, aged 64, of heart disease

**John Wilson,** Bloomfield Mo , Washington University School of Medicine, St Louis 1911, served in France during World War I, died in St Francis Hospital Cape Girardeau, January 24, aged 60

**Russell Wilson Wolfe,** Taylorstown, Pa Western Pennsylvania Medical College, Pittsburgh, 1889, died recently aged 85, of bronchopneumonia and carcinoma of the colon

**William Yarm,** Brooklyn, Cornell University Medical College New York 1909, at one time on the New York State Board of Health, attending physician at the Kingston Avenue Hospital and a member of the heart clinic of the Cumberland Street Hospital, died April 2 aged 59, of coronary thrombosis

## DIED WHILE IN MILITARY SERVICE

**Richard Williams Cragg** ⊕ Vallejo, Calif , University of Cincinnati College of Medicine, 1931, born in Cincinnati Dec. 14, 1905, member of the American Society of Clinical Pathologists, interned at the Cincinnati General Hospital physician at the Cincinnati Workhouse from October 1931 to October 1932, when he joined the Mayo Foundation Rochester, Minn., as a fellow in pathology, later appointed first assistant in pathologic anatomy and surgical pathology, consulting physician in pathologic anatomy at the Mayo Clinic instructor in pathology at the foundation and assistant professor of pathology received the degree of master of science from the University of Minnesota in 1936, began active duty as a first lieutenant in the medical corps of the U S Naval Reserve on July 1, 1942, pathologist at the Naval Hospital at Corona Calif assigned to duty at the Naval Advance Base Training Section at San Bruno, Calif , went to Mare Island where he was chief pathologist at the Naval Hospital promoted to lieutenant commander, died February 18 aged 40 of coronary occlusion

**Joseph George Sandler,** Ellenville, N Y , Yale University School of Medicine New Haven Conn, 1931 member of the American Medical Association, interned at the Jewish Hospital in Brooklyn served as health officer of the town of Wawarsing began active duty as a lieutenant in the medical corps, U S Naval Reserve, on April 5 1943 served over seas in the invasions of Sicily and Africa and on the island of Eniwetok in the Pacific, died in the Hamilton Avenue Hospital, Monticello, Nov 16 1945 aged 38 of coronary thrombosis

**Ignatius Zielinski** ⊕ Salem, Mass Tufts College Medical School, Boston 1924 interned at the Salem Hospital in Salem for many years medical examiner of the Tenth Essex district commissioned a lieutenant commander in the medical corps of the U S Naval Reserve on Nov 21 1942 served at the dispensary of the Boston Navy Yard and later saw duty in Hawaii assigned as chief surgeon to Quonset subsequently died in Fishkill N Y Nov 11, 1945, aged 45, of injuries received in an airplane crash

### Official Investigation of Doctors' Incomes

With reference to the national health service the minister of health appointed a committee, of which nearly half were doctors, to consider what should be the range of total income of a registered medical practitioner in any publicly organized service of general medical practice, with due regard to what have been the normal financial expectations of general practice in the past, and to the desirability of maintaining in the future the proper social and economic status of general medical practice and its power to attract a suitable type of recruit to the profession. The report of the committee, which has just been published, proposes an increased expenditure on general practice 'less on any particular consideration than on the importance of such practice in a publicly organized health service." The report states that general practice is the foundation on which all else is built If its recruitment is not maintained, alike in quantity and in quality, both as against other professions and as against other branches of the medical profession, no other health service specialist or hospital however excellent, can make good the loss or even play successfully the part it should

The main recommendation of the committee in respect to a publicly organized service is that the scheme should be devised to secure as far as practicable that between 40 and 50 years of age approximately three fourths of practitioners should receive incomes of more than $5,000, one half of whom should receive $6,500 or over, approximately one fourth should receive $8,000 slightly less than one tenth should receive more than $10,000 and a small proportion should receive at least $12,500 All incomes are given as net, that is after deduction of professional expenses The recommendations are made in terms of the 1939 value of money, which was distinctly greater than the value at present.

*Incomes of General Practitioners After Deducting Professional Expenses Allowed for Income Tax Purposes*

| | Proposed Distribution Per Cent | Distribution Before 1939 Per Cent |
|---|---|---|
| Under $3,500 | 7 | 20 |
| $3 500 to 5 000 | 20 | 22 5 |
| $5 000 to 6,500 | 24 | 21 |
| $6 500 to 8 000 | 24 | 17 5 |
| $8 000 to 10 000 | 16 | 10 |
| Over $10 000 | 9 | 9 |

A table is given in the report of incomes of general practitioners in urban areas in the prewar years 1936-1938 after deducting professional expenses and covering ages 30 to 64 It shows that throughout the best years of a practitioner's working life almost 20 per cent of urban practitioners had a net income of less than $3 500 a year and over 40 per cent less than $5,000 Having regard to the length of training to the arduousness of the general practitioner's life compared with that of other professions to the greater danger to health, to the skill and other qualities required, and to the degree of individual responsibility, the committee unanimously held that the proportion of low incomes was too high and that the proportion of practitioners able to reach a net income of $6,500 or over was too low The committee considered it desirable to secure a percentage spread of incomes not less favorable than that shown in the accompanying table, which refers to the age group 40-49

The committee points out that the effect of its proposals will be that between the ages of 40 and 50 three fourths of general practitioners would have achieved a net income of over $5,000 per annum, half over $6,500, a fourth over $8,000 and slightly less than one tenth $10,000 or over The committee is satisfied that there exists a far greater diversity of ability and effort among general practitioners than admits of remuneration by some single scale applicable to all It anticipates that a publicly organized service will level up low incomes to a considerable extent. Any augmentation required might be provided, for example if sufficient refresher courses could be provided by paying a bonus of, say, $500 a year to a practitioner who had attended such a course within the preceding three years or by grant toward professional expenses when they represent an abnormally high percentage of gross receipts On the assumption that the number of persons covered by a publicly organized service will be 45 million, the committee calculates that its proposals could be realized at a cost of $3 a head This is a considerable increase both on the capitation payments under the existing national health insurance scheme and on the total income of practitioners in the three years that ended in 1939 A rider to the report by one member of the committee, Sir Edward Fass, proposes a lower rate of remuneration than that mentioned on the ground that the earnings of a physician must be kept in proportion to those of comparable professions

### "Haptoglobin' and Its Clinical Significance

In a quantitative study of the peroxydasic power of hemoglobin, by the determination of iodine liberated in a mixture of hydroiodic acid and ethylhydroperoxide, M Polonovsky and M Jayle noted that the reaction increases when small quantities of blood plasma are added. The fraction of the plasma responsible for this reaction is a blood protein named 'haptoglobin" by them

Haptoglobin is increased in all infections tuberculosis, rheumatism malignant tumors and certain endocrine-disorders It is more responsive and more precise than the blood sedimentation test. The index of haptoglobinemia may be zero or low in newborn children or in hemolytic diseases

### Neuroedematous Syndrome

R. Debre, J Marie, P Seringe and Mande describe a new disease of epidemic aspect with alteration of the general state fever, tachycardia, edema, diffuse pain and peripheral paralysis Recovery may occur within a few weeks, or death ensue through bulbar paralysis

### Testosterone for Endometriomas

P Moulonguet has obtained a cure of endometrioma by 250 mg of testosterone per month. This method is a substitute for castration, which has been the only efficacious treatment up to now

### Intravenous Procaine Hydrochloride

M P Ameuille has discussed the successful use in France of intravenous injections of 1 per cent procaine hydrochloride for asthmatic crises, pulmonary emboli, angina pectoris and chronic dyspnea

## MORTALITY IN PREGNANCIES COMPLICATED BY DIABETES

*To the Editor* —In an article in THE JOURNAL Jan 29, 1944 entitled Fetal and Neonatal Mortality in Pregnancies Complicated by Diabetes Mellitus, Miller, Hurwitz and Kuder presented evidence showing that the fetal and neonatal mortality was 20 per cent in a group of 252 infants born twenty years or less before the appearance of signs or symptoms of diabetes in their mothers Drs Henry Dolger and Joseph Herzstein in a communication in THE JOURNAL July 29, 1944 presented evidence which they thought failed to substantiate the results published by Miller, Hurwitz and Kuder Drs Dolger and Herzstein have elaborated on this evidence in a recent publication entitled The Fetal Mortality in Women During the Prediabetic Period, which appears in the *American Journal of Obstetrics and Gynecology* of March 1946

*In their recent publication those authors state that 'the first* five year prediabetic period revealed an increased fetal and neonatal mortality, but the preceding fifteen years was *not* [italics theirs] characterized by such a tendency" Their data show, however, a mortality of 7 5 per cent among 212 infants born during the fifteen years prior to the onset of maternal diabetes The mortality in the nondiabetic group of 398 infants was 3 01 per cent Assuming that the diabetic and nondiabetic groups studied by Dolger and Herzstein are comparable in all respects except in regard to diabetes, the difference between the mortality rate of 7 5 per cent for the prediabetic pregnancies is significantly higher than that of 3 01 per cent for the nondiabetic group The chi square test applied to these two mortality rates shows a value of 6 5, indicating that the difference between the two groups is well within the range that is usually considered to be statistically significant Furthermore, it is difficult to understand why Dolger and Herzstein attach no significance to the fact that the gross fetal and neonatal mortality rate for all their 626 prediabetic pregnancies was 6 01 per cent when actually it is possible to demonstrate that this rate is also statistically significantly higher than that for the nondiabetic group The chi square test applied to these two groups shows a value of 4 9

The data presented by Dolger and Herzstein support not only the earlier findings of Miller, Hurwitz and Kuder but also the more recent studies of mine (The Effect of the Prediabetic State on the Survival of the Fetus and the Birth Weight of the Newborn Infant) reported in the *New England Journal of Medicine* **233** 376 (Sept 27) 1945 The last mentioned study shows that the fetal and neonatal mortality rate is higher than is to be expected during the period of fifteen years preceding the onset of diabetes even though the diabetic syndrome is not established until after the mothers have passed their fortieth birthday

The conclusions reached by Dolger and Herzstein are of doubtful significance, since they have failed to make clear whether or not the data on their control group of cases were obtained in the same manner as those in the experimental group Fetal and neonatal mortality rates obtained by personally interviewing women several years after the births of their infants are not to be compared, for instance, to similar rates based on hospital deliveries in which every infant weighing over 1 000 Gm at birth is recorded and counted Furthermore, in their recent publication Dolger and Herzstein do not define either the term 'fetal" or "neonatal' death thus making it difficult to compare their data with those reported by other investigators

HERBERT C MILLER, M D, Kansas City, Kan

## THE RADIATION TREATMENT OF GIANT FOLLICULAR LYMPHADENOPATHY

*To the Editor* —Dr Ovid O Meyer, in a communication published in THE JOURNAL April 13, questions the validity of your editorial expression that giant follicular lymphadenopathy "is curable by mild x-ray therapy," stating with rather broad inclusiveness, it seems to me, that "this is incorrect in the opinion of most students of the disease." However this may be, the fact remains that in the comparatively short interval of twenty one years during which radiation has been employed in the treatment of giant follicular lymphadenopathy I myself have encountered 5 histologically proved cases in which this form of therapy was followed by apparent cures for periods of 3, 4½, 5, 9½ and 12 years Another patient with histologically proved giant follicular lymphadenopathy survived 9 years without treatment of any sort directed against the enlarged lymph nodes, the final microscopic examination having been made 10 days before death from lobar pneumonia

In giant follicular lymphadenopathy the quick response of the lymph nodes to mild roentgen therapy is so impressive that if recurrence is noted and readjustment of the enlarged nodes is delayed or incomplete or both, and larger doses are required, one would seem to be justified in suspecting that the condition has undergone some form of mutation such as transformation into polymorphous cell follicular sarcoma or into Hodgkin's disease, both of which have been described and both of which are radioresistant It is entirely possible that some, perhaps many, of those cases which have been regarded as recalcitrant examples of giant follicular lymphadenopathy were in reality mutations of the sort indicated and therefore less amenable to radiation therapy In other words, before one condemns the radiation treatment of giant follicular lymphadenopathy one should be certain that the diagnosis is correct

DOUGLAS SYMMERS, M D, New York

# Bureau of Investigation

## SOME MISCELLANEOUS MEDICAL FRAUDS

### A Variety of Schemes Debarred from the Mails

Fraud orders issued by the Post Office Department have frequently been the subject of extensive articles by the Bureau of Investigation in these pages of THE JOURNAL. One such order is abstracted here

**Phurcerol Company** —This Chicago concern is reported to have had one Charles L. Cremieux as president and superintendent and an Irene Drew as vice-president and general manager Through the mails it sold Phurcerol as an external remedy for 'arthritis rheumatism muscular aches and pains' which nostrum was described on the company's letterhead as The Wonder Sulphur For Arthritis' According to federal investigators the business was started about July 1941 and reached its clientele through newspaper advertising in small cities and towns. Those who replied received a form letter and a descriptive pamphlet. The former claimed that the product had been 'carefully tried out on a large number of stubborn cases and 'the results have been truly amazing" It went on to claim that all those who were given treatment were aware of improvement and in some cases where the patients had been bed ridden they found themselves able to walk again ' There was the further claim Phurcerol has been approved by the U S Food & Drug Administration I Finally the concern was ordered by the Post Office Department to show cause why it should not be debarred from the mails on the ground that it conducted a fraud At the hearing a government chemist testified that his analysis of a specimen of Phurcerol obtained through test correspondence showed it to be a yellowish red liquid consisting of a hydroalcoholic solution of about 1 per cent isopropyl alcohol and glycerin with 11 grams of potassium sulfide in the four-ounce bottle, and some flavoring Another government witness, a Senior Medical Officer for the Food and Drug Administration, testified that in the treatment of arthritis, complete diagnostic measures should be taken to determine the type of the disease and any existing complications He showed that there is no one course of treatment for all the various types of arthritis and their complications and hence each sufferer requires

individualized therapy He further showed that the potassium sulfide in the mixture was the only drug present in sufficient strength to have any effect worth considering and that the sulfur or sulfides present could not be absorbed into the skin to any appreciable extent and even if they were they would be of no value to the system His final testimony was that he could find no evidence in the files of the Food and Drug Administration that that agency had approved Phurcerol and that on the contrary it had notified the defendants by letter "that this preparation should not be considered as a good remedy or an effective treatment for arthritis and rheumatism and that labeling it as such would be considered by the officials to be misbranding under the Food Drug and Cosmetics Act No defense was offered by the respondents who neither appeared at the hearing nor were represented by counsel though the latter did declare in a letter to the Post Office Department that his clients had made no extensive progress in marketing Phurcerol and hence had discontinued the advertising and sale of it through the mails Since the charges were found to be sustained by the evidence a fraud order was recommended and this was issued on June 8 1944 against the Phurcerol Company Irene Drew C Cremieux and their officers and agents

## NEW NAMES FOR OLD SWINDLES

### Mail-Order Defrauders Are Also Repeaters

Fraud orders issued by the United States Post Office are really effective—so far as the trade styles and names used at the time of the order are concerned Circumvention therefore requires the use of new trade styles and names—but this fortunately results in the issuance of supplemental orders by the Post Office Department as indicated in the following abstract

**Hall Dean Home Health Association or Health Service**—This outfit at Boulder Colo, appears to have been an outgrowth of the Fisheropathic College Association of Denver, which was debarred from the mails by a Post Office fraud order in 1933, as reported in a lengthy article in this department of The Journal October 28 that year The original outfit was run by a George B Fisher, his sister and his son Denver newspapers reported in 1911 that George B Fisher had been found guilty in the federal courts of sending obscene matter through the mails to the "wives of two prominent Denver business men and that the judge before whom Fisher was tried gave him a scathing arraignment, stating that a man who was guilty of the practices of which Fisher had been convicted was of the lowest species of humanity and not fit to mingle with decent and respectable people. The papers further reported that at some prior time Fisher had been charged with defrauding an aged and infirm woman out of $15 000 in notes and securities and forced by a court to restore them. In 1923 two of Fisher's nostrums, "Uterine Tonic and Kidney Food ' were found to be misbranded under the National Food and Drugs Act the former because it was fraudulently represented as an effective cure for lack of passion cancer of the uterus gonorrhea and some other things. His nostrums included several others among them After Dinner Gems and Uterine Tonic Knowledge which also figure in the present case Early in 1944 the Post Office Department obtained evidence that a Boulder Colo. outfit operating as Hall Dean Home Health Association Hall Dean Health Service or just plain Hall Dean was promoting through the mails a so-called system of treatment called synonymously Deanopathy and Fisheropathy with one George H Hall as chief promoter and apparently had revived the old business of the Fisheropathic College Association which enterprise the Post Office had declared a fraud as mentioned above The new concern was representing its After Dinner Gems as a highly effective remedy for appendicitis hay fever asthma, catarrh, bronchitis whooping cough, ptomaine poisoning and many other' diseases and ailments such as all stomach troubles including cancer Further it was claiming that Fisher's Uterine Tonic Knowledge was a highly effective remedy for even the most aggravated cases of female disorders that it would remove foreign growths and would eliminate the necessity for operations in such conditions. The so-called system of Deanopathy or 'Fisheropathy was represented as a highly effective preventive restorative and treatment for persons afflicted with paralysis pneumonia wasting of arterial muscular or nerve energy lost sexual power, weakened spine fallen arches baldness, dropsy consumption cancers and other disorders too numerous to mention When Hall was directed to appear at a hearing and show cause why a fraud order should not be issued against his business a government chemist testified that the Gems consisted of brown coated tablets containing sodium chloride talc, plant material (apparently senna and charcoal) phosphorus pentoxide and traces of capsicum oil of peppermint potassium calcium and nitrates The Uterine Tonic Knowledge he testified consisted of a small bottle of brown liquid and a number of empty capsules in which the medicine was to be taken and the mixture contained over 68 per cent of water, with smaller amounts of glycerin ammonium carbonate iodine a trace of potassium and some coloring matter A physician testifying as an expert medical witness for the government discussed the ailments for which these nostrums were promoted showing that the mixtures would be of little if any value in the conditions cited. Neither George H Hall nor his counsel attended the hearing though they did send communications to the Post Office Department declaring that their claims were fully warranted. Since their contentions were without weight and did not in any sense controvert the testimony presented against the outfit at the hearing a fraud order was issued Sept. 15 1944 debarring Hall Dean Hall Dean Health Service and Hall Dean Home Health Association from further use of the mails

# Bureau of Legal Medicine and Legislation

## MEDICOLEGAL ABSTRACTS

**Collection Agencies Corporation to Collect Hospital Bills—Illegal Practice of Law**—The plaintiff, Hospital Credit Exchange, Inc., sued to recover the balance of a bill for hospital services rendered to the defendant's wife The case was heard on plaintiff's motion for summary judgment and defendant's motion for a dismissal of the complaint in the municipal court of the city of New York, borough of Manhattan, first district.

The plaintiff, Hospital Credit Exchange, Inc. was incorporated under the Membership Corporations Law and its certificate of incorporation was approved by a justice of the New York Supreme Court in March 1939 As stated by its certificate of incorporation its purposes were among others, "To render services to member hospitals in connection with obtaining payment for care received by patients therein" Pursuant to such general purposes it appeared that the plaintiff had made arrangements with a large number of charitable hospitals in the city and vicinity of New York under which these hospitals refer to plaintiff for collection bills which they themselves have been unable to collect, these claims are generally, although not always, assigned to plaintiff by written instruments of assignment, plaintiff in its own name sends collection letters to the debtors requesting payment and stating that if the bill remains unpaid it will be turned over to an attorney for collection, if no results are obtained collection letters are then sent by an attorney who is employed by the plaintiff on a regular salaried basis, ultimately suit is instituted by the plaintiff in its own name, usually before suit is begun the plaintiff, which also employs a staff of so called field workers, attempts to collect the debt by sending one of these workers to call personally on the debtor The present case came to the plaintiff in accordance with this procedure and this suit was instituted by the salaried attorney for the plaintiff and in the name of the plaintiff as assignee of a charitable hospital

It was the defendant's primary contention that the plaintiff in operating as described was engaged in the practice of law contrary to public policy and in violation of the penal law The court said that the plaintiff was conducting the business of an ordinary collection agency, that it solicited claims and took assignments of such claims for the purpose of bringing suit, and that after effecting collection by suit or otherwise it retained for itself a percentage of the amount collected out of which it paid its office expenses and its salaried employees, including the attorney Section 280 of the penal law expressly forbids any corporation from practicing "as an attorney-at-law" and further provides 'No corporation shall solicit any claim or demand, or take an assignment thereof for the purpose of representing any person in the pursuit of any civil remedy, ' Section 275 of the penal law provides, in part No person or co partnership, engaged directly or indirectly in the business of collection and adjustment of claims, shall take an assignment of, or be in any manner interested in buying or taking an assignment of a book debt or other thing in action, or any claim or demand, with the intent or for the purpose of bringing an action or proceeding thereon "

The plaintiff contended that it is exempted from these provisions by virtue of a 1941 amendment to section 275 of the penal law which provides 'Nothing herein contained shall affect any assignment heretofore or hereafter taken by any corporation organized for religious, benevolent or charitable purposes The plaintiff argued that it was a charitable corporation. In my opinion, said the court, the plaintiff is not a charitable corporation. It is true that its only clients or customers are charitable hospitals However, the fact that for a fee it serves only charitable institutions does not make it a charitable corporation. The further fact that, after paying salaries to employees and commissions on collections to the aforementioned field workers, it distributes its profits to the charitable institutions which it serves, does not make it a chari-

table corporation. Furthermore, said the court, this amendment was not intended to authorize charitable corporations to practice law If the legislature had intended to confer on charitable corporations the right to practice law it would have so provided in explicit terms It is not to be inferred from anything contained in the act as amended that so radical a change in public policy was intended to be effected.

The plaintiff also insisted that it was exempted by the provisions of section 280 of the penal law which provides that such section shall not 'apply to organizations organized for benevolent or charitable purposes, or for the purpose of assisting persons without means in the pursuit of any civil remedy, whose existence, organization or incorporation may be approved by the appellate division of the supreme court of the department in which the principal office of such corporation or voluntary association may be located." I read that section, said the court, as meaning that any organization 'organized for benevolent or charitable purposes' which desires to be excepted from the operation of section 280 must be approved by the appellate division of the Supreme Court of the department in which its principal office is located Plaintiff would read the requirement for such approval as applicable only to organizations having "the purpose of assisting persons without means in the pursuit of any civil remedy" There is no good reason, the court concluded, for distinguishing between the two types of organizations so that one requires approval and the other does not

In conclusion the court said that, although the motives of the people who organized the plaintiff are commendable, and although the many persons who have come to its aid merit the respect of this court, the plaintiff must nevertheless yield to the public policy which interdicts the practice of law by lay agencies That policy springs from a vital public necessity Balancing the conveniences, and weighing the respective public interests involved I am constrained to the conclusion that to tolerate the practice of law by this plaintiff—and the plaintiff is undoubtedly practicing law—is to set a most dangerous precedent and to sanction a clear, though well intentioned, violation of statutes which are as specific as they could have been made.

Accordingly the plaintiff's motion for summary judgment was denied and judgment was entered in favor of the defendant dismissing the complaint.—*Hospital Credit Exchange, Inc., v Shapiro 59 N Y S (2d) 812 (N Y, 1946)*

**Medical Practice Acts Use of "M D," Drugs and Hemovitameter by Naturopath.**—In a proceeding before the State Board of Medical Registration and Examination the defendant s license to practice naturopathy was revoked On defendant s appeal to the circuit court, the board s order was reversed, so the board appealed to the Supreme Court of Indiana

The defendant a licensed naturopath, advertised himself as "Successor to C R Perdue, M D, Dermatologist and Plastic Surgeon," and as "a physician of wide experience and well qualified to administer any form of treatment which may be needed" He also asserted that, among other degrees, he had a degree of 'Doctor of Medicine.' He prescribed pills, salves and other medicines and used a machine which he called a hemovitameter and about which he testified "The interior of a hemovitameter is just a lot of wires and different circuits to different contacts and connections There is at least one radio tube in it. There are a number of resistance coils ' This machine he said, worked much like a radio The operator would contact with a little fibroid plate under which there are two coils in which the magnetism is built up to the point at which it causes the fingers to stick lightly to that plate Then by measuring the amount he can turn another dial which tunes in to that same circuit a blocking condenser until that magnetism is completely blocked out By that means the dials are read as being the intensity of the disease of the patient s body for that particular setting The detection of magnetism with one s fingers, the defendant explained, is by means of a traction through the plate to the coils underneath, the plate must be rubbed lightly, and it takes a lot of practice to operate the machine efficiently After using this machine, the defendant told one patient on her first visit that she was not addicted to tobacco and that she had catarrh and a cancer of the colon An engineer testified 'It is impossible to build any machine dealing in frequencies or vibrations that will pick up vibrations regardless of their source that does not fall within the known spectrum from zero to three hundred million cycles per second All those frequencies can be detected and measured with regular equipment. They cannot be detected by the human hand outside of those frequencies which cause burns, or light, or other physical manifestations observable to sight It is absolutely impossible for the human hand to detect magnetism in any form simply because basically and fundamentally magnetism has no effect except on a very few metals and minerals"

The Supreme Court said that misrepresenting himself as entitled to practice medicine, prescribing drugs and medicines not permitted by his license, and misrepresenting the powers of his machine to credulous and unsuspecting sufferers who put themselves in his hands on the assumption that, from his being permitted to practice, he was skilled in diagnosis and treatment of diseases, was, of course, grossly immoral The circuit court, on appeal, had only to determine whether or not the board conformed to the statutory procedural method and whether or not its decision was supported by substantial evidence From the undisputed evidence, the Supreme Court concluded that the board's decision was substantially supported Accordingly the judgment for the defendant was reversed and an order entered revoking the defendant's license.—*State Board of Medical Registration and Examination v Scherer, 46 N E (2d) 602 (Ind, 1943)*

**Streptomycin in Experimental Brucellosis**—Live and his co-workers found that 5 000 units of streptomycin daily given to guinea pigs in five doses had a bacteriostatic effect on Brucella abortus Four of 9 animals in which treatment was begun on the day of infection and was continued for twenty-seven days and 4 of 10 animals in which treatment was begun one week after infection and was continued for twenty days yielded negative cultures on necropsy one day after cessation of treatment Of the guinea pigs from which cultures were made eight days after discontinuation of therapy 3 animals from the group of 10 in which treatment was begun on the day of infection were still negative while all the guinea pigs in which treatment was begun one week after infection yielded Brucella abortus Treatment of guinea pigs with 20 000 units of streptomycin daily divided into six doses, seemed to eliminate the infection from most of the animals The treatment was begun one week after infection and was continued for twenty four days Necropsy of 17 animals one day after cessation of therapy revealed that 4 were positive on cultures necropsy of 10 animals eight days after cessation of treatment revealed that 2 were positive on cultures, and necropsy of 8 guinea pigs fifteen days after discontinuation of therapy revealed that only 1 animal yielded Brucella on cultures Following a single subcutaneous injection of streptomycin, the blood serum levels are highest soon after injection of the drug In guinea pigs injected with 1,000 units no detectable concentration of streptomycin was found in the blood serum after four hours, and in those injected with 5,000 units no detectable concentration of streptomycin was found in the blood serum after six hours

**Penicillin in Ulcerative Colitis**—Korostoff and King administered penicillin in doses of 30 000 units intramuscularly every three hours for four or five days up to a total of 1,200,000 units to 5 patients with ulcerative colitis The disappearance of rectal ulcerations in each case within one week after the completion of one course of penicillin was the prominent feature The subjective symptoms and the character of the stool improved in each instance. The results in these few cases indicate that adequate penicillin therapy may be of considerable value in the treatment or control of some cases of chronic ulcerative colitis

**"Wet Lung in War Casualties**—Experience gained in treating 770 chest casualties and thoracic complications that arose in over 3 000 other casualties demonstrated to Brewer and his associates the importance of wet lung Wet lung promotes anoxia and paves the way for pulmonary complications Abnormal amounts of mucoid secretions or blood from intrapulmonary hemorrhage may be present. Pulmonary trauma, increased respiratory effort, tracheal obstruction and anoxia are factors which favor the escape of fluid from the pulmonary capillaries into the alveoli and bronchial radicles Blast injuries of the lung are known to produce hemorrhage in the terminal divisions of the pulmonary tree and may be factors in the production of alveolar transudates In the late stages of shock blood plasma escapes into the tissue spaces One of the most important signs of wet lung is an almost constant wet cough"

Physical examination reveals dyspnea and bronchial rales. Every patient with a chest wound or a severe abdominal or brain injury must be regarded as a candidate for the development of wet lung. If the patient does not clear the bronchial tree by coughing, additional measures must be employed. The abolishment of painful and other stimuli arising in the chest wall and parietal pleura by nerve block may be all that is needed for clearing the pulmonary tree. Blocking of the intercostal nerves had made strapping of the thorax unnecessary. If the patient does not improve, or if there is evidence of inadequate raising of sputum, mechanical aspiration of the bronchial tree is resorted to. In bronchial obstruction recurring in spite of repeated tracheobronchial aspirations, bronchoscopy is preferred. The escape of plasma fluid into the alveoli and branches of the bronchial tree presents a problem demanding positive pressure oxygen therapy, but excessive pressures must be avoided.

**Insufflation of Sulfanilamide Powder in Pharyngeal Infections.**—Goldman and Kiesewetter present observations on the first 69 patients treated for acute tonsillitis, Vincent's ulcerative tonsillitis and acute pharyngitis by the local insufflation of sulfanilamide powder. Early in the series the powder was insufflated once a day. At present, whenever possible, the powder is administered twice a day. Fifty-four patients treated by other currently accepted methods served as controls. The average length of time required for clinical cure to be obtained was 1.8 days shorter for the patients with acute tonsillitis who were treated with sulfanilamide powder than for the control series, and 1.7 days shorter for the patients with Vincent's ulcerative tonsillitis who were similarly treated than for the control series. Sulfanilamide insufflations appeared effective for 9 patients with acute pharyngitis. The method of insufflation of sulfanilamide powder is simple and particularly suitable for use in the treatment of military personnel. The amount of the powder administered at each insufflation was about 5 grains (0.32 Gm.). In the cases of Vincent's ulcerative tonsillitis the powder remained in contact with the ulcer for as long as three hours after insufflation. The blood of 16 patients was examined for sulfanilamide, none had a detectable amount. Streptococcus hemolyticus (beta) was the principal microorganism in acute tonsillitis. It was isolated from the tonsils of 31 of the 64 patients with acute tonsillitis. Fusiform bacilli and Vincent's spirilla were demonstrated in smears of material from the throats of 49 of the 51 patients with ulcerative tonsillitis. Fifteen of 22 patients whose throats were studied bacteriologically were shown to harbor in addition pyogenic micro-organisms.

**Transdiaphragmatic Resection of Vagus Nerve for Peptic Ulcer.**—In their transthoracic transdiaphragmatic resection, which Moore and his associates have performed on 15 patients, sizable portions of both vagus nerves are resected and steps are taken to avoid regeneration. The procedure appears to be a potent weapon in dealing with peptic ulceration as judged by the clinical results in the early follow-up. The final evaluation of this method must await the passing of time and study of the patients in whom it has been employed. Patients who have had other surgery, such as pyloroplasty, posterior gastrojejunostomy or gastric resection, and who present themselves with renewed ulceration are ideal subjects for this procedure. The previous surgery does not complicate

the operation It may be carried out with excellent relief of symptoms in cases in which renewed attack on local structures through the abdomen would be technically complicated

Chronic Glomerulonephritis of Left Kidney Congenital Hypoplasia of Right Kidney —p 307

**Early Diagnosis of Phlebothrombosis**—Moses has observed that tenderness of the posterior calf following the course of the deep veins is almost always the first local sign of venous thrombosis The skin, subcutaneous tissue fascia and large calf muscles may be tested as a group aside from the deep veins by a simple test Firm pressure of the fingers is used to explore for tenderness in any area of the posterior calf When the level of tenderness has thus been determined the calf is firmly compressed from side to side and the degree of tenderness is compared with that elicited in the first part of the test In the presence of bland venous thrombi the skin, subcutaneous tissue fascia and muscles show little if any tenderness on firm compression, whereas direct pressure on the veins, as executed in the first maneuver, causes definite pain On the other hand, the superficial tissues are extremely tender at the second test if the tenderness resides in their layers These two stages do not, however, rule out tenderness of the deep calf nerves such as is present in a peripheral neuritis The third part of the test is therefore a neurologic examination

**Regional Injection of Penicillin in Local Infections**—The series of cases treated by Rose and Hurwitz comprised 2 cases of osteomyelitis of the finger, 6 of felon, 6 of carbuncle, 3 of perianal infections 6 of cellulitis, with and without abscess, and 2 of furuncle Penicillin dissolved in isotonic solution of sodium chloride was prepared in the usual manner, the amount of solution used depending on the type and size of lesion to be treated. In fingers and other areas where loose tissue precluded a large volume, 2 to 4 cc was used to dissolve 100,000 units of penicillin thus giving a concentration of 50 000 to 25 000 units per cubic centimeter The parts were cleansed with soap and water and painted with an aqueous solution or tincture of zephiran and zones of tenderness were mapped out. Two to four sites of injection were chosen The authors made the injection by hypodermic needle starting outside the zone of palpable tenderness injecting slowly ahead of the needle and progressing toward the center of the infection The injection was made deeply in the tissue, not merely subcutaneously, except when the infection was within the skin such as furuncles Disability is reduced far below the point reached by any other means of treatment There is no deformity such as that frequently following radical surgical incision and drainage Pain is quickly relieved in some cases within one hour and always within thirty-six hours Preferably no evacuation should be performed until complete localization and then only minimal surgery is indicated. In most cases evacuation occurs spontaneously during localization with freedom from pain Injections are painful, and the degree of pain is in direct ratio to the density of tissue and the volume of injection Injections once daily are adequate. The fear of spreading the infection by this treatment has not been substantiated. In part this is due to the fact that injections are started well outside the center of infection, thus reinforcing the barrier and aiding in localization.

**Treatment of Adenocarcinoma of Uterus**—Gray and his associates treated 10 women with adenocarcinoma of the uterus The cases are reported without a five year follow up because residual carcinoma was found in some who had received enormous doses of radium by means of the hysterostat designed by one of the authors and because of the presence of ovarian metastasis in 3 patients The radium applicator, called the hysterostat was designed to achieve a more equable distribution of radiant energy to all parts of the uterus Of the 10 cases 9 were moderately advanced or advanced but without induration of the pelvic ligaments, and were therefore considered operable Seven patients received unusually large doses of radium (6,030, 7,000, 7,000, 8,000, 8 900, 10,410, 12,480 milligram hours) followed by hysterectomy thirty-eight days to six months later Six of these 7 uteri showed residual carcinoma. The 1 case in which there was no remaining carcinoma after radium was an extensive undifferentiated tumor in a large

uterus treated with 12,480 milligram hours of radium One patient with early undifferentiated adenocarcinoma was treated with surgery alone. Three patients had ovarian metastasis This study suggests that radium alone will not completely eradicate adenocarcinoma of the uterus Subsequent excision of uterus, tubes and ovaries is necessary Recent reports suggest that panhysterectomy with bilateral salpingo oophorectomy should result in a five year arrest of 60 to 65 per cent of operable lesions The impression that the five year survival rate may be increased to 70 or 80 per cent by the use of preoperative radium followed by hysterectomy has been growing during the last ten years The authors think that the exact role and specific indications for preoperative radium therapy have not yet been satisfactorily delineated

Acute Pulmonary Edema Associated with Mediastinal Emphysema F T Wallace —p 430

**Preoperative Dietary Management for Surgical Patients**—Varco says that, more frequently than seems to be appreciated, patients ill with diseases remediable by surgery present mild to severe states of starvation or malnutrition A failure to recognize the importance of the concomitant effects that may develop from an inadequate nutrition (fatty liver, decreased hepatic function, hypoproteinemia) increases the hazards of surgery Adequate preparation with appropriate diets lessens these dangers These "poor risk" cases can be accepted for operative procedures tolerable to standard risk cases without augmenting seriously the risk, if good dietary preparation has been achieved A diet rich in proteins, carbohydrates and calories but low in fats is best High protein content has been achieved by fortifying several vehicles with milk powder which contains all the essential amino acids Similarly lactose, cane or beet sugar or cerelose (dextrose) was added to attain the high carbohydrate content The fat content has been reduced to minimal values Two diets developed on this plan are most frequently employed Diet I is palatable and comes in multiple servings during the day Diet II is designed for tube feedings and is less palatable but is taken readily by mouth by most patients These diets have been used in the routine care of several hundred surgical patients The percentage of body weight loss is probably the best guide for the duration of the feeding program Despite the lack of confirmatory evidence obtained under rigid experimental conditions indicating that dietary preparation lessens the risk of formidable operations, the clinical evidence on this score is overwhelming as suggested in a number of the case reports detailed in this study

**Causalgia Secondary to Injury of Major Peripheral Nerves**—Patients suffering from causalgia continue to be admitted to hospitals with a diagnosis of severe psychoneurosis and prolonged delay in treatment has been a usual occurrence. During this period of delay the changes of disuse affect the extremity This is of particularly serious import when the hand is involved Despite the lack of an adequate explanation for the etiology of the pain, interruption of the sympathetic nerve supply to the extremity greatly modifies or abolishes the symptoms of the disease During the past twelve months 67 patients have been admitted to Allbritten and Maltby's hospital with injury to a major peripheral nerve and causalgia of sufficient severity to warrant some form of treatment. The seat of the maximum pain has been in the distribution of the posterior tibial nerve or the median nerve Thirty of this group desired sympathectomy after experiencing relief by sympathetic block Of this group 22 had lumbar sympathectomies and 8 had preganglionic dorsal sympathectomies Good to excellent results were obtained in 28 of the patients Failure to relieve symptoms and reestablish use of the affected part occurred in 2 patients The sympathectomization should be of sufficient extent to include the area of injury as well as the area of symptoms Early sympathectomization will, in the vast majority, relieve the symptoms of the disease and prevent the profound disabilities of disuse

**Tropical Headache**—Woods and Stutzman examined 20 young men suffering from severe incapacitating headache for which no specific cause could be found Five patients had severe unilateral frontotemporal headaches the remaining 15 patients had bilateral frontal headaches The unilateral type is to be considered as caused by abnormal extracranial vasodilatation The pain is conducted by afferent fibers coursing along the vessels and may often be relieved by selective arterial resection The unilateral pain did not respond to therapy consisting of increased salt solution and calcium intake or of neostigmine injections It was made worse by heat and exertion and by jugular compression produced by a blood pressure cuff about the neck inflated to 35 mm of mercury for three minutes The second type represented by the 15 cases of bilateral frontal headache is to be considered as arising from intracranial vascular structures In all these cases the headache was made worse by heat and exertion but was often improved by the jugular compression test Carotid occlusion seemed to relieve the headache on that side only and often made the pain worse on the opposite side Occlusion of extracranial arteries had no effect. Since the headache was accompanied by decreased intracranial pressure in the upright position made worse by lowering the level further and abolished by raising the pressure, it could be assumed that traction on the intracranial vessels was a factor This type of headache was definitely aided by increased salt, calcium and fluid intake and by injections of neostigmine methylsulfate

**Hemoglobinuria Due to Pamaquin** —Dimson and McMartin encountered hemoglobinuria in 13 of 10 000 Indian troops who received pamaquin (plasmochin) during blanket treatment and in 5 of 8 000 patients who received it during routine treatment of malaria The authors use the term blanket treatment' to describe a course of treatment given to men withdrawn from a malarious area to one which is nonmalarious on the assumption that they have already developed subclinical malaria Three deaths occurred in the group given blanket treatment' Clinical and postmortem findings were identical with those described in classic blackwater fever Treatment was usually by absolute rest, fluids and alkalis Etiologic factors discussed include lack of rest dosage batch toxicity race, suppressive quinacrine malaria blackwater fever liver damage and toxicity of pamaquin The term blackwater fever describes a syndrome which has several causes Definition on an etiologic basis is desirable Thus hemoglobinuria due to malaria quinine quinacrine or pamaquin are terms which are preferable, being more accurate, though there may be common underlying factors present in varying degrees As far as pamaquin hemoglobinuria in the present series is concerned malaria appears to play a lesser role than it does in classic blackwater fever (malarial hemoglobinuria) Oversusceptibility to pamaquin is held to be the determining factor in producing the hemoglobinuria with the previous administration of quinacrine an important contributory cause

**Sulfonamide Therapy for Brain Abscess** —Piquet reports the results of sulfonamide therapy of 15 patients operated on for brain abscess of otitic origin Nine had a cerebral abscess and 6 a cerebellar abscess Six patients with cerebral abscess and 2 with cerebellar abscess recovered Treatment consisted in surgical removal of the initial focus drainage of the abscess, allowing an iodoform drain to remain in the cavity and occasionally of decompression trephining Eight to 10 Gm of the sulfonamide compound was administered daily for one week, and treatment was continued with smaller doses depending on the improvement Two patients had recurrence of the abscess Sulfonamide therapy apparently improves the prognosis of a cerebral abscess by checking the encephalitis in the adjacent area of the abscess but control of the patient for the next three months is essential because of occasional recurrence Increased cerebral pressure may be relieved by puncture of the dura in the area of the primary abscess An iodoform drain should be placed in the cavity for two to three months and be changed every eight to ten days Neither local nor general sulfonamide therapy was effective in cerebellar abscess It was demonstrated that the white substance of the brain fixed twice the amount of sulfonamide as the cerebellar tissue

Metastases of Cancer of Prostate M Loeper and J Tremolieres —p 69
*Calcium Metabolism in Course of Cancer of Breast and of Cancer of Prostate with Bone Metastases. J and Jacqueline Loeper —p 70

**Calcium Metabolism in Cancer with Bone Metastases** —The Loepers studied 14 cases of cancer of the breast with bone metastases In 13 cases the metastases were of the osteolytic type, and in only 1 case were osteoplastic metastases present In 9 cases there was an abnormal rise of blood calcium up to 128 mg By comparing the level of blood calcium with the extent of the osteolytic process it was demonstrated that higher calcemia corresponded in general to a larger extent of the osteolytic lesions but 2 patients with a calcemia of 100 and 110 mg presented a fairly extensive osteolytic process and a third patient with a calcium blood level of 100 mg presented an extensive osteolytic process Because of the regulating system of the blood calcium level, the calcemia does not always give an exact picture of calcium mobilization The calcium balance of 3 patients was determined The first patient showed a pronounced negative balance there was an extensive osteolysis a calcemia of 124 mg and a mean daily calcium loss of 188 mg Patient 2 showed an even more pronounced negative balance with extensive osteolysis a calcemia of 100 mg and a mean

daily calcium loss of 895 mg The third patient showed a positive balance, a mild osteolysis, a calcemia of 116 mg and a mean daily calcium excess of 95 mg In general the calcium balance of patients with extensive osteolytic lesions is negative In the same patients the calcemia is more pronounced when less calcium is lost by the excretory organs, and inversely Renal and intestinal factors have some influence on the elimination rate of the mobilized bone calcium Extracts of tumors of the breast were injected subcutaneously in rabbits and in dogs A permanent hypercalcemia resulted in 4 of 7 animals, the increase in calcemia varied from 8 to 35 mg It is suggested that cancer cells are endowed with osteolytic internal secretion and that the effect of the osteolytic principle may be similar to that of parathyroid extract The parathyroid reaction given occasionally by patients with cancer of the breast in which there are osteolytic metastases is not constant and is secondary to the osteolytic process caused by the cancer cells It is a primary defense reaction which surpasses its aim and in turn aggravates the osteolytic process Study of 2 patients who had cancer of the prostate with bone metastases demonstrated that the metastases were osteoplastic, they were not associated with hypercalcemia, and there was a positive calcium balance

Vitamin Resistant Rickets. Marlies Lüssy —p 11

**Pontine Tumors in Infancy**—To 5 cases of tuberculoma pontis collected from the literature Janssen adds a sixth of her own observation, her patient being a little girl in whom symptoms appeared when she was 3½ months old and who died at 9 months Necropsy revealed a ganglioneuroma or a ganglioglioneuroma which had spread from the caudal portion of the pons to the left half of the cerebellum and to the medulla oblongata All 6 patients had lesions of one or several of the cerebral nerves, but the symptoms of the pontine tumor in the author's patient showed greater multiformity than in the others She thinks that this may be due to the extensive and infiltrating growth of the ganglioneuroma.

Complications During Convalescence of Patient with Typhoid Orchiepididymitis and Spondylitis. J M. Reyes Terra and J Dubourdieu (h) —p 512

**Accidental Malaria by Transfusion.**—Talice and Mackinnon present the histories of 2 patients who developed malaria after they had received transfusions of fresh blood. In both patients the malaria was produced by Plasmodium malariae Both responded to quinine therapy Investigation of the donors revealed that *1 had acquired malaria* nine years before in Africa and the other seven years before in Italy The authors stress that malaria and syphilis are the two diseases that must be watched for in selecting donors for blood transfusions, regardless of whether the blood is to be used fresh or is to be stored. Since malaria is not endemic in Uruguay they think that, if only persons who have never been outside Uruguay are used as blood donors, accidental transmission of malaria by blood transfusion will be avoided

**Treatment of Parathyroid Tetany with Vitamin $D_2$**—Eleven patients who had parathyroid tetany were treated by Schultzer and Christensen with ultranol fortior, an oil solution containing 300,000 international units of vitamin $D_2$, i e. 7 5 mg in 1 cc, which corresponds to 0 25 mg in one drop Nine of the patients had developed symptoms after a subtotal strumectomy for hyperthyroidism In 1 patient strumectomy with removal of practically all parathyroid tissue was performed for a large adenoma of the parathyroid One patient suffered from idiopathic tetany Ten of the patients were women between the ages of 23 and 48, and 1 was a man aged 33 All the patients had previously been treated with dihydrotachysterol, of which they received between 1 33 and 5 mg daily The reaction of the patients to dihydrotachysterol was not uniformly ideal, since some of them presented mild hypocalcemia Dihydrotachysterol was replaced by vitamin $D_2$, and the dose adjusted so that the patients presented a normal blood calcium level The daily dose was 1 to 4 5 mg of D Dihydrotachysterol may be safely replaced by vitamin $D_2$ The amount of vitamin D to be given should be somewhat smaller (on an average about 25 per cent) than that of dihydrotachysterol For the treatment of acute cases of postoperative parathyroid tetany 5 mg of vitamin $D_2$ daily will generally be adequate, additional intravenous injections of calcium chloride or calcium gluconate may be given for the first few days In the cases studied there occurred a prompt rise of the serum calcium concentration, which continued for from one to five months until the maximum effect of vitamin $D_2$ was obtained. When adjusted the patients felt as well under treatment with vitamin D as they did when treated with dihydrotachysterol

# Book Notices

**The Sulphonamides in Theory and Practice** By J Stewart Lawrence M.D M R C.P Cloth Price 9s Pp 125 London H K Lewis & Co Ltd 1946

In the preface the author states that "the spate of new drugs of this class seems to be warning and recent work has been concerned more with consolidating our knowledge of the old ones Time therefore seems opportune to attempt a brief survey of the facts which have been evolved" He has succeeded in crystallizing the present status of sulfonamide therapy, drawing heavily on the literature rather than on his personal experience for his information. There is an excellent summary of the mode of action and the pharmacology of the sulfonamides Included in the discussion are phthalylsulfathiazole and homosulfanilamide. There is a well timed chapter on common abuses of the sulfonamides In a concluding section on sulfonamides or penicillin the author devotes only one and one-half pages to this important feature of the subject. In general, the material is presented clearly and concisely Pertinent references to the literature are given This monograph can be recommended to the practitioner who desires a comprehensive and up to date survey of the subject.

**Human Embryology (Prenatal Development of Form and Function)** By W J Hamilton M D D Sc F R S E Professor of Anatomy in the University of London at the Medical College of St Bartholomew's Hospital J D Boyd M.A M.Sc. M.D Professor of Anatomy in the University of London at the Medical College of the London Hospital and H W Mossman M.S Ph.D Associate Professor of Anatomy in the University of Wisconsin Madison Cloth Price $7 Pp 366 with 364 illustrations Baltimore William Wood & Company 1945

This book may well be taken by other medical authors as an example to emulate. The text is well written, the beginning student will find the expositions of developmental processes remarkably clear The style is delightful and never becomes stodgy Without sacrificing scientific accuracy, the authors have succeeded in avoiding the dry, boring flavor one meets so often in textbooks One reason for their success may be the frequent references to the literature. The illustrations are excellent They have been well chosen and excellently drawn and reproduced. Many are three dimensional They serve admirably to clarify points which might be difficult for the reader to visualize from descriptions The book is printed on good paper and is well bound. One could wish that the page had been printed in two 3 inch columns instead of one 6 inch column. There is a full list of references at the end of each chapter The authors have displayed excellent judgment in the space allotted to the various topics Development of the human embryo is emphasized, although there are chapters on experimental and comparative embryology This book will become popular with medical teachers and students

**De behandeling van hypertensie met zoutloos dieet en met uitdrijving van keukenzout Een klinische en haemodynamische studie** Door Hendrik Johan Viersma [Therapy of Hypertension with Salt Free Diet and with Elimination of Salt Clinical and Hemodynamic Study ] Academisch proefschrift ter verkrijging van den graad van doctor in de geneeskunde aan de Universiteit van Amsterdam Paper Pp 322 with 22 illustrations. Amsterdam N V Noord Hollandsche Uitgevers Maatschappij 1945

Although the use of a salt poor diet for the treatment of hypertension was first recommended about forty years ago, the rationale of its use and its value in this disease has been a subject of controversy With the renewed interest in the experimental and therapeutic study of hypertension, several groups of investigators have recently once again undertaken a study of the effects of drastic salt restriction on the blood pressure and the value of this form of therapy clinically In the monograph under review, Viersma has surveyed in great detail the earlier literature, not only on the effect of salt restriction, but also on the various hemodynamic factors and salt and water metabolism in the organism and renal factors which might be affected by salt restriction In addition, careful and well controlled observations were made on 8 patients with essential hypertension 2 with chronic nephritis and 4 with malignant hypertension, who were studied over periods varying from seventy-two days to two and a half years All the patients studied were in the older age groups, the youngest being 35 and the others 45 or older As is well known, the drops in pressure observed during drastic salt restriction are less in the older persons, which was also the experience of the author In addition to the salt free diet, ammonium nitrate and salyrgan to deplete further the organism of salt were added as an adjuvant form of therapy The author concludes that the combination of drastic salt restriction with the use of a mercurial diuretic is to be recommended in the treatment of hypertension, particularly in those who manifest serious symptoms of heart failure, angina pectoris, hypertensive retinopathy or vascular crises However, in malignant hypertension and in the presence of poor renal function, salt restriction alone without the use of a mercurial diuretic is advocated In the acute stage of myocardial infarction, salt deficiency is contraindicated

The author is to be commended for a carefully controlled and well documented study which demonstrates again the value of drastic salt restriction in the treatment of hypertension However, much still remains to be learned before the mechanism involved in this process will be elucidated.

**Diagnostic Psychological Testing The Theory Statistical Evaluation and Diagnostic Application of a Battery of Tests** By David Rapaport Ph D With the collaboration of Merton Gill M D and Roy Schafer B S Volume I The Menninger Clinic Monograph Series No 3 Cloth Price $6 50 Pp 573 with 38 illustrations Chicago Year Book Publishers Inc 1945

In this volume seven psychologic tests are evaluated The authors made a serious attempt to present not only the technical aspects of psychologic testing but also the kind of material useful to the clinical psychiatrist. There is no doubt about the importance of psychologic testing and the efforts of the authors emphasize the importance of obtaining psychologic information from the test performance in addition to a diagnosis of intellectual capacity In the effort to obtain information additional to the test scores the authors have fallen into several serious errors For example, in the foreword the authors state that they did not advocate a mechanically standard procedure of administering the tests but one which would create optimal conditions This statement seems plausible but actually makes the rather curious assumption that the psychologist can change the standard methods to suit a particular situation If this is done it is obvious that there are no standard methods, and the authors constantly refer as they should to the fact that scientific data in the field of testing can be obtained only if scientific methods are rigorously used That the authors are somewhat confused regarding the use of standard methods and of subjective observation is further brought out by their statement on page 3 that in psychologic testing more or less standard scoring systems are used Again, on page 10 in speaking of the word association test, the statement is made that this test lost its usefulness because it was mechanically applied and statistically treated. The authors then state that they introduced a systematic qualitative point of view Any psychologist who has labored in his laboratory in order to standardize and quantify psychologic methods and to create a science out of the subjective psychology of the nineteenth century will probably be shocked by such statements The fact that the authors adapted the tests to suit the patient s needs (p 13) and that the psychologist s attitudes varied from individual to individual indicates a somewhat contemptuous attitude toward rigorous scientific method. This is probably inconceivable in view of the excellent work of these authors it may well be that the pressure of the clinicians for interpretative material created attitudes which tended to make the testing subjective rather than objective.

The discussion of the tests is excellent, and the book is readable

**The Diagnosis of Nervous Diseases** By Sir James Purves Stewart K C M G C B Ninth edition Cloth Price $11 Pp 880 with 358 illustrations Baltimore William Wood & Company 1945

This is a good book on neurologic diseases The author is well known and has followed the study of nervous diseases for over forty years Because of this, one finds material or facts about almost all the diseases of the nervous system. It is up to date and is highly recommended for medical students and general practitioners

## REACTIONS FROM INTRAVENOUS GLUCOSE SOLUTION

*To the Editor* —Why do glucose solutions produce a reaction with chills and a rise of 2 or 3 degrees of temperature if the glucose solution is pyrogen free and the appliance and needles autoclaved? M D Minnesota

ANSWER.—Pyrogens are chemical substances which are elaborated by bacteria which may grow even in distilled water Many species of bacteria produce these substances but the most common source are the types found in river water The name is derived from the fact that the substances produce febrile reactions when injected parenterally Pyrogens pass through most bacterial filters and are not inactivated by the heat applied in autoclaving solutions or equipment for parenteral therapy (Seibert, F B Fever-Producing substances Found in Some Distilled Waters, *Am J Physiol* **67** 90 [Dec.] 1923, **71** 621 [Feb.] 1925)

In the preparation of equipment for parenteral therapy two steps must be observed 1 The equipment must be thoroughly washed with pyrogen-free solutions, such as distilled water which has recently passed through a proper still 2 The equipment then must be autoclaved within a few hours (approximately six) to destroy any bacteria which may have been introduced after the cleansing

If a solution of dextrose was employed which was manufactured commercially and tested for pyrogens then the pyrogenic substances must have resulted from the imperfect preparation of the rubber tubing and other apparatus In such a case the pyrogens could be washed out by allowing the first 100 to 200 cc of the dextrose solution to be discharged through the apparatus and discarded before the injection into the patient is begun The occurrence of pyrogens in the equipment for parenteral therapy is a strong argument for entrusting the preparation of such equipment to a few trained personnel in the hospital

## ATTACKS OF DYSPNEA AND COUGH

*To the Editor* —A physician aged 63 has been suffering from repeated attacks of early morning dyspnea and cough raising phlegm He is relieved by whisky and oxygen It has lasted four months without sign of improvement Now although slightly improved attacks continue The electrocardiogram reveals left bundle branch block There are recurring attacks at three or four day intervals and heavy sweats in the morning I am requesting information relative to additional treatment particularly if digitalization is indicated under these conditions

M D New Jersey

ANSWER.—From the information given, it is impossible to make a definite statement with regard to digitalization Digitalis is indicated if there is any evidence of congestive failure or if there is auricular fibrillation with a rapid ventricular rate As mention is not made of these conditions, digitalis is presumably not indicated. The left bundle branch block may be considered evidence of myocardial damage but not the cause per se of any of the signs or symptoms of congestive failure Many patients exhibit bundle branch system block for years without any cardiac symptoms

Although no mention is made of physical findings it is possible that this condition may be due entirely to pulmonary disease Chronic bronchitis or bronchiectasis can cause these symptoms The occurrence of these episodes in the early morning is suggestive of bronchiectasis, though other pulmonary conditions such as neoplasm must be considered It is important especially in a 63 year old man that the etiology of such a condition be established It is suggested that in addition to a more complete cardiac examination a complete study of the lungs be made including x-rays of the chest bronchograms and if necessary bronchoscopic examination

## PENICILLIN FOR COLDS

*To the Editor* —What success has there been in the prevention or treatment of colds by the use of penicillin? M D Iowa

ANSWER.—Penicillin does not seem to be of value in the prevention and treatment of colds Up to the present time penicillin has not proved valuable in the treatment of any virus infections If colds are complicated by acute sinusitis due to penicillin susceptible organisms then penicillin may be used

## VITILIGO

*To the Editor* —A woman with vitiligo is being given gold sodium thiosulfate 100 mg intravenously twice weekly and bergamot oil solution 10 per cent in 95 per cent alcohol applied twice daily Coincident with this treatment she is supposed to get five minute exposures of ultraviolet rays without the sun tan effect on the skin twice weekly The patient has had ten weeks of treatment with the gold sodium thiosulfate and the bergamot oil but no ultraviolet radiation She now wishes to begin the treatment over taking the ultraviolet radiation along with the other medication In case this should not be done will it have the desired effect if she takes the recommended ultraviolet radiation without any other medication? Will you please discuss the outlined treatment for vitiligo? What type of carbon arc lamp is most desirable for ultraviolet rays with the least amount of sun tan?

M D West Virginia.

ANSWER.—There is no effective therapy for the treatment of vitiligo Gold sodium thiosulfate has been used for this purpose, but the proportion of favorable results is so small that it seems questionable whether it is advisable to expose the patient to the possible toxic effects of gold salts, particularly in large doses such as are being used in this instance The use of bergamot oil with ultraviolet irradiation is based on the observation that in certain persons hyperpigmentation of the skin has developed when patients have applied toilet waters containing essential oils to the skin and have then been exposed to sunlight. Unfortunately this method of treatment has practically no effect on depigmented areas in vitiligo In exceptional instances the pigment returns spontaneously in cases of vitiligo, and it is entirely possible that in cases in which favorable results have been obtained, either while using gold salts or employing bergamot oil and the ultraviolet method or a combination of the two methods, the improvement is coincidental

## AMPHETAMINE AND DEXTROAMPHETAMINE SULFATE

*To the Editor* —Amphetamine (benzedrine) and dexedrine sulfate have been given to patients complaining of depressive states bordering on melancholia with a great deal of temporary symptomatic relief What deleterious effect might be produced by the continued use of either of these drugs over a long period aside from the possibility of producing a drug habit? Is there any difference in the two drugs aside from their chemical composition?

T A Moran M D Melrose Iowa

ANSWER.—Benzedrine sulfate (racemic amphetamine sulfate) has been given daily over a period of years in the treatment of narcolepsy without any apparent ill effects attributable to the long continued administration and rarely if ever with the development of tolerance Dexedrine sulfate (dextroamphetamine sulfate) is about one and one-half to two times as active as the racemic amphetamine in its central nervous system stimulating effect. The peripheral actions of the two drugs are essentially equivalent Hence, when used as a central stimulant, dexedrine is claimed to have fewer undesirable side-effects

## FATE OF BEESWAX IN PENICILLIN MIXTURES

*To the Editor* —What is the fate of beeswax which has been injected intramuscularly? Is it completely absorbed or does it act like paraffin? Does it induce much fibrous tissue formation?

M D California

ANSWER.—Beeswax is removed from the tissues by phagocytosis Twenty-four hours after the intramuscular injection of penicillin in beeswax and peanut oil the particles of beeswax are separated by collections of polymorphonuclear cells large mononuclear cells and foreign body giant cells No muscle necrosis is associated with this reaction the fibers merely being separated Beeswax usually disappears by the thirtieth day Very little fibroblastic reaction occurs and that disappears within several months In human beings who died from various causes one or two months after receiving penicillin in beeswax and peanut oil numerous sections of the muscle were necessary to find the site of injection and beeswax was not identified At this time minute cysts some partially collapsed having thin fibrous walls with scattered giant cells are present.

## OCCIDENTAL BERIBERI HEART DISEASE

M A BLANKENHORN M D C F VILTER M D
I M SCHEINKER M D and R S AUSTIN M D
Cincinnati

Although descriptions of beriberi date far back in the oriental literature the modern concept of heart disease due to beriberi is dominated by the vivid descriptions of Wenckebach[1] in the Far East and by the observations of Weiss and Wilkins[2] in the United States Beriberi has not, however gained much recognition in the etiology of heart disease in this country even though the descriptions of the latter authors have been readily available

In collaboration with Aalsmeer a physician in Java, Wenckebach[1] described in 1932 a large heart, particularly the right side, with precordial pulsations and a 'jumpy pulsus celer of increased frequency" in persons with slight to absent neurologic findings and beginning dependent edema These patients had "curious hardness and swelling of the calf muscles," 'pistol shot sounds" over the larger arteries and peripheral vasodilatation and there was "quick and great benefit" afforded by rest Shock and syncope were frequent He confirmed the allegation of Shimazono and of Aalsmeer that epinephrine had an unfavorable effect on this state, that paradoxically, vasodilatation increased after administration of epinephrine All these signs of a rapid circulation in the face of heart failure are found in most descriptions of the disease in the Orient Keefer,[3] however, while at Peiping China, in 1930 noted the fast circulation in only a third of his patients The banal signs of the others were fatigue palpitation and dyspnea, symptoms which could occur with failing myocardium of any cause

Weiss and Wilkins,[4] describing the picture in 35 instances of beriberi heart disease in the Boston City Hospital, again emphasized the rapid circulation This was, however by no means the rule and these authors concluded that the disease was confined to no rigid syndrome

The large group of cases of beriberi heart disease without the rapid circulation which closely resembles other types of degenerative heart disease still escapes frequent recognition Some of the reasons for this become apparent after studying the cases of this disorder seen in the Cincinnati General Hospital in the last five years It seems that the oriental concept of beriberi heart disease as characterized by Wenckebach's vivid criteria probably hindered the diagnosis in many instances The clinical picture of the failing heart with exceedingly rapid circulation is not likely to be overlooked, it is, however readily remembered in preference to the majority of less dramatic case studies presented in this hemisphere[5] In our studies the combined skill of the nutritionist the cardiologist, the neurologist and the neuropathologist was applied to the material at hand From this study evolved a new and less rigid set of criteria for the diagnosis of beriberi heart disease This reorganization of the requirements, in harmony with modern concepts of nutrition cardiology and neurology, has been described by one of us[6]

This report is concerned with the available material afforded by the study of the 12 cases which were diagnosed in the five years that began in 1940 Since there were approximately 12 000 medical admissions in this period, the incidence was 0 1 per cent Five of the patients in this group died in the hospital, and three autopsies were performed

### CLINICAL OBSERVATIONS

The 12 cases conform for the greater part to the criteria described by Blankenhorn[6] These requirements are (1) insufficient evidence for other etiology, (2) three or more months on a thiamine deficient diet, (3) signs of neuritis or pellagra, (4) enlarged heart with sinus rhythm (5) dependent edema, (6) elevated venous pressure, (7) minor electrocardiographic changes and (8) recovery with decrease in heart size or autopsy consistent with beriberi heart disease

First thought of beriberi usually came with the realization that the etiologic nature of the heart disease was obscure Initial and final elimination of coronary arteriosclerosis as a cause was always difficult None of the patients suffered from angina or precordial oppression There was seldom any persistent fever or persistent leukocytosis which might suggest Fiedler's isolated myocarditis Since 11 patients were men and since the only woman was 56 years of age postpartum myocardosis did not enter the differential diagnosis We

have not observed the "idiopathic hypertrophy with mural thrombosis' described by Dock

Alcoholism accounted for the poor dietaries of 11 patients The majority of the diets, as far as assessment was possible were deficient not only in thiamine but also in the other water soluble vitamins, particularly niacin riboflavin and ascorbic acid One patient, though an alcoholic addict had apparently been eating amounts of the essential nutrients which under normal conditions would have been adequate This person, however, proved to absorb many substances poorly In every instance the patient had been existing on a diet deficient in thiamine for longer than three months Although the work of Williams Mason and Smith [8] and Williams, Mason, Power and Wilder [9] suggests that three months may be in the region of the time limitation for the production of cardiac abnormalities only recently has transitory heart failure due to beriberi been induced [10] Certainly the time interval is probably subject to wide fluctuation, since the degree of hypovitaminosis, individual variations, the amount of activity, the presence of complicating disease and many other factors will influence the final nutritional balance. Actually ninety days is an arbitrary point selected to aid the evaluation of the problem

TABLE 1.—*Incidence of Alterations in Electrocardiograms of Ten Patients with Beriberi Heart Disease*

| | No of Cases |
|---|---|
| Low voltage of T waves and/or QRS | 7 |
| Inverted T waves in one or more leads | 5 |
| Premature auricular and ventricular contractions | 2 |
| Long PR interval | 2 |
| Depressed ST segments (digitalis) | 2 |
| Long QT interval | 1 |
| Tachycardia (90 or more) (Clinically 10 of the 12 had tachycardia) | 6 |
| Inverted $T_3$ and $Q_3$ | 1 |
| Bundle branch block | 1 |
| Auricular fibrillation and heart block | 1 |
| Known reversion to normal electrocardiogram | 4 |

In all 12 cases there was other clinical evidence of nutritive failure Always there was some indication of peripheral neuritis or of pellagra In 6 cases (1, 2, 4 5 6 and 12) evidence for both disorders was found This combination is to be expected and sought for, because of the concomitant natural occurrence usual for thiamine and niacin Pellagra was diagnosed in the presence of the typical acute erythematous and the chronic hyperkeratinized lesions of the skin or in the presence of the acute painful glossitis Although the question of the presence of peripheral neuritis sometimes was delicately dependent on the combination of tender calf muscles and absent ankle jerks alteration of other reflexes was usually observed along with changes in the sensory modalities, which were usually distributed in stocking fashion

There were numerous additional observations to support a diagnosis of nutritive failure. Eight of the 12 patients had anemia which in 3 instances was normocytic and in 5 macrocytic Hypoproteinemia was consistent In the 9 patients in whom it was measured the serum protein content ranged between 4 87 and 6 4 Gm per hundred cubic centimeters all but one of the values lying below 6 Two patients in whom gastric analysis was made had histamine refractory achlorhydria and 2 suffered from diarrhea Eight of the 12 showed unmistakable delirium and although in every instance it may have been due to alcohol or of the type that frequently accompanies heart failure, it may well have been nutritional in origin

Ten of the patients during life showed clinical and roentgenologic evidence of cardiac enlargement Patient 2 proved to have cardiac hypertrophy at autopsy, although this could not be demonstrated clinically Patient 1 suffered pulmonary infarction, but thrombotic and embolic manifestations were not evident in the others The cardiac rhythm was almost always sinoauricular In 2 instances premature auricular contractions were frequent In a third auricular fibrillation was finally abolished in favor of normal rhythm (case 5)

TABLE 2.—*Influence of Treatment on Course and Outcome of Beriberi Heart Disease*

| Case | Symptoms and Duration | Time Lapsed Before Giving Thiamine | Treatment | Recovery Period and Outcome |
|---|---|---|---|---|
| 1 H R | Dyspnea orthopnea weakness for 8 mo edema—2 days | 1 day | Thiamine intravenously for 5 wk digitalis last 3 wk. | Slight improvement over 2 mo sudden death |
| 2 H S. | † | None | Thiamine and niacin intramuscularly | Death in 8 days from acute pulmonary edema |
| 3 F R | Dyspnea weakness edema for 1 month | None | Thiamine intramuscularly and intravenously digitalis first 3 wk † | Moderate recovery in 6 wk probable relapse in 6 mo or year |
| 4 T B | Dyspnea—6 mo edema neuritis and weakness 3 wk | None | Thiamine intravenously mercupurin | Gradual recovery in 2 wk still alive 4 yr later |
| 5 J K | Dyspnea orthopnea and edema for 10 days | 4 days | Digitalis * first 21 days thiamine intravenously | Gradual recovery in about 1 wk no recurrence in 3 yr |
| 6 M D | Dyspnea 3 wk then progressive edema | 2+ days | Thiamine intravenously for 9 days | Rapid recovery in 1 wk convalescence prolonged over 4 wk no recurrence |
| 7 J D | Dyspnea edema—3 weeks | 2 wk | Thiamine intravenously | Steady and complete recovery in 1 wk |
| 8 G B | ? | None | Thiamine intravenously nicotinamide | Death second day |
| 9 J B | Nervous jaundice—3 weeks edema—2 wk dyspnea—1 wk | None | Thiamine nicotinamide Vit K. | Death following vomiting |
| 10 J B. | Dyspnea—1 yr edema—10 days | | Digitalis † diet | Moderately rapid recovery 25 days dead 3 mo later |
| 11 F K | Dyspnea edema—2 yr | | Digitalis † diet only | Slow recovery in 6 wk no relapse without digitalis—6 mo |
| 12 C B | Edema—6 mo ? | | | Death—24 hours |

* No effect † Questionable effect ‡ No immediate effect

The cardiac rhythm was almost always sinoauricular In 2 instances premature auricular contractions were frequent In a third auricular fibrillation was finally abolished in favor of normal rhythm (case 5)

Dependent edema was present in 11 of the 12 patients and elevated venous pressure was measured from the antecubital veins in 9 The edema frequently disappeared after the patient was in bed but a few hours

Most writers agree that the electrocardiographic changes are definite, but usually minimal and nonspecific [11] Such changes have been induced in subjects on thiamine deficient diets and abolished by thiamine administration [8] Electrocardiograms (serial) were

made in 10 of the 12 cases and showed abnormalities in all One, case 4, showed a depressed $T_3$ and shallow $Q_3$ suggestive of a remote posterior infarction In case 8 it revealed bundle branch block on the left side In case 5 there were remarkable alterations as the patient improved The first and second electrocardiograms demonstrated auricular fibrillation with the ventricular rate at 60 to 70, low voltage of the QRS complexes T waves of low voltage in all leads and inverted $T_{1,4}$ A day after the second record, the electrocardiogram showed sinus rhythm and first degree heart block, low voltage T waves and QRS complexes, and inverted $T_{3,4}$ Thirteen days later and again four years later it was normal except for a PR interval always longer than 0.20 second The most common discoveries throughout the group were low voltage and minor alterations in the T waves (table 1)

was rapid diuresis following the intravenous administration of thiamine and there was cardiac compensation How common in general this rapid response is cannot be ascertained The literature of the Orient is dated by the use of oral and impure preparations In those instances in which thiamine has been used parenterally an adequate control period of rest in bed has seldom been employed Some of our patients (10 and 11) improved on unrestricted diet and rest alone

The slow improvement following the parenteral administration of thiamine to 6 of our patients and also of patient 1, who died later and was examined post mortem, is certainly compatible with beriberi particularly protracted beriberi in which irreversible damage may have occurred in tissues responsible for the clinical picture of the heart disease A direct correlation (table 2) between a short duration of symptoms and

Almost any failing heart is dilated and sometimes hypertrophied As compensation recurs the heart decreases in size This is particularly true of the heart in beriberi of short duration and can be demonstrated best by the teleoroentgenogram This improvement with rest and with the administration of thiamine is one of the characteristics of the disorder Failing this, autopsy findings consistent with beriberi were considered of significance When beriberi heart disease was suspected the patient was put on a strict regimen which included rest in bed and a diet very low in thiamine A control period was pursued as long as the patient's condition permitted Large doses of thiamine were then given intravenously, doses of 50 to 100 mg were frequently employed simply in order that there might be no doubt that enough of the medicament had been given to be effective Although 7 of the patients improved and significant decrease in the size of the heart was demonstrated by x-ray in all 6 cases in which it was attempted only in case 6 was there dramatic improvement Here within twenty-four hours there a short period of recovery is not certain but seems likely The relation cannot be certified when it is dependent on the unreliable history of an alcoholic addict It must be correlated with the biochemical lesion of thiamine deficiency

The condition of the majority of the patients was critical when they came to the hospital Death occurred in 5, in 1 it was probably due to cholemia (case 9) In the others it occurred rather suddenly (cases 1, 2 8 and 12) In 3 of these autopsy was performed and observations were consistent with beriberi heart disease

Table 3 shows how the cases in this group fit in with the criteria which have been outlined The traditional signs of oriental beriberi were not wanting in some of the patients but their frequency was such as to confirm the diagnosis in less than half the cases Table 4 indicates the incidence of the signs which Wenckebach employed The severity of the signs and symptoms and the kind of criteria offered for the diagnosis of beriberi heart disease constitute an admission that we recognize the disease only in its latest stage

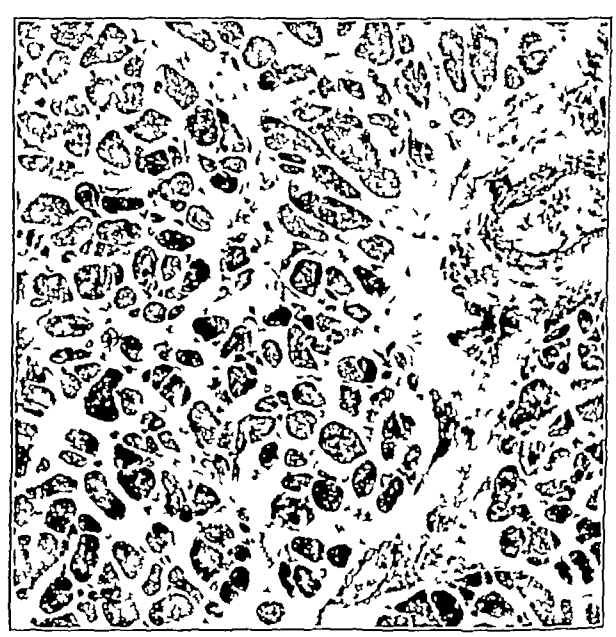
It is likely that the early changes are biochemical and give no clinical sign

Digitalis was given to 5 of the patients (table 2), and 3 may have benefited slightly from it There is some uncertainty as to the origin of the dictum that digitalis is of no aid in this condition and that if the heart responds well to this drug the diagnosis of beriberi is eliminated Certainly if the changes in the heart are purely degenerative and if failure occurs because of loss of tone" and "contractility" as Wenckebach [12] has suggested one would expect the administration of digitalis to help

TABLE 4.—*Beriberi Heart Disease Incidence of Traditional Signs Twelve Cases at Cincinnati General Hospital 1940 to 1945*

| Name | Age Sex | Circulation Time (Sec.) | Prominent Right Heart | Pedal Shot | Gallop Rhythm | Syncope or Shock | Critical Improvement After Thiamine | Comment |
|---|---|---|---|---|---|---|---|---|
| H R | 41 M | 0 40 | 0 | 0 | + | + | 0 | Died autopsy |
| H S | 46 M | ? | 0 | 0 | 0 | + | 0 | Died autopsy |
| F R | 33 M | 0 21 | + | 0 | + | + | 0 | |
| T B | 53 M | + 14 | + | 0 | 0 | 0 | 0 | |
| J K | 47 M | + 13 | + | + | 0 | 0 | 0 | |
| M D | 56 F | ? | 0 | 0 | 0 | 0 | + | |
| J D | 55 M | + 13 | 0 | 0 | 0 | 0 | 0 | |
| G B | 67 M | 0 32 | + | 0 | + | + | 0 | Died no autopsy |
| J B | 30 M | + 19 | ? | ? | 0 | + | 0 | Died no autopsy |
| J B | 53 M | + 11 | ? | + | + | 0 | 0 | 3 mo. after discharge dead on admission |
| F K | 48 M | + 17 | 0 | + | + | 0 | 0 | Korsakoff's psychosis |
| C B | 33 M | + 15 | 0 | 0 | + | + | 0 | Died autopsy |

On the other hand, organic heart disease can be complicated by beriberi heart disease We think that we can recognize some of these instances but methods of diagnosis are not refined to the point where the diagnosis is made with any frequency or certitude



### PATHOLOGIC OBSERVATIONS

Alterations in the myocardium in beriberi heart disease have been described and studied repeatedly for many decades without revealing a pathognomonic picture and without contributing to an understanding of the mechanism of the clinical picture Wright [13] and Wenckebach [12] found a heart which was large and dilated on the right side, consistent with their clinical observations More recent observations in this country, however, do not agree with the consistency of a lesion on the right side Weiss and Wilkins [4] found overall hypertrophy in 9 of 30 cases, dilatation alone in the remainder The microscopic picture they describe, hydropic degeneration of the myocardial fibers and the conduction bundle, "intercellular edema" and an increase in collagen, is not at variance with earlier or later authors It has been demonstrated, however, that the hypertrophy is not due to edema of the heart muscle [4]

At autopsy 1 of our subjects (case 2) showed dilatation of both chambers of the heart, the other 2 had hypertrophy as well In 1 there were petechial hemorrhages in the mural endocardium and in that covering the aortic and tricuspid valves All showed degenerative changes in the muscle fibers and "interstitial edema," as shown in the accompanying illustration These are the observations which are considered consistent with but not diagnostic of beriberi heart disease

The lesions of the nerves were essentially degenerative and involved the central, peripheral and autonomic nervous systems There was a triad of outstanding lesions present in both cases, namely, degenerative alterations of the cells of the nucleus sympathicus and of the tracts of the lateral horn in the upper cervical segments of the spinal cord, damage of the spinal cord roots and, finally, far advanced degeneration of the nervi vagi and of some of the peripheral nerve trunks In addition there were mild cellular changes within the sympathetic chain (*swelling and chromatolysis*) Similar cellular changes were frequently observed in cases of beriberi (Wright [13] and others) In view of the fact, however, that many factors may be responsible in the production of diffuse changes in nerve cells and since they occur in so wide a variety of diseases, such changes hardly can be interpreted as pathognomonic for the morbid process

Lesions found in the tracts (lateral horn) and roots of the spinal cord appear to be of somewhat greater significance. A review of the literature dealing with neuropathologic studies on beriberi in human beings failed to disclose a detailed description of these structures The lesions most frequently described in beriberi are those of peripheral neuritis (Wright,[13] Kursternan,[14] Eddy and Dalldorf,[15] Williams and Spies [16] and many others) Only occasionally are there mentioned alterations of the roots of the spinal cord (Rumpf and

Myocardial degeneration in case 12 Interstitial spaces are widened as if by edema and contain small amounts of granular material The parenchyma is granular and shows some vacuolization

Luce[17] Mendes,[18] Durck[19]) and of the dorsal columns (Wright,[13] Mendes,[18] Durck,[19] Vedder,[20] Hsu Ying-Kuei[21]) Wright, who reported a detailed study of a large series of cases of beriberi, concluded that "observed atrophy in the terminations of the vagal inhibitory fibers, in the heart muscle, axonal reaction in the cells of the ambiguus and vagal portion of the combined nuclei in the bulb are conclusive evidences that almost the entire cardiac nervous system is affected"

The lesions of the nerves observed in the present study showed for the first time degenerative alterations of the cells of the nucleus sympathicus and of the tracts of the lateral horn in the upper cervical segments of the spinal cord The exact mode by which the nervous regulation of the cardiac function is affected in beriberi is not known Is the primary site of damage in the spinal autonomic center followed by a secondary degeneration of the spinal cord roots and nervi vagi? Or does the process of degeneration progress centripetally from the peripheral terminations toward the spinal cord? It is beyond the scope of the present report to attempt to answer this pertinent question Additional information on beriberi in man including a careful study of the spinal cord and spinal cord roots will be needed to establish the significance of the lesions of the central nervous system in the pathogenesis of beriberi heart disease

## SUMMARY

In five years at the Cincinnati General Hospital we have been able to recognize beriberi heart disease in 12 patients, an incidence of 0 1 per cent of all medical admissions Five of these patients died in the hospital and 1 three months later at home From these studies we may draw the following conclusions The beriberi heart disease in this country is likely to be missed if one follows strictly the description given by Wenckebach Although the failing heart with the signs of fast circulation occurs and is a vivid picture the commoner type resembles any other type of degenerative heart disease Therefore other criteria have been established to aid in its recognition Important among these are the elimination of other etiologic agents, a diet deficient in thiamine for longer than three months and the presence of other evidence for nutritive failure, particularly neuritis or pellagra

The histories reveal that all the patients were chronic alcoholic addicts, but alcohol is not considered a direct cause of the disorder The onset varied, being either sudden or gradual and healing occurred in the same fashion Response to thiamine was not dramatic save in 1 instance It is thought that the duration and the severity of the deficiency play a part in the reversibility or irreversibility of the process

The autopsies of 3 of the patients revealed facts consistent with previous descriptions of beriberi, and in 2 instances in which the nervous system was examined definite lesions of the central, peripheral and autonomic nervous systems were revealed

## REPORT OF CASES

CASE 1.—*History.*—H R, a white man aged 41 a waiter was first brought to the hospital in 1939 because of chronic alcoholism and delirium tremens At that time a teleoroentgenogram of the chest showed the transverse diameter of the heart to be 14 cm in a chest of 29 cm On Oct 6 1943 he appeared in the heart clinic, where the attending house officer diagnosed beriberi heart disease and admitted him to the hospital Some eight months before he had been rejected at an army examination because of 'heart disease He knew of no signs or symptoms at that time but shortly thereafter began to notice dyspnea, orthopnea and weakness He continued to work until stricken by a cold and cough three weeks prior to admission There was some pain in the left anterior portion of the chest at that time, accentuated by a cough, and sputum of unknown nature was produced The dyspnea progressed and two days before his visit to the clinic his ankles swelled Because of the cold he increased his whisky and decreased his food intake He became nervous irritable and insomnious A variable story suggestive of neuritis was obtained by direct questioning on some occasions he admitted having numbness and tingling in the legs burning of the feet and cramps in the calves and on others he denied these symptoms

The only notes of significance in the past were that he had been a heavy drinker for twenty years and had experienced *anorexia during most of that time* An analysis of his diet was difficult, but it appeared to have been exceedingly low in protein thiamine and niacin and moderately deficient in riboflavin It was apparent that most of the caloric intake was supplied by alcohol

Incidental in the history were blindness of the left eye following a blow from a baseball at the age of 17 and progressive deafness of the left ear for six years

*Physical Examination.*—The temperature was 97 F pulse rate 120 respiratory rate 32 and blood pressure 110 systolic and 86 diastolic The patient displayed a varying amount of confusion and delirium and within a few hours it was necessary to restrain him He was orthopneic There was an external strabismus of the left eye and an opacity of the lens The outer edge of the tongue was smooth and somewhat reddened—other observers later described it as magenta with papillary atrophy along the edges The pharynx was diffusely injected The chest was clear The heart was enlarged to the right and the left There was a soft systolic murmur at the apex The pulmonic second sound was accentuated At times a diastolic gallop could be heard The liver was tender and extended 3 to 4 fingerbreadths below the costal margin the surface was soft and smooth There was moderate edema and cyanosis of the lower extremities The ankle jerks were weak and several observers could not agree on the presence or absence of peripheral neuritis as manifested by tenderness of the calves and stocking paresthesia

*Laboratory Examination.*—The count of red blood cells was 4 75 million hemoglobin content 17 Gm per hundred cubic centimeters and white blood cells 7,200 Urine gave a 2 plus reaction for albumin Circulation time with dehydrocholic acid was 40 seconds Venous pressure was 10 cm of water The vital capacity of the lungs measured 1 2 liters The serum protein content was 5 98 Gm. per hundred cubic centimeters Reaction of the blood to the Kahn test was negative. The electrocardiogram revealed sinus rhythm with a PR interval of 0.22 second QRS 0 10 second and T waves of low voltage in all leads A teleoroentgenogram of the chest showed pulmonary congestion and a diffusely enlarged heart with a transverse diameter of 18 cm. (in a chest of 28 cm.)

*Course.*—Delirium and hallucinations occurred intermittently for some weeks On the second day bronchopneumonia developed which cleared in a week with specific therapy The temperature varied between normal and 100 to 101 F the pulse rate between 90 and 120 and the respiratory rate between 22 and 46 for five weeks After the examination on admission the blood pressure was always low representative figures were 90/74, 74/60 86/74 and 100/78 The leukocytes varied between 7 000 and 15 000 Albumin disappeared from the urine

On the second day a course of thiamine 100 to 150 mg a day intravenously was begun This was supplemented with riboflavin and niacin amide and brewers' yeast throughout the hospital stay In the first few weeks the patient improved moderately but remained orthopneic and dyspneic There was *no azotemia, the icterus index was 23* At the beginning of

the fifth week the venous pressure was 8.5 cm of water and the circulation time was 42 seconds at this time digitalization was begun After receiving a calculated dose he was given 1 5 to 3 grains (0 1 to 2 Gm ) a day for the remaining days of life. In the second week of digitalis therapy there was some decrease in weight (7 pounds, or 3 Kg ) attributed to water loss but the gallop rhythm and accelerated pulse persisted. Electrocardiograms taken from time to time revealed a PR interval varying between 0.24 and 0 16 second, QRS usually 0 08 second notched and of low voltage and low or inverted T waves At the end of the fifth week (the first week of digitalis therapy) the x-ray revealed what was probably a pulmonary infarct in the right upper lung field With digitalis the patient seemed a little less dyspneic and the pulse rate varied between 88 and 100 The blood pressure remained low 115/70 to 95/60 the gallop rhythm was heard intermittently At the end of the seventh week x-ray examination at last showed a decrease in the transverse diameter of the heart from 18 cm to 16 cm At this time the patient was permitted to sit up in a chair but took the additional liberty of walking about. On the fifty sixth day he died suddenly in bed

*Necropsy*—At necropsy, diagnoses were cardiac hypertrophy and dilatation myocardial edema and moderate degeneration with generalized visceral congestion and edema, including the lungs

The microscopic changes in the nervous system, which are to be reported in detail elsewhere included degenerative changes in the cerebral cortex, degeneration of the nerve fibers confined to the lateral horn of the gray substance, destruction of the nerve cells of the lateral sympathetic nucleus and appreciable damage of the vagus phrenic and ischial nerves The alterations in the ganglions of the sympathetic chain were minimal

CASE 2—*History*—H S a Negro aged 46 an ice man, was brought to the hospital Aug 18 1942 A sister told of his chronic alcoholism and poor dietary For seven weeks he had shown some mental deterioration and had to be forced to eat

*Physical Examination*—The temperature was 102 F, pulse rate 100, respiratory rate 24 and blood pressure 76/50 The patient was poorly nourished, somnolent and disoriented The skin was dry and scaly in some areas The mucous membranes were pale The chest and lungs showed no abnormalities The heart did not seem enlarged rhythm was regular, the rate 100 no murmurs or gallop rhythm were heard There was slight tenderness in the upper portion of the abdomen on the right side although the liver was not felt Lesions on the legs were suggestive of pellagra Tenderness of the calves was considerable Deep reflexes in the arms were hyperactive and in the legs hypoactive General cutaneous hyperesthesia was more decided in the legs

*Laboratory Examination*—A teleoroentgenogram showed a heart of normal size (11 cm in a chest of 26 cm ) The bronchovascular markings were accentuated The urea nitrogen content of the blood, 102 mg per hundred cubic centimeters two days after admission, fell to 24 mg on hydration. Reaction of the blood to the Kahn test was negative The serum calcium content was 11 1 mg per hundred cubic centimeters No free acid was present in gastric secretions Three stool specimens gave positive tests for blood There was a macrocytic anemia red blood cells 2 2 million and hemoglobin content 9.2 Gm per hundred cubic centimeters, and white blood cells 7 600 Results of urinalysis were normal The cerebrospinal fluid was normal

*Course*—The temperature was subnormal for thirty-six hours Then followed an irregular course, never exceeding 100 4 F The pulse rate ranged between 70 and 110 Respirations were usually in the neighborhood of 30 a minute. Throughout his stay the patient had considerable diarrhea Measures were taken to restore hydration He was given transfusions of blood thiamine by the parenteral route and niacin daily As he responded a bit it seemed that he had a Korsakoff's psychosis The blood pressure varied between 95/54 and 122/80 After the first few days the liquid stools became black

On the eighth day he suddenly began to cough and to expectorate large quantities of brownish purulent, frothy sputum amounting to 200 cc. Coarse rales appeared at the base of the left lung and in the right axilla The attack subsided only to recur later in the day Choking on the large quantities of sputum, the patient died.

Pathologic diagnoses were myocardial edema, granular degeneration and atrophy, decided congestion and edema of the lungs peripheral neuritis, petechial hemorrhages in the aortic and tricuspid valves, beneath the endocardium and in the gastrointestinal tract. The nervous system was not examined in detail

CASE 3—*History*—F R, a white man aged 33, a bartender, was brought to the hospital in coma on Aug 14 1944 The record showed that he had been admitted for delirium tremens and chronic alcoholism three years before One month before admission he had experienced the onset of dyspnea weakness and edema of the ankles These became worse so that he could not climb stairs for two weeks before coming to the hospital Orthopnea had appeared three or four days earlier, and he quit work He was found unconscious and cyanotic by a relative on the day of admission He had been a heavy drinker for years and visited other bars after closing the one at which he worked His dietary was so irregular that it could not be definitely evaluated, but it seemed deficient in most nutrients

*Physical Examination*—The temperature was 100 F., pulse rate 70 and respiratory rate 36 Blood pressure could not be obtained and the patient could not be roused Extremities were cold and cyanotic the pupils dilated, the veins of the neck distended The heart sounds were of good quality with a regular rate of 70 As the blood pressure rose, a gallop rhythm became evident. Rales were heard over the upper lobe of the right lung The liver was much enlarged There was moderate edema of the ankles No reflexes were obtained

Despite distended neck veins, the patient was given an intravenous injection of 1 000 cc. of 5 per cent glucose in saline solution and then 100 cc of 50 per cent glucose, caffeine, nikethamide, oxygen, thiamine and niacin were included in the drugs given in the receiving ward In the medical service shortly thereafter he was given 4 units of plasma (1,200 cc.) After 2 units the blood pressure was 80/50 Venous pressure was 29 cm of water Circulation time with papaverine hydrochloride was 17 seconds When the blood pressure reached 140/90 that night the patient finally responded well A 30 inch roentgenogram of the chest showed a homogeneous density over the entire right lung field and increased bronchovascular markings on the left. On the following day (first hospital day) physical examination revealed certain alterations The blood pressure was 150/90 the heart rate 120 The pulse became bounding The apical impulse was felt 12 cm to the left of the midsternal line Gallop rhythm persisted There were signs suggestive of pneumonia over the right upper lobe of the lung Edema had disappeared and there was moderate peripheral neuritis in the legs The patient passed a tarry stool Laboratory examination revealed white blood cells 22,000, no anemia, normal urine, and stool positive for blood The electrocardiogram showed low voltage T waves $T_3$ inverted $ST_{1-3}$ depressed. The urea nitrogen content of the blood was 27 mg per hundred cubic centimeters

*Course*—The patient was given sulfadiazine and digitalized The temperature and pulse remained elevated On the fifth day the venous pressure was 5 cm of water and the circulation time with dehydrocholic acid was 20 seconds The administration of 50 mg of thiamine intramuscularly daily was begun at this time and that of sulfadiazine was discontinued On the second day a teleoroentgenogram of the heart showed the greatest diameter to be 14 5 cm in a chest of 27 cm One week later it measured 12 5 cm During this time although the fever cleared, the elevation of the pulse rate persisted, 96 to 120 The administration of digitalis was discontinued on the twenty-first day General improvement continued although there was wide variation in the pulse rate On the forty first day x-ray studies demonstrated the transverse cardiac diameter to be even smaller, 11 cm An electrocardiogram at this time showed sinus rhythm 100 $T_1$ of low voltage and diphasic $ST_3$ slightly depressed The patient was discharged on the fifty-third day, his pulse still somewhat accelerated his blood pressure 114/72 and the vital capacity normal

He was known to be alive a year later but was still a confirmed alcoholic addict and had edema of the ankles and dyspnea

CASE 4.—*History.*—T. B., a white man aged 53, was admitted on Dec. 25, 1941 complaining of swelling, numbness, tingling and weakness of the legs which had persisted for three to four weeks. A brief hospitalization in 1940 for corneal ulceration revealed that he was a chronic alcoholic addict consuming 2 to 3 glasses of beer, ½ pint of whisky and ½ to 1 quart of wine daily. At that time he apparently showed some signs of mental deterioration.

The present illness began two years before with nervousness and increased consumption of alcohol. Unwarranted dyspnea on exertion was first noted during the previous summer. For three weeks there had been increasing swelling of the feet and angles, and the legs felt numb. Weakness progressed rapidly in this time and made the patient bedfast. His diet had been made up largely of bread and canned soups.

*Examination.*—At the initial examination the temperature was 98 F., pulse rate 90, respiratory rate 26 and blood pressure 150/80. The patient was lying flat in bed and was confused and euphoric. There was diffuse pellagrous erythema of the lower extremities. The corneal ulcer of the right eye was healed with scarring. A few fine rales were heard at the bases of the lungs at the height of inspiration. By percussion the heart seemed of normal size. There were no murmurs. Premature contractions were infrequent. The pulmonic and aortic second sounds were equal. There was rather vigorous venous pulsation in the right side of the neck. A massive soft edema extended above the sacrum. The calves were tender, the knee jerks and ankle jerks absent. There was a stocking type of hyperesthesia of the lower two thirds of the legs and considerable weakness of both lower extremities.

On the second day a teleoroentgenogram of the chest showed the heart to be enlarged, 15 cm. in a chest of 28 cm. There was some widening and elongation of the aorta. There was evidence of pulmonary congestion and of a small amount of fluid in the right hemithorax. An electrocardiogram showed a sinus rate of 80, P-R interval of 0.18 second, an inverted $T_3$ and a $Q_3$. There was a mild macrocytic anemia; red blood cells numbered 2.75 million, the hemoglobin content was 10.7 Gm. per hundred cubic centimeters; white blood cells numbered 4,900 with a normal differential count. On analysis the urine and stool were not remarkable. The reaction of the blood to the Kahn test was negative. Lumbar puncture revealed no abnormalities. The serum protein content was 5.85 Gm. with albumin 3.52 Gm. and globulin 2.33 Gm. per hundred cubic centimeters. The nonprotein nitrogen content was 28 mg. per hundred cubic centimeters. On the fifth day after a struggle the venous pressure was 19.5 cm. of water and the circulation time with cyanide was 14.2 seconds. On the following day under quiet circumstances the venous pressure was 14 cm. of water.

*Course.*—On the first day the patient was given 1 cc. of mercupurin and 10 mg. of thiamine parenterally; the next six days he received 50 mg. of thiamine daily. Niacinamide 150 mg. was also given daily. The diet was high in calories, proteins and vitamins. On this regimen the edema gradually receded. His weight dropped from 159 pounds (72 Kg.) on the third day to 136½ pounds (62 Kg.) on the thirteenth day. On the fourteenth day the total serum protein content was 8.44 Gm. with albumin 5.05 Gm. and globulin 3.39 Gm. per hundred cubic centimeters. After being up and around the ward for two days, edema free, the patient was discharged. Two weeks later he was seen in the medical clinic (blood pressure 144/80) in good condition, but he did not keep a return appointment.

In February 1945, three years later, he appeared in the receiving ward inebriated and nervous. He was given paraldehyde and sent home.

CASE 5.—*History.*—J. K., a Negro aged 47, admitted to the hospital on March 19, 1942, complained of shortness of breath. Previous hospital admissions were related to bilateral detached retinas. In 1937 the blood pressure was recorded as 130/85.

On the present admission he dated his illness from a cold in the head and a cough which began some ten days before. This was accompanied by increasing dyspnea and orthopnea and progressive dependent edema which finally rose to involve the wall of the chest, the neck and the face. There had been some tightness in the chest and little sputum and a subjective sensation of moderate fever at the onset of the illness. He denied all symptoms of previous cardiovascular disease. He had lived alone for years, almost blind, supported poorly by charity. *His diet could not be readily evaluated but was apparently* rather high in carbohydrate and deficient in niacin and thiamine. He had been treated for syphilis some years before and had had gonorrhea in his youth.

*Physical Examination.*—The temperature was 98 F., pulse rate 108, respiratory rate 24 and blood pressure 164/100. The patient showed considerable anasarca. He was orthopneic but seemed alert. There were well demarcated areas of scaly pigmented skin over the ankles, the pellagrous nature of which was disputed by competent observers. The follicular pigmentation of the legs was suggestive of scurvy. There was thought to be some fluid in the thorax, and a few fine moist rales were heard at the bases of both lungs. The heart was enlarged to the left, the apical impulse was 12.5 cm. to the left of the midsternal line. At times there were frequent extrasystoles, but the rhythm was usually regular. A soft systolic murmur which was present at the apex on admission disappeared shortly. The pulmonic second sound was accentuated and louder than the aortic second sound. There was no bounding of the pulses. The liver was engorged and fluid was noted in the abdomen. There was decided hyperesthesia of the soles, mild tenderness of the calves and absence of the ankle jerks.

*Laboratory Examination.*—Venous pressure was 15 cm. of water. The vital capacity was 56 per cent. Circulation times measured on the third day with cyanide and ether were 13 seconds and 7 seconds respectively. The urea nitrogen content of the blood on admission, which was 57 mg., soon fell to 21 mg. per hundred cubic centimeters. The count of red blood cells was 3.2 million, the hemoglobin content 11 Gm., the white blood cells 9,000. There was albuminuria (1 plus) the first two weeks but no other urinary abnormalities. The total protein content of the blood was 5.79 Gm. with an albumin to globulin ratio of 2 to 1. Reaction to the Kahn test was negative. Electrocardiograms on the second, fourth and fifth days showed auricular fibrillation, low voltage, T waves inverted $T_{1,4}$ and low voltage $QRS_{1,2,3}$. An x-ray of the heart was not made at admission.

*Course.*—The patient was given digitalis, an amount considered sufficient for digitalization in three days and continued on 1½ grains (0.1 Gm.) daily through the twenty-first day. Ammonium chloride was given for two days and in addition mercupurin and aminophylline. Symptoms under this management were progressive. On the fourth day observers noted an alteration in physical findings. There was a capillary pulse with pistol shot sounds over the femoral arteries. The blood pressure was 146/88. His weight was unchanged since admission (185 pounds or 83.9 Kg.). An x-ray of the heart showed the transverse diameter to be 13.5 cm. in a chest of 29 cm. At this time treatment with thiamine 50 mg. parenterally was begun and continued through the twenty-second day. Daily weights from this time showed a consistent fall presumably due to water loss: first week, 17 pounds (7.7 Kg.); second week, 23 pounds (10.4 Kg.). He finally maintained a weight of 135 pounds (16 Kg.). After a week of thiamine administration most of the pitting edema was gone. The liver was of normal size. The venous pressure was 8 cm. of water. Circulation times measured with ether and cyanide were 5 and 14 seconds respectively. Blood pressure varied between 180/96 and 130/80. The pulse rate gradually became slower, 76 to 96 being the extremes in the second week. The electrocardiogram showed restoration of normal rhythm, low voltage and a P-R interval of 0.20 second.

On the twenty-first day a cerebral thrombosis resulted in a hemiplegia of the left side. The patient survived this and improved gradually. Shortly before he was sent to the Chronic Disease Hospital on May 18, 1942 an electrocardiogram showed sinus mechanism, a P-R interval of 0.20 second and low voltage $T_{1,2,4}$.

Two and one-half years later on Oct. 25, 1944 a follow-up study showed the hemiparesis of the left side persistent, moderate evidence of peripheral neuritis and a normal electrocardiogram except for a slightly prolonged PR interval. The heart was 2 cm. smaller, the transverse diameter measuring 12 cm.

CASE 6.—*History.*—M. D., a white woman aged 56, came to the hospital May 30, 1940 complaining of dyspnea, edema of the ankles and weakness.

Three weeks earlier she noted the onset of some shortness of breath while walking. This progressed and was followed shortly by swelling of the ankles. The swelling too increased, rising to the thighs, abdomen and chest and finally involving her face. Aching pain appeared in the upper quadrant of the abdomen on the right side, and there was some aching in all four extremities. Because of weakness and dyspnea she took to bed but had to be propped up by several pillows. There was one episode of sensation of precordial pressure. There was no past history relevant to cardiovascular or renal disease.

She had drunk heavily of beer for many years, and this had interfered considerably with the intake of food. In the past year she had included little else than beer in her dietary.

*Physical Examination.*—The temperature was 100.2 F., pulse rate 96, respiratory rate 28 and blood pressure 130/70. The patient was pale and appeared acutely ill. There were anasarca, ascites and bilateral hydrothorax. The edges of the tongue were smooth as the result of papillary atrophy. The gums were soft and bled readily. The veins in the neck were distended. Moist rales were heard throughout the chest. The heart beat was regular except for occasional premature contractions. The heart was enlarged to both the right and the left. There was a soft apical systolic murmur. This disappeared by the next day. The palpable peripheral vessels appeared normal. The liver was enlarged and tender. Peripheral neuritis was readily demonstrated in the feet and legs. The extremities were warm, and pulses of the dorsalis pedis artery were palpable. On admission her weight was 138 pounds (62.6 Kg.).

*Laboratory Examination.*—There was a macrocytic anemia with a hemoglobin content of 11 Gm. per hundred cubic centimeters and a red blood cell count of 2.3 million. Urinalysis revealed no abnormalities. An electrocardiogram showed only low voltage. The urea nitrogen content of the blood was 13 mg. per hundred cubic centimeters. The Kahn reaction was negative. The serum protein content was 6.4 Gm. per hundred cubic centimeters, albumin 3.1 Gm. and globulin 3.3 Gm. There was free hydrochloric acid in the gastric contents. An admission x-ray of the heart was not made.

*Course.*—The patient was given a diet calculated to be low in vitamin B complex. She was allowed salt and fluids to the extent desired. At the end of two and a half days without medication her condition was unchanged. At this time she was started on a course of parenteral thiamine 50 mg. daily and continued for nine days. In a week she had lost 21 pounds (9.5 Kg.) of water and improved appreciably. In the midst of this course of thiamine on her ninth day in the hospital, a teleroentgenogram showed the transverse diameter of her heart to be 14 cm. After nine days of thiamine administration she was given a good diet and continued improvement. Dating from the time of entry in the hospital there was a spontaneous moderate reticulocytosis and, without the aid of liver, the blood picture slowly approached normal after cardiac compensation had occurred. On the twenty-sixth day in the hospital an x-ray showed the greatest width of the heart to be 12.0 cm. The patient was discharged on her thirtieth day of hospitalization. Four months later her anemia was again moderately severe and her diet poor. The blood pressure was 115/65. No evidence of heart failure was found. An x-ray showed the transverse diameter of the heart to be 11.5 cm. Treatment with liver extract resulted in complete clearing of her anemia. A year later she was well and showed no evidence of heart disease.

CASE 7.—*History.*—J. D., a man aged 54, Scottish, was admitted to the hospital on Feb. 18, 1944 complaining of swelling of the feet and legs which had persisted for three weeks.

On hospitalization in 1936 the diagnoses had been cirrhosis of the liver and chronic alcoholism. At that time the patient complained of dyspnea and edema. He showed some vasomotor flushing, blood pressure 140/60 to 152/60, a heart with its greatest transverse diameter (by x-ray) 13.5 cm., a diastolic gallop and a systolic apical murmur which disappeared after a day; rales at the bases of the lungs, an enlarged, tender liver, and edema and ascites. An electrocardiogram showed tachycardia and low voltage of all complexes. The patient was given digitalis for five days only. In twelve days on a routine hospital diet he was well, there were no residual pathologic conditions.

At the present admission he told of edema of the ankles and shortness of breath, which began three weeks before. Although he quit work and rested, the edema and dyspnea progressed. There was no orthopnea. During this interval he noted a decrease in the volume of urine, accompanied by frequency.

As a bartender and janitor he had continued to drink heavily since 1936. A review of his dietary secured in restaurants showed it was fair in thiamine and *poor in niacin, riboflavin,* ascorbic acid and vitamin A. Protein and calories were *adequately supplied.*

*Physical Examination.*—The temperature was 97 F., pulse rate 114, respiratory rate 24 and the blood pressure 96/50 to 110/50. Although able to lie flat, he showed moderate dyspnea. The face was flushed. Along the edges of the reddened tongue the papillae were atrophied. There was generalized soft, mobile edema and ascites. The pulse was *full but not bounding.* The greatest transverse diameter of the heart was 14.5 cm. in a chest of 27.5 cm. (by x-ray). There was tachycardia, with regular rhythm. Over the aortic area there was a systolic murmur, there was also a diastolic gallop; the aortic second sound was greater than the pulmonic second sound. The liver seemed moderately enlarged. Reflexes were hypoactive and were absent at the ankles. The mild sensory changes suggested disease of the cord resembling posterolateral sclerosis in the opinion of the neurologist.

The weight of the patient on the third day was 149½ pounds (68 Kg.) after he had lost considerable edema. On the fifth day the venous pressure was 21 cm. of water and the circulation time with dehydrocholic acid was 13 seconds. Serum proteins measured repeatedly, were in the range of 4.77 to 5.29 Gm. per hundred cubic centimeters, with an albumin-globulin ratio of 1 to 6, red blood cells numbered 3.18 million, the hemoglobin content was 11.5 Gm. and the white blood cells numbered 10,000. The urine showed a trace of albumin, a trace of sugar and a few white cells. Repeated urinalyses in the first four weeks showed sugar. An electrocardiogram, although showing low voltage notched QRS complexes, was thought fairly normal.

*Course.*—For most of the hospital stay the patient received supplemental amino acids. During the first week there was little alteration in his condition. At the end of this time venous pressure was still elevated and circulation time fast. The blood pressure was 120/60. Tachycardia increased in the second week when the patient was febrile, this was attributed to pleuritis. At the end of the second week when he had lost about 10 pounds (4.5 Kg.) of edema fluid (weight 139½ pounds, 63 Kg.), a course of thiamine was begun which ranged from 20 to 150 mg. a day given parenterally. In the following week the patient lost 24½ pounds (11 Kg.) of edema fluid. He was comfortable and edema free. The transverse diameter of the heart had decreased 2 cm. to 12 cm. The liver was no longer enlarged. The serum proteins had risen to between 5.9 and 6.6 Gm. per hundred cubic centimeters. The blood pressure rose to the range of 150/95 for several weeks but in the fifth and sixth weeks fell to 120/75 and 130/75. Various clinical tests revealed poor or retarded intestinal absorption accompanying achlorhydria and a low renal threshold for sugar. (The results of tests for liver function were controversial.)

He was discharged on the fifty-third day in good health except for the neurologic alterations. No digitalis was given throughout his hospital stay. On Sept. 12, 1945 he returned to the hospital again with beriberi heart disease and scurvy. The treatment and course were similar to the 1944 admission and he was discharged twenty one days later in good condition.

CASE 8.—*History.*—G. B., a white man aged 67, was brought to the hospital on May 26, 1944 from a boarding house where he had been living on an old age pension. He was known as a chronic alcoholic addict, drinking ½ pint of whisky daily in addition to beer. He was confused and unable to give a history.

*Physical Examination.*—The temperature was 98° F., pulse rate 96, respiratory rate 32 and blood pressure 138/108.

The patient was well developed and obese, appearing acutely and chronically ill. There was acute pellagrous erythema over the arms, hands and legs, scrotum and perineum, there was purpura about the ankles. A diffuse ecchymosis was noted in the paraumbilical region in addition to an acute cheilosis and severe injection of the bulbar and tarsal conjunctivas. The edges of the tongue were smooth but not red. The gums were dirty and ulcerated but not scorbutic. Anasarca was pronounced. The heart was enlarged. The sounds were feeble. There were no murmurs but a gallop rhythm was noted. Pulses of the dorsalis pedis artery were not felt. There were no capillary pulses. Respirations were periodic. There were signs of fluid at the bases of both lungs and above these areas were fine rales. The liver was thought to be somewhat enlarged. The usual deep reflexes were normally active.

A roentgenogram showed definite enlargement of the heart which could not be measured, since the lower part of the silhouette was obscured by pleural fluid. The serum protein content was 5.29 Gm. per hundred cubic centimeters. An electrocardiogram showed a rate of 90, sinus rhythm with a PR interval of 0.20 second and a QRS of 0.16 second. The $T_1$ was inverted, the T diphasic. There was a bundle branch block on the left side. The hemoglobin content of the blood was 14 Gm. per hundred cubic centimeters, red blood cells 5.12 million, white blood cells 7,200. Urinalysis gave normal results. Serologic reaction to the Kahn test was 3 plus, urea nitrogen measured 48 mg. per hundred cubic centimeters. Cerebrospinal fluid was normal. The icterus index was 25. Circulation time (with dehydrocholic acid) was 52 seconds, a questionable determination. Venous pressure was 12.5 cm. of water.

*Course.*—The patient was given nicotinamide 200 mg. every four hours and 100 mg. of thiamine both parenterally, daily. The pellagrous erythema cleared rapidly. Periodic breathing continued. He died slowly on the second day of hospitalization.

CASE 9.—*History.*—J. B., a white man aged 39, who entered the hospital June 12, 1944 had been a heavy beer drinker for twelve years and ate little. For three weeks he had noticed nervousness, visual hallucinations, anorexia and jaundice. For two weeks his abdomen had been swelling, and this was followed by swelling of the scrotum. For a week he had had a nonproductive cough and was short of breath. His stools had been frequent (three to four a day) for two weeks and they became watery and black a day or so before admission. For three weeks he had lived on beer, tomatoes and cantaloups.

*Physical Examination.*—The temperature was 99° F., pulse rate 100, respiratory rate 24, blood pressure 110/70 and weight 229 pounds (104 Kg.).

He was fairly well developed and moderately jaundiced. There were numerous spider angiomas on the face, chest, back and upper portion of the abdomen. Palmar erythema was moderate. Over the elbows was a chronic pellagrous dermatitis. On the arms and legs the hair follicles were hyperkeratotic. There was anasarca, and the abdomen was tense with ascites. Ecchymoses spread through the skin on the right side of the body. The tongue was red at the tip and edges. There was moderate cheilitis and congestion of the conjunctival vessels. The veins of the neck were distended. One observer thought that the peripheral pulses were bounding, another thought them soft and regular. There were a few wheezes and rales at the bases of the lungs. The heart was enlarged; a teleoroentgenogram gave the greatest transverse diameter as 18.5 cm. in a chest of 31 cm. and revealed some pulmonary congestion. The cardiac rhythm was regular, with no murmurs or gallop rhythm. The liver was decidedly enlarged and smooth. Deep reflexes were present. The extremities were warm.

*Laboratory Examination.*—The circulation time of the blood (with dehydrocholic acid) was 13 seconds, and the venous pressure was 15 cm. of water. There was no anemia, the count of white blood cells was 14,700. Urinalysis showed a trace of albumin and of urobilinogen. The stool was black, liquid and tarry and the guaiac test gave a 4 plus reaction.

*Electrocardiogram.*—There was a sinus rhythm, with a rate of 90, a PR interval of 0.20 second, a QRS of 0.08 second and low voltage. The T wave had low voltage in all leads. The QT interval was prolonged. Serum protein measured 5.53 Gm. per hundred cubic centimeters. The Kahn reaction of the blood was negative. The icterus index was 80 on the first day and 100 on the third. The prothrombin clotting time was 51 seconds. The cephalin cholesterol flocculation test gave a 4 plus reading in twenty-four hours. The urea nitrogen of the blood measured 10 mg. per hundred cubic centimeters on the first day and 47 mg. on the second.

*Course.*—In addition to paraldehyde for his restlessness the patient was given 50 mg. of thiamine and 100 mg. of nicotinamide intravenously daily. Vitamin K was given intramuscularly daily. He did not improve. Death occurred suddenly following an attack of vomiting.

CASE 10.—*History.*—J. B., a white man aged 53, a bachelor, came to the hospital on Jan. 26, 1944 because of "swelling of the privates" of a week's duration.

In the past year the patient had noted some gradually increasing dyspnea on climbing the 105 steps to his home. About twelve months prior to admission he had had edema of the ankles which responded to rest in bed. In the past ten days he had observed the progressive swelling of his body tissue which began in the ankles and spread upward, finally involving the abdomen, thorax and arms.

The only possible relevant past history was that of painful and swollen knees. This rheumatism had occurred in 1924 and lasted three days.

He was accustomed to drinking about 2 quarts of beer a day and supplemented this with wine. He earned $20 a week and lived with his mother and two brothers on a boarding house plan but frequently ate meals at a restaurant. The dietary history, taken and evaluated by an experienced dietitian, was considered unreliable but listed his dietary as poor in all members of the vitamin B complex and in vitamin C and fair in vitamin A, iron, phosphorus and protein.

*Physical Examination.*—The temperature was 101.8° F., pulse rate 108, respiratory rate 28 and blood pressure 142/60. There was extensive soft edema, present even in the wall of the chest and in the arms. The skin was warm however and there was an erythema of the legs extending to the knees, this area blanched on pressure. The veins of the neck were distended. Moist rales were heard at the lung bases and the diaphragm appeared to be elevated. By percussion the heart did not seem enlarged. The rhythm was regular. There was a soft systolic murmur heard over the sternum. The pulses were bounding, and pistol shot sounds could be heard not only over the femoral but also over the dorsalis pedis arteries. The abdomen contained free fluid; the liver was moderately enlarged and tender. There was no tenderness of the calves, paresthesia or alteration of the deep reflexes.

*Laboratory Examination.*—The count of red blood cells was 3.68 million, the hemoglobin content was 10.0 Gm. per hundred cubic centimeters and the count of white blood cells was 20,700, an increase in the polymorphonuclear leukocytes. The urinalysis was normal. Serologic reaction to the Kahn test was negative. Serum protein measured 4.42 Gm. per hundred cubic centimeters. The urea nitrogen content of the blood was 61 mg. per hundred cubic centimeters.

On the first day of hospitalization, January 27, a teleoroentgenogram of the chest showed the greatest transverse diameter of the heart to be 15 cm. in a chest of 29 cm. and revealed some evidence of chronic passive congestion. An electrocardiogram showed all T waves of low voltage and a PR interval of 0.14 second.

*Course*—The patient was given a calculated digitalizing dose in three days along with ammonium chloride There was no improvement, and the temperature varied between 100 and 101 F On the third day the blood pressure was 180/80 venous pressure 17 5 cm of water and the circulation time with dehydrocholic acid was 13 seconds Fever and leukocytosis were attributed to bronchitis and bronchopneumonia

On the fifth day since there had been no response, the administration of digitalis was discontinued and a period of observation was begun The patient weighed 149½ pounds (68 Kg) The total protein content of the blood serum was 4 87 Gm per hundred cubic centimeters with an albumin globulin ratio of 2 42 to 2 45 Gm or 98 per cent At this time the temperature reached normal An electrocardiogram showed the effect of digitalis and a PR interval of 0.26 second. In the next few days, without medication, the patient's weight dropped from 149½ to 115 pounds (68 to 52 Kg) as he lost edema fluid rapidly The blood pressure varied between 185/75 and 135/65 The signs of fast circulation disappeared and the venous pressure reached normal limits The protein content of the serum rose rapidly to 6 16 Gm per hundred cubic centimeters The patient was placed on a maintenance dose of digitalis, but this was again discontinued at the time of discharge on February 21 At this time he was feeling well and able to be up and about without any discomfort Other studies made the day of his discharge showed the heart size to be 14 cm by teleoroentgenogram The electrocardiogram revealed a PR interval of 0.21 second, $T_1$ low voltage, $T_2$ dysphasic $T_3$ inverted The protein content of the serum measured 7 03 Gm per hundred cubic centimeters, with an albumin-globulin ratio of 4 05 to 2 98 Gm, or 1 36 per cent

The patient did not return to the heart clinic as instructed. The record reveals that on May 20, 1944 he was dead on arrival at the admitting ward

CASE 11—*History*—F K, a white man aged 48, was in the hospital in 1934 because of lobar pneumonia and delirium tremens In 1942 he began attendance at the heart clinic because of dyspnea and edema He showed only fair response to digitalis therapy Although he was given diuretics periodically, he was never quite free of dyspnea and orthopnea and frequently had edema Electrocardiograms were either normal or showed low voltage His blood pressure ranged between 135/60 and 172/86

On Nov 29, 1944 he was admitted because of increasing severity of his symptoms For a month he had had some twinges of pain of short duration below the left nipple associated with exertion For ten days his dyspnea had been extreme He had been a chronic alcoholic addict for many years His food was gleaned from the scraps and leftovers at a nearby saloon There was little meat in his dietary He had at times had aching in the legs and some numbness and tingling in the extremities

*Physical Examination*—The temperature was 99 F, pulse rate 118 respiratory rate 36 and blood pressure 140/70

He was orthopneic the skin was warm and perspiration was profuse He displayed considerable acne rosacea over the face The veins of the neck were moderately distended No signs of congestion were noted in the chest The heart was enlarged to the left. The rhythm was regular There was a systolic murmur at the apex, transmitted into the axilla A rough systolic murmur was heard at the base of the heart the pulmonic second sound was greater than the aortic second sound The walls of the radial vessels seemed thickened The pulses were bounding and the extremities warm. The liver was enlarged but could not be palpated. There was slight edema of the ankles The knee and ankle jerks were absent

*Laboratory Examination*—The hemoglobin content was 12 5 Gm per hundred cubic centimeters, red blood cells 3 88 million, white blood cells 11 750 The urine gave a 1 plus reaction for albumin The sedimentation rate of the blood was normal Tests for liver function were consistent, with moderate hepatic damage. Electrocardiograms were normal except for changes due to digitalis therapy A teleoroentgenogram of the chest on the third day showed the heart to measure 16 cm in a chest of 28.5 cm

*Course*—The patient was given digitalis in maintenance doses and a routine diet In twenty-four hours he was delirious, and he remained so for almost a week A tachycardia and low fever continued during this time. On the tenth day the circulation time was 15 seconds with dehydrocholic acid and the venous pressure was 20 cm of water His weight was 150 pounds (68 Kg) The peripheral pulses were still bounding, and pistol shot sounds were heard over the brachial and femoral arteries Within four days without additional therapy the signs of fast circulation had disappeared The venous pressure slowly returned to normal Only a soft systolic murmur remained The blood pressure varied considerably and was recorded at 140/85, 110/88 and 136/94 The pulmonic second sound remained accentuated The greatest cardiac diameter in a chest 30 cm in diameter was 16 cm on admission, 16 5 cm on the eighth day, 14 cm on the eighteenth and 13 cm on the thirty-seventh He was discharged on his forty second day in good condition. In the outpatient dispensary the administration of digitalis was discontinued and the patient was lost Twelve months later he was found in a mental institution with Korsakoff's psychosis There were no symptoms of heart disease.

CASE 12—*History*—C. B, a white man aged 33, was brought to the hospital on May 28, 1945 in a delirious state. He intimated that his legs had been swollen for about six months He was a chronic alcoholic addict, and nothing reliable concerning his diet or previous history could be learned The temperature was 98 6 F, pulse rate 130 and respiratory rate 32 The blood pressure was 130/60 with some question as to the true diastolic level The following day the blood pressure was 115/40 Hyperventilation was notable. There was partial internal ophthalmoplegia Pupillary reactions to light were sluggish. The left pupil measured 3 mm and the right 5 mm There was a bilateral purulent conjunctivitis Cheilosis was slight but definite The gums and tongue were normal except for moderate pallor Observers were not impressed by any increase in the size of the heart Its rhythm was normal There was a questionable systolic gallop A harsh systolic murmur at the aortic area transmitted up into the neck and a systolic thrill over the vessels of the neck and an absent aortic second sound suggested aortic stenosis The peripheral pulse was feeble in spite of the wide pulse pressure There was evidence of fluid in the right side of the chest The edge of the liver extended 2 to 3 cm. below the costal margin Edema involved all portions of the body except the face. There was acute pellagrous erythema over the elbows knees and feet, with secondarily infected excoriations The deep reflexes were absent and there was hyperesthesia to the stroke of an applicator on the legs The snout reflex was positive

*Laboratory Examination*—The hemoglobin content was 10.2 Gm per hundred cubic centimeters, red blood cells 3 61 million and white blood cells 10,150 Urinalysis revealed no abnormalities beyond a few white cells The urea nitrogen content of the blood was 22 mg per hundred cubic centimeters, the test for vitamin C was negative, reaction to the Kahn test was negative, the carbon dioxide content of the plasma was 36 volumes per cent. The plasma chloride content expressed as sodium chloride was 524 mg per hundred cubic centimeters the serum protein content was 5 04 Gm per hundred cubic centimeters Examination of the spinal fluid revealed no abnormalities The circulation time with dehydrocholic acid was 15 seconds The femoral venous pressure was 10 cm of water

*Course*—Although the patient's condition was critical it was not planned to administer thiamine immediately Hyperventilation increased respirations reaching 40 a minute The temperature rose to 102 F Restlessness and delirium were controlled by paraldehyde Twenty-five hours after admission the patient died suddenly

Pathologic diagnoses were pronounced pulmonary edema with pulmonary congestion, cardiac hypertrophy and dilatation with myocardial degeneration and fairly well defined edema, generalized edema, decided fatty infiltration of the liver, serous leptomeningitis, cerebral congestion with slight perivascular hemorrhage, slight cerebral edema

# DELAYED SERUM SICKNESS REACTION TO PENICILLIN

EVERETT J GORDON M D
Washington D C

Although of infrequent occurrence, reactions to penicillin therapy occur with sufficient intensity to warrant their study and investigation This report is concerned principally with the delayed serum sickness type of reaction which makes its appearance after the course of treatment has been completed

Penicillin, born into therapeutics amidst World War II, has only recently been released in sufficient volume to permit its general use among the civilian population As its use becomes even more extensive, reactions which are of relative rarity at present will of course be encountered more and more frequently, presenting diagnostic and therapeutic problems with which the clinician should be familiar

## INCIDENCE

One of the great factors which has led to the popular acclaim of penicillin is its relative lack of toxicity Unfavorable reactions of all types are infrequent, and a fatal reaction is yet to be recorded This lack of toxicity was emphasized as one of the chief characteristics of penicillin in the pioneer work of Florey and Jennings [1]

The incidence of the urticarial type of reaction to penicillin has been variously reported by different investigators Keefer [2] found urticarial reactions in 14, or 2 8 per cent, of 500 patients treated Lyons [3] found urticaria to be the commonest single complication, occurring in 12, or 5 7 per cent, of 209 patients treated for surgical infection Moore,[4] in a preliminary report on penicillin therapy of 1 418 patients with syphilis, noted only 8, or 0 56 per cent, reactions of the urticarial type and only 7 other types of cutaneous rashes attributed to the drug, none of which required interruption of treatment Stokes [5] also studying penicillin in the treatment of syphilis observed but 2, or 1.2 per cent, urticarial reactions among 182 patients treated

Throughout a period of twelve months of routine administration of penicillin to battle casualties in the evacuation hospital to which I was assigned during the Italian campaign, there were only 2 cases in which urticaria appeared with sufficient severity to warrant suspension of treatment Although supportive statistics are not available, the incidence of all urticarial reactions was definitely low, undoubtedly less than 1 per cent The incidence of the delayed type of reaction could not be ascertained as patients were quickly evacuated to base hospitals following initial surgery One such case that did occur during a period of relative inactivity is herewith reported

In a six month period in which penicillin was routinely given before and after surgery of war wounds in a 2,400 bed orthopedic service in a general hospital in the United States there was only 1 recorded case of a reaction of the delayed serum sickness type In addition there was 1 other case among the hospital personnel

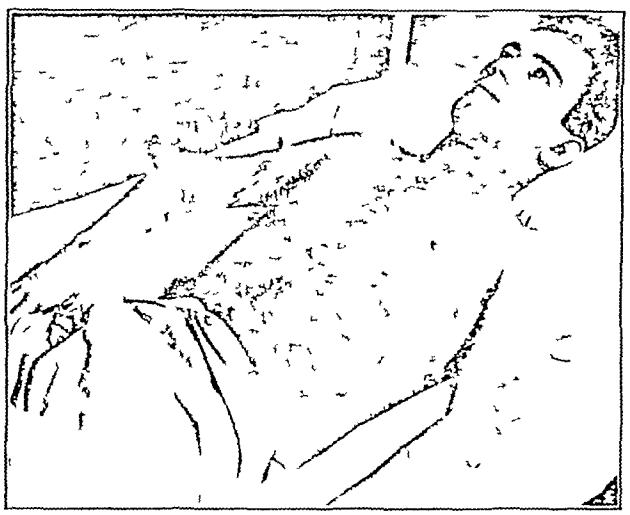
The incidence, then, of urticarial reactions occurring during the course of treatment is not frequent, the delayed serum sickness type of reaction occurs even more uncommonly, possibly once in 1,500 or 2,000 cases

## CASES FROM THE LITERATURE

A search of the *Quarterly Cumulative Index Medicus* and the Surgeon General's Index since the clinical introduction of penicillin in 1942 revealed a paucity of literature on this subject The following reported instances of delayed urticaria-like reactions to penicillin have been abstracted

In December 1943 Lyons [3] reported urticaria as usually developing during treatment but found that it may occur as late as nine days after the cessation of treatment He described the latter cases as showing a wide distribution of wheals over the body, swelling of the face and eyelids, swelling of the fingers and pains in the joints of the hands These changes persisted for three to five days independent of the continuation or cessation of treatment, although they were temporarily relieved by the use of epinephrine and ephedrine sulfate He further reported that subsequent courses of penicillin therapy in patients with a history of urticarial reaction during the first treatment period were uneventful and were not associated with recurrent urticaria. Lyons suggested that the symptoms were analogous to serum sickness but noted that neither eosinophils nor heterophil agglutinins were significantly or constantly increased in his patients Tests for cutaneous and ophthalmic sensitivity during and after reactive phases were negative.

An instance of allergy to penicillin was reported by Criep [6] in October 1944 following the administration of penicillin to a veteran aged 23 with chronic suppurative osteomyelitis of the right hip In this case the allergy was manifested as a massive generalized urticaria immediately following the administration of the first dose of penicillin after an interval of ten days following a fourteen day course of 200,000 units The reaction recurred with each subsequent injection of the drug until its administration was discontinued six days later There was no family or personal history of allergy



Barker [7] in February 1945 reported 1 case of contact dermatitis from direct handling of the product and a second of persistent urticaria in a wounded soldier treated with injections of penicillin for five days, with large confluent wheals on the trunk and extremities and with dermographism There had been no previous disease of the skin and no evidence of current fungous infection Intradermal cutaneous testing was positive in thirty minutes, persisting for twenty-four hours as an urticarial wheal

Morris and Downing [8] administered 1 million units of penicillin to a patient with postoperative infection, four days after the last injection the patient noted itching of the left arm and hand, followed twenty-four hours later by erythema and edema of the left side of the body and the left arm and hand The next day there was tense, pitting edema of the left hand and forearm, erythema, multiple ruptured and unruptured bullae filled with clear, thin, yellow fluid and multiple wheals on the left side of the face and trunk These manifestations persisted for four days

Sullens [9] recently reported that a white seaman aged 21 treated for acute gonorrheal urethritis with 100,000 units of penicillin in two separate courses twenty-three days apart, developed large urticarial wheals on the abdomen back and hips six days after the last course was completed followed later that day by arthralgia of the wrists and ankles moderate edema of the feet and hands, headache a slight elevation of temperature and moderately generalized lymphadenopathy The urticaria spread to the extremities, face and scalp in the ensuing three days and then gradually subsided over a six day period There was no effect from ephedrine but epinephrine gave transitory relief from the pruritus and urticaria Intradermal cutaneous tests showed a positive reaction to penicillin in five hours with negative reactions in 3 controls Sullens concluded that the patient was sensitive to something in the solution, either penicillin or an impurity

Macey and Hays [10] described 3 cases of delayed reaction varying in onset from two to five days after the last injection and characterized by an accelerated pulse rate slight elevation of temperature, edema of the face and hands and generalized giant urticarial lesions There was no dramatic response to the usual drugs such as epinephrine ephedrine and calcium compounds Macey and Hays believed that the reactions were due to a substance used in the preparation of the penicillin

Appearance of patient 2 with delayed serum sickness reaction to penicillin on third day (five days after last injection) Note urticaria of face arms and trunk, edema of upper eyelids and swelling of metacarpophalangeal joints of right hand

## REPORT OF CASES

Three cases of delayed reaction to penicillin are herewith reported The first case was originally reported in April 1945 in the Medical Bulletin of the Mediterranean Theater of Operations (restricted), but because of the limited distribution and availability of this publication it is again presented here in abstract form [11]

CASE 1—*A white soldier aged 23 was admitted to the* evacuation hospital on Feb 1, 1945 with pneumonia of the left hilar area His treatment included a course of penicillin of 25 000 units administered intramuscularly every three hours for five days, a total of 1 million units On the third day of treatment his temperature fell to normal and his symptoms cleared rapidly with a fairly smooth convalescence

Five days after the cessation of penicillin therapy he complained of the sudden onset of itching hives on his arms and legs soon spreading to his trunk Investigaton revealed no unusual contact such as clothes or soap and no deviation from the ward diet The family and personal history was negative for allergy All *medication* had been suspended two days before the onset of symptoms

The following morning the urticaria had spread to involve the face the entire trunk and all four extremities, despite treatment with ephedrine sulfate, intravenous injections of calcium gluconate and epinephrine in tablet (hypodermic) form On the second day of the reaction the patient complained of swelling and persistent aching pain in the phalangeal and metacarpophalangeal joints of both hands and in the joints of both ankles Examination revealed a pitting type of edema local warmth tenderness and painful motion of the affected joints the pulse rate and temperature were slightly elevated

Treatment hypodermically with epinephrine hydrochloride 1 1000 solution was followed by a sharp decrease in the generalized pruritus and mild blanching of the *erythematous* areas but the relief was only transitory In administering this drug it was noted at the time that there was little relief or disturbance from the use of the tablet form of epinephrine, which apparently had deteriorated, whereas injection of the epinephrine hydrochloride solution not only relieved the symptoms of the reaction but also caused appreciable precordial distress and increased nervousness including hand tremors Substitution of epinephrine hydrochloride in peanut oil gave much more satisfactory and prolonged relief

Urticaria persisted for three days but the swelling and soreness of the hands and ankles did not disappear until the seventh day of the reaction on this day an exfoliative type of dermatitis appeared on the palms of both hands lasting three additional days

CASE 2—A white soldier aged 23 was admitted to this hospital as an overseas evacuee from the European theater for further treatment of a compound fracture of the right elbow sustained when the bomber in which he was flying was struck on April 2 1945 by fragmentation bombs accidentally released by an American plane overhead After initial treatment overseas in which he received 2 million units of penicillin he was evacuated to the United States for further care A resection of the right elbow joint was performed on Oct 23 1945 under gas ether oxygen anesthesia following which penicillin was administered a routine measure after surgery on previously compounded fractures He received 25 000 units every three hours intramuscularly for nine days during which time his temperature and pulse remained within normal limits

Two days after the cessation of this course of penicillin, while at home on a week-end pass he noted a small patch of hives first on the left arm but soon followed by extension to the other arm and to the trunk face and back Within a few hours he noted pains in the joints in both hands and both feet. The following day there was *fleeting* pain in both knees not severe the pain in the left hand had subsided somewhat. He returned to the hospital at which time examination revealed generalized urticaria and decided swelling of the fingers of the right hand including the metacarpophalangeal joints there was also swelling of the toes and metatarsophalangeal joints of both feet, more pronounced on the right

The accompanying picture was taken on the third day when the lesions were most intense however the patient had received 0 5 cc of epinephrine hydrochloride a half-hour before reducing the size of the wheals and edema

Symptoms persisted for three days in an intense form despite the use of epinephrine hydrochloride during this time there was pronounced edema with almost complete closure of both eyes The edema of the right foot persisted for several days after other symptoms had subsided a similar condition persisted in the right hand but the recent surgical intervention in the right elbow clouded the mechanism of its production Five days after the onset of the reaction all swelling of the toes and fingers had entirely cleared and the urticaria had not reappeared however an exfoliative dermatitis of both palms had appeared on the third day and this was still present along with a mild generalized pruritus No signs or symptoms were present by the eighth day of the reaction

11 Gordon E J Serum Sickness Reaction to Penicillin A Case Report M Bull Mediterranean Theat. Op 3 123 (April) 1945

On questioning, the patient gave no history of asthma, hay fever or other allergies either in himself or in his family. The only other course of penicillin he had received was that given immediately after his injury.

CASE 3.—A girl aged 20, a member of the Women's Army Corps, was readmitted to the hospital in the dermatologic service with severe generalized urticaria which involved all the extremities and the trunk but not the face and was of obscure etiology. She stated that she had been discharged from the hospital seven days before after having been hospitalized ten days for acute follicular tonsillitis. During her previous hospitalization she had received a course of penicillin therapy of 25 000 units every three hours, administered intramuscularly, for a total of 1 600 000 units.

While at home seven days after the last injection of penicillin she first noted a severe urticaria of her trunk, rapidly followed by extension to all four extremities. It increased in severity despite the use of ephedrine sulfate. The following day she noted aching pain in both knees and ankles accompanied by mild swelling. She returned to the hospital where a careful search for possible allergic sensitivities was made including multiple scratch and intradermal tests. The history of recent penicillin therapy was disregarded.

The urticaria cleared three days after its onset, but the pains in the joints persisted in a mild form for an additional week. Seven days after the onset an exfoliative dermatitis of the palms of both hands appeared and this persisted one week. Ten days after the onset the reaction had subsided except for the slight persistence of mild pain in the joints in both knees and mild exfoliation of both palms.

The patient gave no history of previous allergy either personal or within the family. She had never received any penicillin before.

### COMMENT

In these 3 cases there have been certain similarities in the manifestation of the reaction attributed to penicillin. In each case the appearance of the reaction was delayed several days varying from two to seven, following cessation of penicillin therapy. The first appearance in each was an intense urticaria with severe pruritus and wheal formation appearing on one portion of the body either the trunk or the extremities but rapidly extending to involve most of the remaining cutaneous area. In 2 of the 3 cases there was edema of both eyelids, causing almost complete closure. Secondly, pain in the joints accompanied by swelling, tenderness, local warmth and painful function were manifested in each case. Malaise with mild fever and tachycardia were also present at this time. A third feature which was present in all 3 cases in the latter stages of the reaction was an exfoliative dermatitis of both palms, whether or not this was coincidental or an integral part of the reaction could not be determined but it was present and was the last manifestation to disappear in each case.

The urticaria responded to treatment with epinephrine hydrochloride administered hypodermically, but it recurred repeatedly and ran a course of approximately seventy-two hours.

None of the 3 patients had had any previous manifestations of allergy in any form, nor were there any other agents to which the urticaria could be attributed.

The characteristic features of this type of reaction appear to be (1) delayed appearance following the cessation of penicillin therapy, (2) intense, severe urticaria, rapidly extending to become generalized, (3) multiple involvement of the joints, large and small, with serous effusion and intense arthralgia, (4) severe malaise, mild fever and mild to moderate tachycardia, (5) exfoliative dermatitis of both palms in the terminal stages as the urticaria fades and (6) a self-limited course of seven to ten days irrespective of the therapy employed.

Such a composite picture strongly resembles that of serum sickness of the type usually associated with delayed reactions to biologic products such as liver extract, insulin and posterior pituitary injection.

### ETIOLOGIC CONSIDERATIONS

The mechanism of the production of delayed reactions to penicillin is still a subject of investigation.

Barker[2] and Lyons[3] believed that untoward reactions were due to impurities in the preparation of the drug rather than to the active penicillin fraction, the latter investigator found such impurities to constitute 80 to 90 per cent of the final product (in 1943) and to vary from batch to batch even in the hands of a single producer. This percentage has since been greatly reduced as the manufacturers have developed finer processes of culture and extraction which, as at present utilized, result in a content of penicillin varying between 20 and 40 per cent. The remaining material consists of extractives soluble in organic solvents which occasionally produce urticaria and vary in different batches.

The tendency to ascribe reactions to impurities in the preparation and not to the penicillin fraction itself is further observed in the usual current practice of changing to another manufacturer's brands when a reaction occurs with the product of one.

Although undoubtedly there has been good reason to believe that some of the reactions have been a direct result of toxic impurities, evidence is rapidly accumulating to prove that penicillin in itself is a sensitizing agent capable of producing an allergic state in susceptible individuals.

Pyle and Rattner[12] found no reaction from patch tests with the medium (corn steep liquor and lactose) but strongly positive tests with the whole product and slightly positive reactions with the crystalline product, the purest penicillin available. They concluded that the dermatitis was due to the penicillin itself and not to the medium as proposed by Barker and Lyons.

Criep[6] performed several immunologic studies on his patient. Direct cutaneous tests showed the patient to be hypersensitive to penicillin even in dilute concentrations where controls gave no reactions. Using the patient's serum, passive transfer tests yielded a positive reaction with penicillin in 1 1,000 dilution, controls being negative, however, Criep could not demonstrate anaphylactic antibodies to penicillin in the patient's serum. It was his opinion that there was evidence of the presence of some immune substances in the serum of his patient, such as reagins and precipitins, as proved by the positive direct skin test and positive passive transfer and precipitin tests, but he believed that their exact role was unknown. He concluded that the sensitivity was to penicillin and not to the medium, being an allergy similar to that to serums and drugs.

Another factor in this apparently allergic phenomenon is the part possibly played by sensitization by previous fungous infection such as tinea. The prevalence of "athlete's foot" among such a large proportion of the population could easily account for almost universal sensitization to fungous antigens. In both of the cases reported by Graves, Carpenter and Unangst[13] there were histories of fungous infection and sensitivity to trichophytin. In both cases there were recurrent vesicu-

lar eruptions occurring three and twenty-four hours after the first dose of penicillin

Using the Schultz-Dale technic in sensitized guinea pigs, Jadassohn (quoted by Graves, Carpenter and Unangst) proved that pathogenic fungi contain a specific antigen as well as another antigen common to all of them Could allergic reactions to penicillin, which is produced from a fungus, be attributed to such a fungus-antigen relationship? There is considerable doubt at present

Some of the most interesting and revealing laboratory studies on the sensitizing properties of penicillin were performed by McClosky and Smith [14] using two series of guinea pigs both sensitized by daily subcutaneous and intraperitoneal injections of penicillin over a five day period One group was used for intracardiac or intravenous injection of antigen after an adequate incubation period the other for tests on the isolated uterus by the Schultz-Dale technic Some of the animals in each group were also sensitized to horse serum to ascertain the extent of the anaphylactic state developed in the animals in the event the reactions to penicillin were negative Sensitization was not uniform and was usually atypical The positive reactions were also mostly atypical in that reactions (such as uterine response) were often delayed and desensitization was often ineffective This led to the opinion that the antibody-antigen combinations of commercial penicillin lack permanence and are more readily reversible than is the case in anaphylactic reactions following sensitization with true proteins

They concluded that anaphylactic sensitization in the susceptible guinea pig can be achieved with penicillin as it is currently prepared and marketed They used penicillin consisting of several commercial lots of the sodium salt manufactured by five different distributors, of the same degree of purity as that used in the clinic They could not state to what extent impurities alone were responsible, if responsible, then the impurities were inherent in the commercial products, in which they were inseparable from the active substance It was suggested that parallel experiments with synthetic penicillin when available would provide the answer

From this excellent laboratory study we have direct evidence that penicillin is capable of anaphylactic sensitization Unfortunately there have been few clinical studies in this direction possibly owing to the present relative infrequency of reactions to penicillin It is suggested that one might attempt desensitization to penicillin when a reaction is encountered and the use of the drug is imperative, in the same manner as that performed for tetanus antitoxin and gas gangrene antitoxin

Although, admittedly, corroborative experimental evidence is not yet conclusive it is my opinion that reactions to penicillin should be regarded as the manifestation of a sensitizing substance with allergic potency and should not be merely attributed to toxic impurities resulting from the commercial preparation of the drug • The problem should not be regarded as merely a matter of switching brands, but it should be approached in the same manner in which one would approach any other allergic condition The advent of penicillin in synthetic form will undoubtedly lead to further investigation and clarification of the present nebulous etiology of reactions to penicillin

14 McClosky W T and Smith M I. Experiments on the Sensitizing Properties of Penicillin Proc. Soc. Exper Biol & Med 57:270 (Nov.) 1944

SUMMARY AND CONCLUSIONS

A search of the literature revealed several reported cases of delayed reactions to penicillin of the type of urticaria and serum sickness

The incidence of delayed, serum sickness reaction to penicillin is low, although exact statistics are not available, the incidence is probably no greater than 1 1 500 or 1 2,000 cases of penicillin therapy

The characteristic features in 3 cases were (1) delay in appearance, (2) severe malaise, mild fever and moderately rapid pulse, (3) severe, intense spreading urticaria, (4) arthralgia with serous effusions of the joints, (5) exfoliative dermatitis of the palms of both hands, and (6) a self-limited course of seven to ten days regardless of the treatment used

Both the preponderance of opinion and the laboratory studies point to an anaphylactic sensitization by the penicillin fraction itself in susceptible individuals, with a resultant true allergic manifestation such as is found with sensitization to true proteins as the cause

The diagnosis of urticaria of obscure origin should always include the possibility of origin from a recently completed course of penicillin therapy

3700 Massachusetts Avenue N W

## FATAL ANAPHYLACTIC SHOCK

### Occurrence in Identical Twins Following Second Injection of Diphtheria Toxoid and Pertussis Antigen

JACOB WERNE M D and IRENE GARROW M D
New York

Deaths related to the injection of foreign protein in man are fortunately few The exact number of such occurrences is difficult to estimate from the available literature By 1942 Kojis [1] was able to find 61 such deaths, and he added 4 more from the Willard Parker Hospital The most complete and most recent study of necropsies was made by Vance and Strassmann,[2] who added 7 autopsy studies from the Office of the Chief Medical Examiner to 19 taken from the literature Park [3] in 1932 recorded the mortality from serum anaphylaxis as 0 002 per cent Kojis [1] in 1942 found it to be just under 0 1 per cent in a series of 6,211 subjects treated for various infections Rutstein and his associates,[4] in their analysis of pneumonia cases treated with antipneumococcus horse serum, found the mortality to be 0 45 per cent In only 1 or possibly 2 of the 25 deaths did they assign significance to protein hypersensitivity as a cause They state that all these persons who died had vascular collapse, that only 2 had asthmatic breathing and that only 1 had hives No characteristic change was noted in the 7 who came to autopsy other than the primary pneumonia from which all the patients suffered at the time of receiving the serum

The inadequacy of our present knowledge of the mechanism in deaths following the administration of

The photomicrographs were taken by Mr Julius Weber

Read in part before the New York Pathological Society Dec 27 1945

From the Office of the Chief Medical Examiner City of New York and the Pathology Department of St. John's Long Island City Hospital

foreign protein is evident from Kojis's [1] summary of the 24 necropsies among the 61 he found in the literature "3 showed nothing, 6, only an enlarged thymus, 1, subacute nephritis, 1 a dilated left ventricle, congested kidneys and a slightly enlarged and pulpy spleen, 7, the guinea pig type of anaphylactic death, 3, the canine type, 1 the rabbit type 1, a combination of the guinea pig and rabbit type, and 1, a combination of the guinea pig and canine types" It is evident that the interpretation of some published cases must remain in doubt because of the absence or incompleteness of pathologic study

The cases reported as exhibiting harmful effects from the administration of foreign proteins fall into two groups In one the reinjection of antigen appears to have induced the same state of susceptibility [5] as obtains in the experimental animal, in the other the development of sensitivity is considered spontaneous because it is unassociated with a history of prior parenteral injection

Coca and Cooke [6] considered the mechanism of natural sensitivity in atopic individuals as separate from the one which underlies experimental anaphylaxis Ratner and Gruehl [7] believed that the demonstration of transferable reagin in the blood of asthmatic persons and guinea pigs made such a distinction untenable. The possibility that some naturally sensitive individuals may have had previous contact with an antigen subsequently found capable of producing shock was suggested by the successful sensitization of guinea pigs to inhaled horse dander [8] Of the 65 cases summarized in Kojis's [1] review 16 gave a history of asthma or chronic respiratory disease, and 17 had injections from one day to ten years previously Vance and Strassmann [2] noted a striking resemblance between the asthmatic and the presumably nonasthmatic patients There was similarly no fundamental difference either in clinical symptomatology or in pathologic findings in those who had no history of prior parenteral injection

Although the symptoms and lesions of anaphylaxis are constant for a given animal species [9] irrespective of the antigen, available information discloses no such uniformity in the human being Conditions that surround the clinical occurrence of hypersensitive states in contrast with the experimental are far from standard Among the variables that explain the wide differences in the allergic responses observed clinically are dosage, route of absorption period in the development of sensitivity concurrent disease and individual predisposition Dependent on these various conditions and on the site of antigen antibody reaction we may see [10] the Arthus phenomenon urticaria eczema asthma hay fever, serum sickness periarteritis nodosa, food or drug idiosyncrasy, the 'tuberculin type' of reaction to microorganisms and their products, and sudden collapse and death

With the increasing use of immunotherapy, it is important that serious reactions be made known Where death has occurred, the postmortem investigation should consider (1) the possible primary toxicity of the product in the dosage used, (2) possible contamination of injection materials, (3) symptomatology and pathologic findings with special attention to the role of associated disease, and (4) possible demonstration of passively transferable reagin [11]

## REPORT OF CASES

On June 19, 1945 the death of identical [12] twins after a second injection of diphtheria toxoid and pertussis antigen, alum precipitated,[13] was reported for investigation

*History*—D M and G M., boys aged 10 months, were brought to St. John's Long Island City Hospital (service of Dr James M Dobbins) on June 19, 1945 at 7 15 a. m D M was pronounced dead on arrival, the condition of G M was described as critical He was cyanotic and dyspneic respirations were shallow, rapid and labored. Oxygen was given by mask., suction was applied for aspiration of mucus, 4 cc of nikethamide was given at 8 a. m., 3 minims (0 18 cc.) of epinephrine at 8 15 and 2 cc. of caffeine with sodium benzoate at 8 45 At this time the temperature was 99 F Cyanosis continued to be present at intervals One cc. of

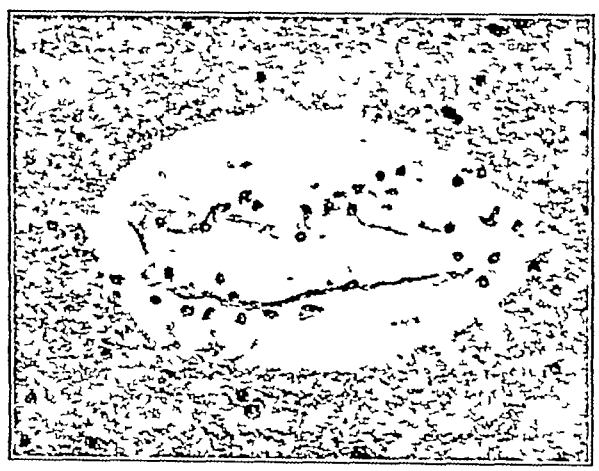

Fig 1 (D M)—Section of brain showing fibrin clot in vein perivascular edema and cellular infiltrate Hematoxylin and eosin Slightly reduced from a photomicrograph with a magnification of 300 diameters.

picrotoxin was given at 9 30, respirations were then noted as being 38. At 10 and 10 30 3 more minims of epinephrine were given, and at 10 45 infusion of plasma was begun Before 40 cc. was given the subject was pronounced dead.

The family physician stated that nothing untoward was noticed immediately after the injections except that I twin bled slightly from the site, necessitating the application of an additional cotton pledget. The parents stated that following the first injections one month before (from another ampule of the same product) D M vomited, had a temperature of 101 F and cried considerably One-half grain (0.032 Gm) of acetylsalicylic acid was given and by evening he was apparently well. G M remained symptom free after the first injection

After the second immunizing injections, both infants cried considerably on reaching home, they vomited and consumed excessive amounts of water, each taking about two full bottles They then 'fell asleep and when next noticed by their parents appeared 'lifeless" Their position in the cribs remained unchanged, and they could be aroused only by loud noises D M had a 'staring" expression, his temperature was 99 F

12 The physician in attendance at their birth stated that they had a common placenta.
13 The product of a reliable pharmaceutical manufacturing company whose name is withheld

At 11 30 p m, when his diaper was changed he was found to be ice cold and wringing wet with perspiration" The parents explained that they regarded these symptoms as expected effects of the injections and therefore did not summon medical aid until 5 30 a m, when D M appeared to be dead and G M gravely ill

Fig 2 (D M)—Section of heart showing paravascular mononuclear cellular infiltration Note the binucleated cell Hematoxylin and eosin Slightly reduced from a photomicrograph with a magnification of 275 diameters

The twins were born at eight months gestation, D M weighing 2 pounds 8 ounces (1,134 Gm) and G M 5 pounds 4 ounces (2 381 Gm) The former was placed in an incubator and developed normally Both continued in good health At 6 months they were vaccinated against smallpox

The mother had been inoculated against diphtheria as a child but did not receive any injections during pregnancy There is no history of allergy on her side of the family The father described a sudden swelling of the lower lip while in the Army which disappeared as precipitously as it came on After receiving his medical discharge he experienced another similar episode which was diagnosed as 'allergic' by a medical officer who happened to be present at the time

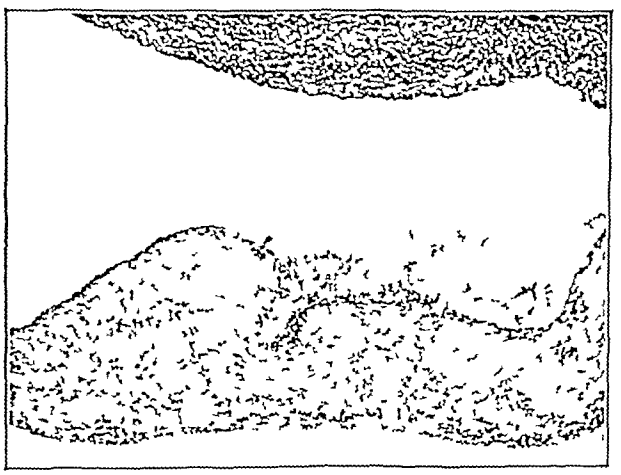

Fig 3 (D M)—Section of aortic valve showing endothelial swelling and increased cellularity of leaflet Hematoxylin and eosin Slightly reduced from a photomicrograph with a magnification of 60 diameters

*Postmortem Study*—At autopsy both twins[14] were well nourished and well developed The sites of recent inoculation in the deltoid region were marked by minute puncture wounds of the skin and a small amount of hemorrhage in the underlying fat There was no gross evidence of significant inflammatory reaction The brain in each case felt softer than usual The subarachnoid space contained excess fluid The meninges mastoids, middle ears and tonsils showed no evidence of infection. There was no regurgitation or aspiration of stomach contents The thymus of D M weighed 28 4 Gm and showed numerous petechiae, that of G M weighed 34 1 Gm The adrenals of D M weighed 3 0 Gm and those of G M 3.2 Gm., they showed no gross abnormalities The heart contained both clotted and fluid blood in each instance. There were epicardial and pleural petechiae The lungs were salmon pink and air containing for the most part In G M the parenchyma on section showed edema, in D M there were conspicuous focal hemorrhages in the dependent portions The mucosa of the larynx trachea and bronchi was pale and free of exudate. The bronchopulmonary lymph nodes were not enlarged The liver of D M weighed 350 Gm that of G M 370 Gm In D M it showed extreme congestion The spleen and kidneys were moderately congested The gastrointestinal tract showed no gross lesions The lymphatic follicles were normally conspicuous as were the mesenteric nodes The pancreas, biliary passages and genital organs were natural There were no skeletal abnormalities Postmortem lung cultures were made and found sterile in each instance, and in addition a sterile postmortem culture was obtained from the spleen of D M

Postmortem serum was tested on four members of the laboratory staff for the presence of reagin after the prior

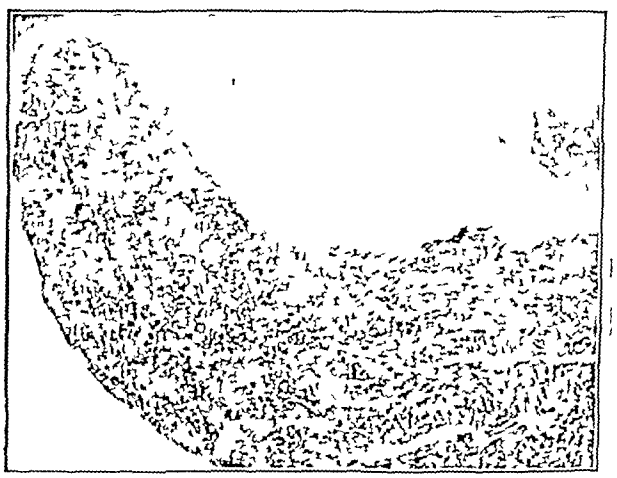

Fig 4 (C M)—Section of cardiac papillary muscle showing necrosis and hemorrhage Hematoxylin and eosin Slightly reduced from a photomicrograph with a magnification of 80 diameters

intracutaneous injection of the biologic product, with negative results[15] This contrasts with the success of Lund and Hunt[11] in eliciting a Prausnitz-Kustner reaction for the first time with postmortem serum It is noteworthy in this connection that negative reaction to passive transfer was also recorded by Walzer[16] in a case of shock following injection of horse serum The attempt[17] to effect passive transfer from postmortem serum in these cases to guinea pigs was also unsuccessful

The contents of the vial used in immunizing the twins, and of the vials bearing the same lot number submitted by the manufacturer, were examined by Dr Jules Freund of the Bureau of Laboratories, Department of Health, City of New York and the following results were obtained The vaccine was found to be sterile that is, the sterility test required by the National Institute of Health for biological products was satisfactory The microscopic picture showed formed elements of the size and shape and staining qualities of Bordet Gengou bacilli Tests carried out on the skin of rabbits showed that there was no free diphtheria toxin in the vaccine The identity test showed that the vaccine contained diphtheria toxoid, that is, combined with the diphtheria antitoxin, 0 5 cc. amounts of the vaccine injected into the peritoneal cavities of white mice

14 Unless otherwise stated the pathologic descriptions apply to both subjects

15 Dr Bret Ratner examined the sites of injection in the 4 volunteers

17 Dr Jules Freund Bureau of Laboratories City of New York.

did not cause obvious toxic reactions (The latter test is routinely done on biologicals for harmlessness)'

The histopathologic study disclosed lesions consistent with death in anaphylactic shock. The skin at the site of inoculation (studied in G M) showed swelling and acute degeneration of collagen, arteriolar degenerative changes, thrombosis and hemorrhage Bacterial stains showed numerous forms resembling Hemophilus pertussis The follicles of the spleen, lymph nodes and gastrointestinal tract showed conspicuous macrophages containing abundant nuclear particles and cytoplasmic debris There were numerous eosinophils in the lymphatic tissues The thymus showed foci of hemorrhage and necrosis, and extremely constricted arteries whose walls showed edema, eosinophilia and endothelial swelling and proliferation

The brain showed capillovenous engorgement, perivascular hemorrhages, arteriolar narrowing and diffuse degenerative changes of some arterial walls, with cellular infiltration of the vessels and the surrounding space, this was mainly mononuclear with occasional polymorphonuclears and eosinophils Many nerve cells showed acute degenerative changes

Heart sections showed focal necrosis of muscle, more accentuated beneath the epicardium and endocardium Constricted lumens, edema and necrosis of some arterial walls were observed, as were swelling and some proliferation of the endothelium Perivascular hemorrhages were frequent in relation to such

Fig 5 (D M)—Hilus of lung showing macrophagocytic activity in lymph follicles constricted artery dilated veins and interstitial edema Hematoxylin and eosin Slightly reduced from a photograph with a magnification of 60 diameters

areas Sections of aortic and mitral cusps showed endothelial swelling and increased mononuclear cells throughout the leaflets

The respiratory epithelium showed excellent preservation with intact cilia (Fulminating respiratory infection the most common cause of unexpected death during infancy was thereby excluded[18]) Extreme narrowing of some bronchial and many arterial and arteriolar lumens was conspicuous Mononuclear, slight polynuclear and slight eosinophilic infiltration occurred in both bronchial and pulmonary arterial walls The pulmonary veins and alveolar septal capillaries were deeply engorged The lymphatics were dilated with abundant protein precipitate There were foci of pulmonary edema, both interstitial and intra alveolar, and foci of hemorrhage and early intra-alveolar exudate, mainly polymorphonuclear especially in the case of D M Fibrinous exudate and bacteria were not seen

The liver sections showed extensive parenchymatous degeneration, most evident in the central two thirds of the lobule, this took the form of granular and hydropic change, with pyknosis of nuclei and chromatolysis The sinusoids contained abundant leukocytes with a moderate number of eosinophils Occasional focal necrosis was seen mononuclears filling the parenchymatous defect, some multinucleated hepatic cells occurred in peripheral portions of some lobules

COMMENT

The widespread visceral lesions encountered seem adequate to explain the profound shock observed clinically The histological appearances point to acute vascular injury as the underlying cause This results from the basic physiological disturbances that seem

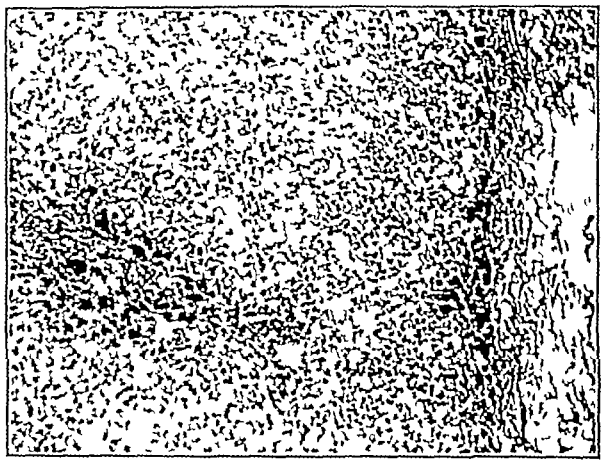

Fig 6 (D M)—Section of liver showing parenchymatous degeneration increased leukocytes in sinusoids and capsular edema. Note multinucleated hepatic cells Hematoxylin and eosin. Slightly reduced from a photomicrograph with a magnification of 60 diameters

adequate to explain the apparently diverse manifestations of the anaphylactic state contraction of smooth muscle and increased capillary permeability[19] The former, if severe enough in bronchiolar or pulmonary arteriolar muscle, is believed to cause death by asphyxia or dilatation of the right ventricle, as in the guinea pig[20] and the rabbit[21] respectively

In 14 of the 19 autopsies taken from the literature and in the 7 they added, Vance and Strassmann noted either a clinical history of dyspnea or the postmortem

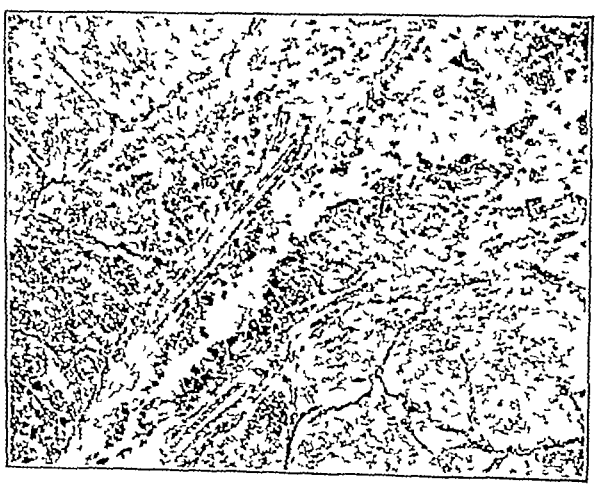

Fig 7 (D M)—Section of thymus showing constriction of artery hemorrhage and necrosis Reticulum stain Slightly reduced from a photomicrograph with a magnification of 40 diameters

finding of emphysema This they interpreted as indicating asphyxial death by bronchospasm In the cases

reported here there was neither clinical nor pathologic evidence for significant bronchial obstruction as a cause of death Increased capillary permeability, as emphasized by Manwaring and his associates [22] and by Moon,[23] among others, may lead to reversible shock, protracted shock or instantaneous death Collapse

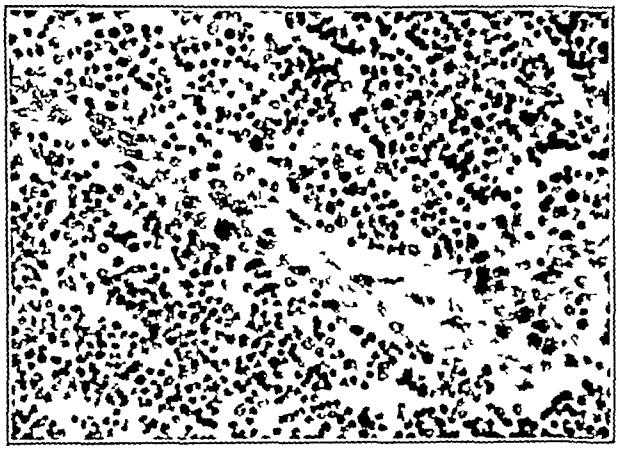

Fig 8 (D M)—Section of thymus showing vascular edema and eosinophilia Giemsa stain Slightly reduced from a photomicrograph with a magnification of 300 diameters

referable to this widespread vascular disturbance is the usual expression of anaphylaxis in the dog and was the conspicuous feature in the cases presented here With respect to the clinical appearance of shock, rather than respiratory difficulty, as with respect to some of the visceral lesions, particularly the hepatic, these cases recall the one reported by Dean,[24] in which death occurred seventy minutes after the fourth injection of tetanus antitoxin

The morphologic appearances are in accord with the direct observations of Abell and Schenck [25] in shocked

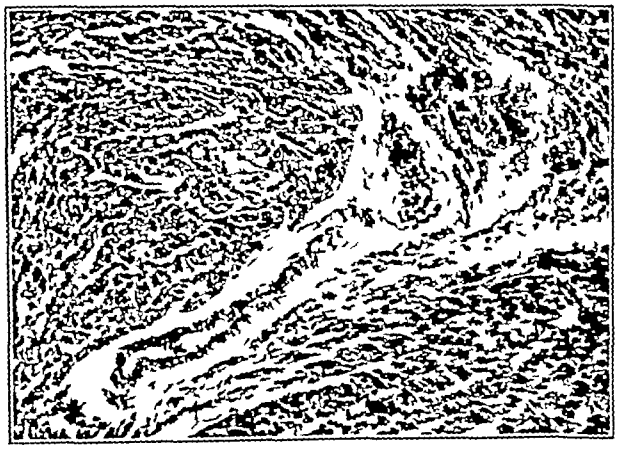

Fig 9 (G M)—Section of heart showing constriction of arterioles and focal hemorrhage Hematoxylin and eosin Slightly reduced from a photomicrograph with a magnification of 150 diameters

rabbits They describe arteriolar contraction with obliteration of lumens and margination and migration of leukocytes, which formed obstructive clumps, thereby stopping circulation Endothelial destruction with hemorrhage was seen in the most severe reactions McMaster [26] similarly observed vascular spasm as a local effect of the introduction of antigen in a previously sensitized mouse Arteriolar spasm has been emphasized by Ratner [27] as explaining the characteristic allergic phenomenon of wheal formation

The sixteen and twenty hour intervals elapsing between the shocking injection and death in the cases reported here contrast with the short interval in the majority of recorded instances In the 26 necropsies reviewed by Vance and Strassmann [2] only 5 of the patients lived from one to twenty-three hours

Waldbott [28] reported 3 cases of allergic shock in which the acute symptoms were followed by signs of bronchopneumonia Recovery occurred in 2 The third showed at autopsy congestion and edema of cerebral and meningeal blood vessels, few cerebellar petechiae, areas of solidification in both lungs, congestion and emphysema, on microscopic study, patchy bronchopneumonia, massive intra-alveolar hemorrhage and edema, necrosis of alveolar epithelium, and emphysema were noted In this case dyspnea, cough and

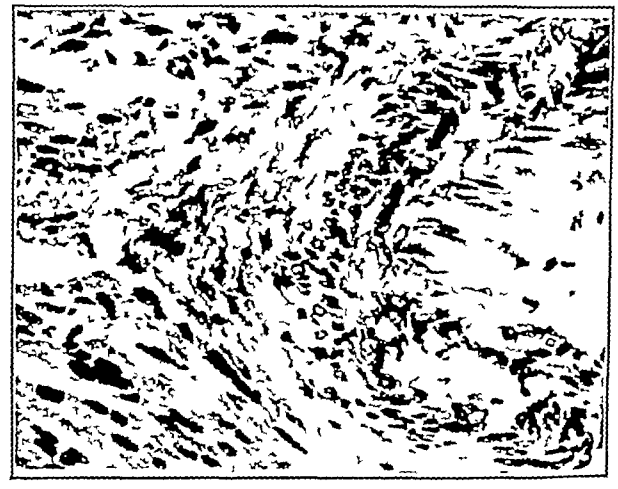

Fig 10 (D M)—Section of heart showing extreme narrowing and edema of arteriole Hematoxylin and eosin Slightly reduced from a photomicrograph with a magnification of 300 diameters

unconsciousness had developed four hours after the intravenous injection of typhoid vaccine, and death occurred on the third day The possibility of delayed reaction should be considered whenever foreign protein is administered Prompt recognition of untoward signs may avert a fatal outcome Successful treatment of anaphylactic shock was reported by Blotner [29] with saline solution and by Raynolds [30] with plasma These important aids in the management of shock should therefore be routinely employed, in addition to such routine therapy as epinephrine

In view of the high mortality that accompanies both diphtheria and pertussis during infancy, it is hoped that the publication of a report of these two fatalities will not deter the profession from continuing to practice immunization It will be recalled that the family history was positive for allergy, the father suffered from what appeared to be episodes of angioneurotic edema

That heredity is dominant in the anaphylactic state has been emphasized by Ratner and his associates [31] Landsteiner and Chase [32] and Chase [33] demonstrated experimentally the role of heredity in both local (cutaneous) and general hypersensitivity Allergic manifestations in seven pairs of identical twins were reported by Criep [34] It would seem that the influences of heredity and twinning deserve weight as determinants of individual predisposition in the cases reported here A search of the literature disclosed no other fatalities following inoculation with pertussis antigen and diphtheria toxoid, whether separately or combined

After being notified of the deaths, the manufacturer recalled the entire batch from which the biologic product had been dispensed A search of all records of complaint was immediately instituted To date no reports of serious reactions have been received, and all tests on the lot in question were found satisfactory

Kendrick,[35] in a field study of alum-precipitated combined pertussis and diphtheria toxoid, found among records of local and general reactions in 900 children only a few that were described as pronounced Of further interest in connection with the degree of possible hazard attached to some immunizations is the experience of Friedman,[36] who gave 109 allergic children tetanus and diphtheria toxoid without untoward reactions Bigler and Werner [37] observed but 2 instances of allergic response in 300 children receiving tetanus toxoid or combined diphtheria and tetanus toxoids Cooke and his associates [38] reported generalized urticaria following the second injection of tetanus toxoid in an asthmatic patient, and Cunningham [39] reported the occurrence of anaphylaxis following a second injection of toxoid in an adult who had previously had serum sickness The first patient gave positive skin tests to Gerna and Witte peptone, and the second to Witte peptone, both recovered Deaths following the intravenous injection of typhoid vaccine have been recorded [40]

SUMMARY

Identical twins died in delayed anaphylactic shock The widespread occurrence of lesions referable to arterial spasm and increased endothelial permeability contribute further evidence to the basic role of vascular injury in the hypersensitive state [41]

# REMISSIONS IN THYROTOXICOSIS AFTER DISCONTINUING THIOURACIL

WILLIAM H BEIERWALTES M D
and
CYRUS C STURGIS M D
Ann Arbor Mich

A review of the literature has failed to reveal information which might serve to evaluate thiouracil as a possible form of treatment for permanent cure of thyrotoxicosis The main reason for this is that too few patients have been followed for a sufficiently long period to warrant definite conclusions The drug is now released for general distribution, and most physicians have the impression that it has no other use than as a preoperative form of therapy Since a review of our series of 80 patients treated with thiouracil for over two months revealed a very definite pattern of behavior, we considered that enough data were now at hand to justify a few important tentative conclusions that might be helpful as a guide in the treatment of thyrotoxicosis with this preparation

REVIEW OF THE LITERATURE

Apparently Palmer [1] is the only author who has differentiated the nodular from the non-nodular toxic goiters when determining the effect of thiouracil in the production of a therapeutic remission in patients with thyrotoxicosis It is our opinion that this differentiation is an important one, first because the nodular goiters respond less satisfactorily to thiouracil treatment, second because, although the toxic clinical manifestations of nodular goiters are more insidious, they possess less tendency to natural remissions, and third because of the recognized possibility that a certain number of adenomatous goiters will develop carcinoma It was observed by Palmer [1] that all the 9 cases of thyrotoxicosis observed by her in which there was no evidence of a recurrence of the disease after the medication had been discontinued for six months were of the diffuse hyperplastic type She also stated that thus far no patient with a nodular thyroid had experienced a remission of more than four months after treatment with thiouracil was discontinued No other information concerning these patients was supplied

Williams and Clute [2] reported 98 cases of thyrotoxicosis treated with the drug for more than four months Thiouracil was administered continuously for more than a year in 10 of these, for more than eight months in 36 and for more than four months in 52 In only 5 was the administration of the drug discontinued and their subsequent course observed during the time when all therapeutic measures were omitted One of these had been treated for six months and the rest for one year One had remained normal for a period of six months and 4 for two to three months Another patient experienced a relapse after two months Other details, such as the type of goiter and the initial basal metabolic rate were not given The 20 per cent relapse in this group was not of statistical significance One other observation of theirs also coincided with the experience of others, namely that at least 2 patients who discontinued treatment of their own accord, on three

2 Williams R H and Clute H M Thiouracil in the Treatment of Thyrotoxicosis J A M A **128** 65 (May 12) 1945

separate occasions and after short periods of treatment, had recurrences in approximately one month or less

The administration of thiouracil was discontinued in 18 of 51 cases reported by Astwood [3] In 9 of these therapy had been given for only "relatively short periods" In 1, however, the treatment had been continued for as long as one hundred and fifty-one days The symptoms in all patients recurred "promptly" In the other 9 cases, on the other hand, in which therapy had been continuous for periods of six and one-half to eight months, long continued remissions occurred These patients had been followed, at the time of publication, for periods of from two to nine months Here we again see the tendency to rapid relapse of the disease following short periods of treatment, as contrasted to much longer remissions following the administration of the drug over more prolonged periods

Lastly, Barr and Schorr [4] have reported their results on 70 patients treated from two to twenty-one months Their observations again indicate that a prompt recurrence of thyrotoxicosis will occur when the preceding period of treatment has been short, and more prolonged remissions will be noted when it has been more prolonged Thus of 13 patients who had the administration of thiouracil discontinued after less than six months of treatment, 4 had relapses, whereas in only 11 of 48 patients treated for a longer period did recurrences develop In these 11 the recorded interval between withdrawal and relapse varied between one and seventeen months, 6 relapses occurring after one month The 77 per cent of the 48 patients who did not have relapses had been followed in 6 instances for an average of 6 1 months, while another 6 had been observed less than two months The type of goiter and all the initial basal metabolic rates were not noted

TABLE 1.—*Total Duration of Treatment with Thiouracil in Twenty-Nine Patients with Toxic Diffuse Goiter and Toxic Adenomatous Goiter*

| Time Followed (in Months) | Number of Patients |
|---|---|
| 18 21 | 6 |
| 10-18 | 2 |
| 12 14 | 3 |
| 9-12 | 10 |
| 6- 9 | 3 |
| 4 6 | 5 |

In summarizing this brief review of the literature pertaining to remissions of thyrotoxicosis after treatment with thiouracil has been discontinued, we find that the information thus provided is inadequate in that (1) the number of patients is too small and they have been followed for too short a period of time to provide convincing information and (2) in the majority of the patients *there is no statement concerning the type* of goiter or the height of the initial basal metabolic rate

It should be emphasized, however, that these studies have been of value, since they show that following a discontinuance of thiouracil (1) a recurrence of symptoms is apparent, almost always within a period of two months if the drug is given for only short periods, usually less than six months, (2) there is a tendency for such a therapeutically induced remission to continue throughout the period of subsequent observation if it persists for more than the critical interval of two months after the thiouracil is omitted and (3) of the patients treated adequately for more than six months 80 per cent have a remission lasting throughout the period of observation which has usually been longer than the critical two month period

### CASE MATERIAL

Our series consists of 80 patients with thyrotoxicosis who were treated with thiouracil for more than two months Eighty per cent of these patients have been given the drug initially while confined to the hospital under close observation After discharge their subsequent course has been followed at one to three month intervals in the outpatient department with clinical observations and with determinations of the basal metabolic rate and the cholesterol content of the blood While in the hospital the patients were at rest in bed and received only sedation and brewers' yeast until two determinations of the metabolic rate had been made over a period of five days Thiouracil was then given in a dosage not exceeding 0 6 Gm per day The condition of each patient was then followed with weekly determinations of the basal metabolic rates and of the cholesterol content of the blood, and with leukocyte and differential white blood cell counts, which were performed every other day When the basal metabolic rate reached approximately zero, the thiouracil dosage was reduced to 0 2 Gm per day If on the next return visit in two months the basal metabolic rate was below zero and the clinical picture coincided with this observation, the dosage was reduced to 0 1 Gm per day Furthermore, if on a subsequent visit two months or more later it was again below zero on this reduced dosage, administration of the drug was discontinued In this way the clinical response of the patient served as an indication for the discontinuance of the medication The patient was then observed in the same manner as he had been while receiving the drug in order to check the possibility of a recurrence

Of the 80 patients studied in this manner 31, or 38 7 per cent, had nodular goiters Twenty-four of the 80 patients have had a thyroidectomy Of these patients in whom thyroidectomy was performed, 20 had nodular goiters and 4 non-nodular Our policy is to operate on all patients with nodular goiters as a prophylactic measure against carcinoma of the thyroid The 11 patients with nodular goiters who have not had a thyroidectomy done as yet are still being treated with thiouracil because operation was refused,[5] the patient's condition was unsatisfactory for operation or preparation for thyroidectomy is now in progress

The 4 patients with non-nodular goiters who have been subjected to thyroidectomy, as mentioned, have had surgical treatment at their own request or because of complications associated with thiouracil administration [6]

*In our group of 80 patients there are 45 with* toxic non-nodular goiters who have not had a thyroidectomy performed It is in a study of these patients that we have a special interest because an attempt has been made in them to produce a permanent remission with thiouracil It has been possible to follow 29 of these patients for more than four months since thiouracil therapy was instituted Table 1 shows a chronological breakdown of this group

Thirteen of the 29 patients have discontinued treatment with thiouracil either against our advice or with our consent In general, our conclusions, based on

3 Astwood E. B Thiouracil Treatment in Hyperthyroidism J Clin Endocrinol 4 229 (June) 1944

4 Barr D P and Schorr E. Observations on the Treatment of Graves Disease with Thiouracil Ann Int Med 23 754 (Nov) 1945

5 Beierwaltes W H and Sturgis C C Complications Following the Administration of *Thiouracil* Am J M Sc *to be published*

our observation of these patients, are in accord with those noted in the review of the literature, namely that there is a tendency to rapid relapse of the disease after short periods of treatment, as contrasted to more persistent remissions following more prolonged administration of the drug Thus we find in table 2 that 5 or 38 per cent, of the 13 patients in whom thiouracil treatment was discontinued after an average period of only three and one-half months have had a rather prompt symptomatic recurrence of the thyrotoxic state and an elevation in the basal metabolic rate

On the other hand, in table 3 we find that 8, or 62 per cent, of the 13 patients whose thiouracil medication was omitted have had remissions persisting longer than the usual critical period of two months and, indeed, continuing to date

Our experience indicates, then, that 45 per cent of all patients with thyrotoxicosis of the type observed in a large general hospital in the Middle West could be treated with some degree of success by thiouracil alone After more than twenty-two months' experience with the drug it has been possible to discontinue its administration in 8 patients, which constitutes 22 per cent of this special group or 10 per cent of the initial series, with resultant remissions to date Undoubtedly the criteria that we have outlined for the omission of the drug are more rigid than those of other observers In our opinion, however, these rules were justified by the recurrence of symptoms in 5 patients, which number comprises 13 per cent of the selected group, or 6 per cent of the initial series, who did not follow these criteria Since over 60 per cent of those discontinuing treatment with the drug in this selected group have had no recurrence and since a reappearance of symptoms occurred in those who omitted the drug prematurely and against advice, we must conclude that our data, though possibly not statistically significant, reaffirm the results previously noted in the literature

## COMMENT

Before reaching conclusions regarding the permanence of the results attained by thiouracil medication of patients with thyrotoxicosis, it is necessary to review certain basic considerations The first of these considerations is that the natural history of untreated toxic non-nodular goiter is that of a self-limiting disease characterized by natural remissions and exacerbations In 1913, before the use of iodine in the management of the condition, Plummer[6] reviewed in detail the course of 2 917 patients with goiters operated on at the Mayo Clinic between Jan 1 1909 and Jan 1 1913 Of the patients who had diffusely hyperplastic goiters with thyrotoxicosis he said "If the average course of the intoxication be represented by a curve, the greatest height is reached during the latter half of the first year and then suddenly drops to the twelfth month In many instances it reaches the normal base line during the next six months More often it fluctuates with periods of exacerbation for the next two to four years Secondary symptoms and exophthalmos may remain, but the active course only rarely continues over four years without distinct intermissions" In 1924 Barker[7] stated that the average duration of hyperthyroidism with non-nodular goiter was about two to three years regardless of how it was treated 'medically, surgically or radiologically" In his words "You may, it is true compel a subsidence of symptoms by treatment but rarely a cure until this time has elapsed, moreover, after recovery from one attack these patients are prone to recurrences in later life" More recently Fitz[8] has emphasized this cyclic nature of both the untreated and the treated disease He discusses 1 case which clearly shows the fallacy of referring to the statement "permanent remission" This woman had a thyroidectomy for thyrotoxicosis in 1913, again in 1924, another eight months later and, finally, another in 1932 Each thyroidectomy was followed by a remission in the course of the disease

With this knowledge of the life history of the untreated disease, or even of the treated disease, one readily appreciates the necessity of first reviewing the evidence, which may suggest to some that thiouracil does more than maintain the patient in an asymptomatic state until a natural remission occurs Iodine has been used in this manner when medical treatment alone was

* Diagnosis in doubt because of hypertension of 230/90

indicated That the iodine effect on the active thyrotoxic state disappears within a short time after the drug has been withdrawn has been amply demonstrated by Means[9]

In our opinion thiouracil does have an effect different from iodine in that it may produce a change which persists for at least a period of some months after administration of the drug is discontinued The evidence in support of this consists primarily of the data already presented This shows that if there is a recurrence of the thyrotoxic state after therapy is omitted it manifests itself in the great majority of cases within the subsequent two months Thus when remissions persist longer than two months we presume, at least, that some change must have occurred, probably induced by the drug, that permits a more prolonged and more complete remission Since, as noted by Plummer, the average patient with untreated thyrotoxicosis does not experience a complete natural remission in less than eighteen months the fact that our more persistent remis-

6 Plummer, H S The Clinical and Pathological Relationship of Simple and Exophthalmic Goiter Am. J M Sc 146 790 1913
7 Barker L F Exophthalmic Goiter Internat Clin. 1 1 (March) 1924
8 Fitz Reginald A Panoramic View of Thyrotoxicosis, J A M A 125:943 (Aug 5) 1944
9 Means J H Thyroid and Its Diseases Philadelphia J B Lippincott Company 1937

sions occurred in the majority of cases with less than one year's treatment and continued in 8 cases for more than two months is convincing evidence that the remission was induced rather than spontaneous It should be remembered, however, that if treatment is continued for more than eighteen months and then discontinued, the resultant remission might well be a natural one

It has been suggested that thiouracil could not induce a relatively long remission because it produces in the gland a hyperplastic but functionally inefficient state It has been recognized that a hyperplastic state of the thyroid can exist in a patient experiencing a relatively permanent remission of his thyrotoxicosis This has been demonstrated by the structure of the remnant of the thyroid gland after thyroidectomy by Rienhoff[10] and Branch They examined sections of the thyroid gland removed several months after thyroidectomy and found the characteristic evidence of stimulation of the thyroid Even though this state of hyperplasia persists, Preston and Thompson[11] concluded that a single thyroidectomy may accomplish control of the toxic state sufficiently to avoid subsequent operations in 85 per cent of the patients

Treatment with thiouracil has the same effect as thyroidectomy, at least temporarily This is accomplished by reducing the function of the thyroid tissue by interference in the iodine concentration and oxidation process of the gland It is entirely possible that the hyperplastic state of the thyroid induced by thiouracil changes to a state of normal involution after a variable time Evidence in support of this is to be found in the report of Shirer and Cohen,[12] who observed a normal morphologic picture in a thyroid gland removed from a patient previously treated unsuccessfully for seven months with thiouracil

Further evidence of the active effect of thiouracil in producing a more permanent change in thyroid function is found in the case reported by Barr,[4] and in 1 observed in our series in which a thiouracil induced picture of myxedema recovered slowly over a period of six months after treatment with thiouracil was discontinued

In our opinion this evidence indicates that thiouracil does more than iodine in that it produces a change in the thyrotoxic state which persists after the administration of the drug is discontinued

## CONCLUSIONS

Thiouracil may be used in about one third of the thyrotoxic patients only as preoperative treatment, since these patients possess nodular goiters which might develop a malignant condition Another 7 per cent of the total number will require thyroidectomy on account of complications which occur during thiouracil therapy The most serious of these complications to be kept in mind is agranulocytosis[5] About 15 per cent of the patients with thyrotoxicosis will leave the physician's care for personal reasons of the patient, which are in some instances related to difficulties encountered in thiouracil therapy

In the remaining 45 per cent of the total group, made up of those with toxic hyperplastic goiter, thiouracil therapy may be discontinued at the end of a little over an average of ten months with the prospect that 60 to 80 per cent of the patients will experience a relatively persistent drug induced remission For this selected group, at least during the period of observation which has continued to date, this result is as satisfactory as that of subtotal thyroidectomy The majority of patients with thyrotoxicosis, however, must be treated by surgical means Those receiving thiouracil must continue treatment with the drug for indefinite periods For these reasons surgery is still the treatment of choice in the management of this condition Thiouracil is superior to iodine, however, as it is more specific in its action and induces a more complete and permanent remission in patients with this disorder In the treatment of selected cases of thyrotoxicosis, therefore, thiouracil treatment must be considered as a form of therapy which has promise, and ultimately it may prove to be as satisfactory as thyroidectomy in this group of patients

# INDUSTRIAL MANAGEMENT AND OCCUPATIONAL CANCER

W C. HUEPER, M.D
New York

The term "occupational cancer" applies to malignant tumors which originate in persons during the course of and as the result of the regular and usually prolonged exercise of certain occupational activities which entail contact with some exogenous, physical or chemical carcinogenic agent acting in proper intensity Occupational cancers are in general elicited by specific factors which form an integral part of the ordinary working conditions and thus are not the result of some unforeseen, accidental injury sustained while at work

Although a few of the cancers so far recognized as of occupational origin have been known or have existed without correct recognition prior to the advent of the modern industrial era, such as the soot cancer of the chimney sweeps and the cancer of the lung of the cobalt and uranium miners in Schneeberg and Joachimsthal, the great majority of occupational cancers appeared after the start of the present industrial development and as a result of it During the last century there occurred not only a constant rise in the absolute number of these malignant growths but also a decided increase in the types of organs affected by them, in the number of exogenous occupational agents involved in their production and in the variety of manufacturing establishments in which workers were afflicted with them

An analysis of the available data on occupational cancer has shown that the type of the resulting tumor, the length of the latent period preceding its manifestation, the organ affected and the age of the person involved depend on the character of the carcinogenic agent, the type and intensity of exposure and the age of the person when the first exposure takes place The soot cancer of the scrotum found in chimney sweeps, for instance, was observed some hundred and twenty-five years ago even in children, since boys as young as 4 years were used in England at that time for cleaning chimneys The exposure to the carcinogenic soot during this operation was severe, and the degree of cleanliness among these unfortunate youth was very low When, during the middle of the last century, the English government repeatedly raised the age limit of the apprentices of this trade, there followed a gradual rise of the age range at which the scrotal cancers appeared among chimney sweeps At the same time the institution of better hygienic conditions and the improvement of working tools and of chimney construction reduced

From the Warner Institute for Therapeutic Research

the degree of exposure to soot As the result of these changes the scrotal cancer of chimney sweeps in England now appears at the same age as that found in members of the general population affected by cancer of the scrotum of unknown etiology Only the increased incidence of this particular type of tumor among chimney sweeps has remained as evidence of the action of an occupational carcinogenic agent

However, not all occupational cancers have followed such a favorable development Whenever the managers of new plants and their medical advisers have neglected to profit in the construction and operation of their establishments, from the adverse experiences previously had by other manufacturers in the same fields there has appeared some ten to fifteen years later a renewed, acute and sometimes epidemic-like occurrence of occupational cancers in these industries Such a course of events is exemplified by the incidence of cancers of the urinary bladder in workers of the aniline dye industry These tumors were first observed in 1895 in German dye works and were later found among the chemical workers of other countries, such as Switzerland, Italy, England Japan and the United States The time of appearance of cancers of the bladder of this origin followed closely the time of large scale development of chemical industries in the countries mentioned Thus the first cancers of the bladder in chemical workers of this country were noted in 1932, that is, approximately fifteen years after the American dye industry had reached large proportions Within the short period of six years thereafter almost 100 cases of this industrial cancer occurring in men of relative youth were placed on record from one single chemical concern, attesting to the presence of a relatively massive exposure of the workers to the causative agents—that is, betanaphthylamine and benzidine The full significance of this incidence figure becomes apparent from the fact that there were only about 300 cases of this particular occupational cancer reported, according to the statistics of the German government, from the entire German chemical industry within a period of forty years, that is from 1895 to 1935 Although no authentic data are available as to the occurrence and the incidence of tumors of the bladder among the workers of other American chemical concerns, the existence of such cases is known

Cancers resulting from contact with radiant energy—that is, the rays from radioactive substances and roentgen rays, illustrate strikingly the influence which the type and intensity of contact exert on the formation of the ensuing tumor It appears that the inhalation of radioactive gases or radioactive dust causes cancer of the lung, such as that sustained by miners in Schneeberg and Joachimsthal, whereas the local action of radioactive and roentgen energy on the skin causes the development of cancers of the skin, such as those seen in radiologists, roentgenologists, their assistants, and in x-ray tube manufacturers, physicists and engineers The ingestion of radioactive matter, on the other hand, causes the development of cancers of the bones, such as those observed several years ago in girls who applied luminous paint to dials However, in more recent years cancers of the blood, known as leukemias, have been noted in increasing number among physicians and radium chemists exposed frequently to relatively small doses of roentgen rays or rays from radioactive matter These deleterious effects on the blood-forming tissue have their cancerous equivalents in the leukemias observed among persons exposed to benzene This organic solvent like roentgen rays and rays from radioactive substances, causes a destruction of the blood-forming tissue and results in a fatal anemia when acting in large doses, but it may elicit leukemic responses when acting in small doses and in suitable intervals on the blood-forming tissue

In most cases of industrial cancer, experimental research on cancer has succeeded in demonstrating the specific carcinogenic agent involved by using these agents to reproduce similar tumors in animals Definite proof of carcinogenic properties have thus been obtained for arsenic, tar, pitch, soot, crude mineral oil, crude paraffin oil, anthracene oil shale oil, some fuel and lubricating oils, creosote, benzene, aromatic amines, ultraviolet rays, roentgen rays and rays from radioactive substances In recent years, however, cancers of the lung have been noted among workers in chromate plants, nickel refineries and asbestos-manufacturing establishments These tumors are either suspected or recognized as being of occupational origin An interesting feature of these cancers is represented by the fact that the cancers of the lung in chromate workers were observed only in several German plants, while the cancers of the lung in nickel refinery workers were found exclusively in English plants where the nickel carbonyl process was used Although the same process is employed in some nickel refineries located in Canada and the United States, cancers of the lung have not been noted among the workers employed here if full credence can be given to the meager information available on this matter Cancer of the lung in asbestos workers, on the other hand, has been reported from Germany England and the United States The actual causative agent in the production of cancers of the lung in chromate nickel and asbestos workers is still unknown

The rapid increase in the number of recognized and suspected agents causing industrial cancers which have occurred during the last forty years makes it more likely that new and heretofore unsuspected carcinogenic agents of an industrial nature will be discovered during the coming years Such a development is foreshadowed by observations made during recent years by American investigators It was found that cancers of the liver developed in mice exposed to carbon tetrachloride, a commonly used organic solvent The inhalation of ethyl carbonate (urethane), which is employed for anesthetic purposes, resulted in the appearance of cancers of the lung in mice Tumors of the bladder were formed in rats fed diethylene glycol, which is one of the newer widely used organic solvents Tumors of the peripheral nervous tissue were seen in the ears of rats to which crude ergot, a drug extensively used in obstetric practice, had been fed over long periods

Occupational carcinogenic agents produce cancers in numerous organs Cancers of the skin are elicited by contact with arsenicals, tar, pitch, soot or carbon black, crude mineral oil, lubricating oil, shale oil, crude paraffin oil, anthracene oil, solar and ultraviolet rays roentgen rays and rays from radioactive substances The number of industrial cancers of this organ runs into several thousands Cancers of the nasal passages have been noted after occupational exposure to chromates, nickel carbonyl and radioactive substances Cancers of the bronchi and lung have been traced to an industrial exposure to arsenicals, chromates, nickel carbonyl, soot, tar, asbestos and radioactive substances Cancers of the lip have appeared following contact with tar and after prolonged exposure to solar rays, while cancers of the mouth and of the tongue seem to be etiologically related to an industrial contact with tar and arsenicals. Cancers of the bladder, of the ureter and of the kidney have fol-

lowed occupational exposures to aromatic amines such as naphthylamine, benzidine and aniline and occasionally to tar and arsenicals Cancers of the blood, called leukemias, have resulted from contact with benzene, roentgen rays and rays from radioactive substances The latter are also responsible for the occurrence of cancer of the bones

The exposure time necessary for eliciting cancerous reactions in exposed workers varies greatly with the type and potency of the carcinogenic agent, with the intensity of exposure and with the susceptibility of the individual The range is from six months to three to four decades, while the average exposure time is from five to fifteen years In most instances occupational cancers appear in a younger age group than that found for the same cancer of unknown etiology in the general population Age and sex factors do not, as a rule, play any role in the production of industrial cancers The incidence rate of these tumors shows decided variations not only for the different carcinogenic agents but also for the different operations and is directly proportional to the potency of the carcinogenic agent and the intensity and length of exposure Cancer of the bladder thus affects from 30 to 90 per cent of the severely exposed dye workers, while cancer of the lung kills from 75 to 80 per cent of the cobalt miners of the Schneeberg mines Carcinogenic agents eliciting occupational cancers of the skin, on the other hand, have a lower morbidity and mortality rate because the precancerous changes of the skin preceding the appearance of the tumors gives ample warning, as a rule, of the threatening malignant condition while the ready accessibility of the skin to therapeutic measures enhances the prognosis of cure It is of a certain importance from an industrial point of view that the skin of colored workers is less susceptible to the cancerigenic action of solar rays and of tar pitch and similar substances than that of white, and especially of fair-skinned, workers

The total number of occupational cancers placed on record is small when compared with the large number of cancers of unknown etiology It is obvious, however, that the latter group contains an undetermined number of cancers of occupational origin, as many of them either are not properly recognized or are not made a matter of public information

Although today a great deal of evidence on the causes of occupational cancer and the conditions under which it develops is available, relatively little effort has been made to spread this knowledge among parties who are vitally concerned with this information, namely the managers and physicians of industrial concerns, although they carry the main load of controlling this preventable type of cancer This situation is the more deplorable because the present rapid development of industry tends to extend the hazards of the known industrial carcinogenic agents while at the same time creating new ones which may cause the appearance of cancers ten to twenty years hence, unless concerted efforts are made in time to discover and control such dangers by appropriate countermeasures It is essential that industry should devote considerably more effort than heretofore to determining the cancerous or noncancerous nature of such of its numerous products as may be suspected on general grounds of cancerigenic properties As occupational cancers are chance experiments on cancer in man, conducted by modern industry on a large scale, which render direct reliable and conclusive information as to the cause and mechanism of human cancer, the investigative study of these conditions deserves a great deal more consideration than it has been given in the past The experience gained from the study of occupational cancer, and especially of its causative mechanism and its prevention and control, should prove of great value in the future in fighting cancer in general at its source, that is, it should aid in the elimination of the causes of cancer before they are capable of initiating the malignant growths In waging this campaign it should be realized that a well planned, systematic and, probably, prolonged attack must be launched if worth while results are to be expected However, I am convinced that with the necessary perseverance and determination this battle against occupational cancer in particular and against cancer in general can be won, if every one concerned aids in the effort

If industry can be persuaded to finance the foundation and maintenance of an organization exclusively devoted to the study of the causation and control of industrial cancers, not only will industry be the main beneficiary of this move, but also it will greatly advance the fight against cancer in general, which is of direct concern to every one, unless it is forgotten that every tenth adult dies from this disease

## RECOMMENDATIONS FOR THE CONTROL OF OCCUPATIONAL CANCER

1 Plant management officials, industrial workers and members of the medical profession must be made increasingly aware of the fact that numerous agents of our new industrial environment possess carcinogenic properties

2 Construction and chemical engineers should design buildings, machinery and apparatus with this hazard in mind—that is, they should try to favor the closed system of production, the installation of adequate exhaust ventilation, the use of building material which does not absorb carcinogenic substances, the avoidance of nooks, crevices and ledges where carcinogenic dust can be deposited, and the employment of wall and floor covering that can be thoroughly and repeatedly cleaned with water and steam used in connection with cleansers

3 Adequate provision must be made for the removal of carcinogenic material from waste gases, fumes, waters, dust and the like before these waste products are released into the air, public waters or other channels affording the contact of the general population with carcinogenic industrial wastes

4 Carcinogenic material must be packed in leak proof containers

5 Similar appropriate protective technical measures should guard the persons handling roentgen rays and radioactive substances from being exposed to deleterious quantities of radiant energy

6 These measures must be sufficiently extensive to protect also persons working or living in the immediate environment where physical or chemical carcinogenic agents are handled

7 Whenever the use of carcinogenic material in industry cannot be eliminated by the use of substitutes, workers should be protected from contact with carcinogenic agents by suitable protective clothing, gloves masks and the like and by the enforced observance of adequate hygienic measures, such as the use of washing facilities, showers and special rooms for storing street clothes and for taking meals and frequent changes of working clothes

8 Frequent and experienced medical supervision of the workers exposed to carcinogenic material is imperi-

tive for effective control of the hazard This supervision must also extend to workers who have left the employment after having been exposed to carcinogenic agents for a sufficiently long time or who have been shifted to noncarcinogenic operations

9 A nationwide survey by skilled investigators should be made to determine the actual scope of the problem of industrial cancer Representatives of management, industrial physicians, members of the Public Health Service and of departments of industrial hygiene and possibly also representatives of the workers should participate in such a survey

10 Precancerous and cancerous industrial diseases should be made notifiable to the departments of industrial hygiene of the various states

11 Adequate compensation laws for occupational diseases should be passed for the protection of both management and workers against excessive awards or inadequate compensation, respectively, for claims that result from the production of occupational cancers

12 Government inspectors should examine all industrial plants at regular intervals to determine whether or not they meet the essential safety requirements necessary for minimum protection of the workers against the hazards of industrial cancer

13 An institute for the study of industrial cancer should be founded and should be attached to or coordinated with one of the existing large cancer research centers, in order to provide for proper integration of the results obtained by such investigations with those produced by cancer research in general Such an organization would serve industry for consultative and investigative purposes on matters of occupational cancer

14 A committee composed of industrial physicians, cancer research workers, industrial physicists, chemists and engineers, compensation lawyers, members of the Public Health Service and of state departments of industrial hygiene, representatives of industrial management and union officials should be created, whose members should act as a body of consultants and special experts to the Institute for the Study of Occupational Cancer

---

**Art and Anatomy**—Among the great artists who engaged in dissection were Michael Angelo Raphael and Albrecht Dürer Greatest of all was Leonardo Da Vinci (1452-1519) This gifted and versatile artist, a man centuries ahead of his time in original ideas who visualized aviation and modern methods of warfare and who discussed many problems of engineering which were later put into practice, also made discoveries in anatomy such as the maxillary sinus and the moderator band of the heart. He was the first to demonstrate the ventricles of the brain by wax injections and to depict correctly the fetus and its membranes within the uterus Originally he set out to study the bones and muscles in their relation to art, but his interest grew, and he pursued his investigation of the deeper parts, the viscera, the brain the blood vessels and especially the heart. He intended to publish a great work on anatomy in collaboration with Marco Antonio della Torre of Pavia, but this project was abandoned owing to the death of his co worker It is only within recent years that the value of Leonardo s contribution to anatomy has been fully appreciated He made hundreds of sketches and manuscript notes, many of which are preserved in the Royal Library at Windsor and have only recently appeared in print. This apostle of naturalism in art must also be regarded as a leading pioneer in anatomy—Guthrie, Douglas A History of Medicine Philadelphia J B Lippincott Company 1946

## ACUTE SYPHILITIC NEPHROSIS SUCCESSFULLY TREATED WITH PENICILLIN

J H BARR JR. M D H N COLE, M D J R DRIVER M D, ROSCOE D LEAS, M D, MAX MILLER M D,
and
L. G STRAUSS M D
Cleveland

The nephrotic syndrome is defined as a clinical symptom complex characterized by profuse proteinuria, hypoalbuminemia and edema without serious renal insufficiency or hypertension It may be seen in a variety of conditions and has been observed in connection with acute syphilis [1]

### REPORT OF CASE

*History*—J Y, a white man aged 31 was first admitted to University Hospitals July 18, 1945 with a chief complaint of generalized edema and genital ulcerations of approximately one week's duration

In the early part of June 1945 several superficial lesions developed in the coronal sulcus of the penis These gradually enlarged, with subsequent ulceration July 2 he was seen by one of us (L G S), who made the diagnosis of chancroid of the penis and started the patient on sulfathiazole two tablets four times daily This was continued until July 6 when the result of the serologic test for syphilis drawn at the first interview was reported as strongly positive. On July 7 he was given 0 04 Gm of oxophenarsine hydrochloride (Mapharsen) intravenously, with no immediate reaction However eight to twelve hours later he had a shaking chill and temperature elevation to 104 F Within twelve hours the patient was again symptom free July 10 another injection of 0 02 Gm of oxophenarsine hydrochloride was given intravenously, without ill effect. He returned on July 15 and at that time had moderate edema of the face, legs penis and scrotum and complained of general malaise anorexia and low back pain No urine examination was done at this time. On July 17, when he was seen again, the edema of the face, legs, penis and scrotum was more severe The urinalysis revealed 4 plus proteinuria and an occasional red blood cell On July 18 the edema was less severe and the urine contained only an occasional red blood cell He was then referred to University Hospitals for study

*Physical Examination*—The temperature was 37 C (98.6 F), pulse rate 82, respiratory rate 18, blood pressure 124/72, weight 78 1 Kg He was well developed and well nourished He did not appear to be in distress There were no abnormalities of the skeletal system The mucous membranes were of normal color with no abnormal lesions There was slight facial edema, especially noticeable about the eyes There vas no apparent edema of the upper extremities There was moderate pitting edema of the sacrum, external genitalia, thighs and legs The skin was normal in color and texture, with no abnormal lesions There was a well defined, firm, freely movable nontender lymph node in the right inguinal region measuring 2 by 2 cm There were two smaller lymph nodes similar in character in the left inguinal region. There was no other lymphadenopathy

There was moderate periorbital edema The conjunctivis were pale. The corneas and scleras were normal The pupils were equal and regular, measured 4 mm and reacted normally

to light and in accommodation The extraocular muscles were normal Ophthalmoscopic examination revealed that the fundi and disks were normal Mouth and throat did not show abnormality

The thyroid gland was normal There was no evidence of venous distention Tracheal tug was not present The chest was normal in size and contour The percussion note was resonant throughout and the breath sounds were normal in intensity and character There were no rales The heart was not enlarged The apex was percussable 10 cm from the midsternal line in the fifth intercostal space. The sounds were normal in intensity and character There were no murmurs The rhythm was regular The peripheral vessels were normal The liver, spleen and kidneys were not palpable There was slight pitting edema of the lower abdominal wall

The scrotum and penis were moderately swollen In the coronal sulcus there were four small shallow superficial tender ulcerations ranging in size from 0 5 to 0 9 cm with well defined irregular slightly undermined borders The bases were clean but covered with a thin seropurulent exudate The tone of

Observations in the case reported

the rectal sphincter was normal There were no hemorrhoids The prostate was asymmetrical The left lobe was abnormally large. The right lobe was normal in size. The gland was freely movable, smooth and normal in consistency

The cranial nerves all functioned normally Muscle strength was normal Vibratory, pain and temperature sensations were all normal The deep tendon reflexes were all equal and normally active There were no pathologic reflexes

*Laboratory Examinations*—The hemogram was normal The urine was yellow and clear, with a specific gravity of 1 030, the reaction was acid albumin was 4 plus, tests for sugar were negative and the benzidine test was negative. Microscopic examination revealed 1 or 2 red blood cells per high power field on the first examination only, a few white blood cells per high power field and a few hyaline casts per high power field The twenty-four hour protein excretion was 2 9 Gm. The twelve hour Addis count revealed a specific gravity of 1 027, 1,600 000 white blood cells and 800,000 red blood cells The serologic test for syphilis revealed a 4 plus Wassermann, 4 plus Kline diagnostic and Kline exclusion of 160 units (approximately 40 Kahn units) Total serum proteins were 4 09 Gm per hundred cubic centimeters, albumin was 1 54 Gm per hundred cubic centimeters, globulin was 2 55 Gm per hundred cubic centimeters and the albumin-globulin ratio was 0 60 Gm per hundred cubic centimeters Serum cholesterol on the first hospital day was 433, on the eleventh hospital day 380 and on the nineteenth hospital day 267 mg per hundred cubic centimeters Urea clearances were 140 per cent of normal the first hour and 82 per cent the second hour Blood urea nitrogen was 10 5 mg per hundred cubic centimeters and nonprotein nitrogen 30 8 mg per hundred cubic centimeters. Lumbar puncture gave normal results X-ray examination disclosed no evidence of a pathologic process in the chest The heart and aorta were normal in size and contour Excretory urograms revealed that diodrast excretion was normal The kidneys were questionably enlarged with no other evidence of abnormality The basal metabolic rate was 4 per cent An electrocardiogram was normal Bacteriologic examinations revealed no Hemophilus ducreyi organisms Repeated dark field examinations of penile lesions revealed no Treponema pallidum Intradermal tests with Frei and Ducrey antigens were negative in forty-eight and seventy-two hours Urethral smear and culture following prostatic massage were negative for Neisseria gonorrheae organisms

On the basis of the history and the clinical and laboratory findings the diagnosis of early acquired mucocutaneous syphilis with associated syphilitic nephrosis was made The patient was given a high protein, low salt diet and was placed on bed rest The proteinuria decreased and diuresis occurred with a 1 Kg weight loss within the first three hospital days Penicillin sodium 20,000 units every three hours intramuscularly for a total of 2 400,000 units in a fifteen day period was started on the third hospital day Improvement in renal status was spectacular, with complete disappearance of edema, a weight loss of 10 Kg and only minimal proteinuria six days after institution of penicillin therapy

On the twelfth hospital day the diuresis was complete and the weight was maintained between 68 and 70 Kg throughout the hospital stay Urinalyses, kidney function tests and clinical examinations were all normal at this time and remained so throughout the hospital stay The penile lesions were completely healed on discharge on the twenty-second hospital day

*Subsequent Course*—Blood pressure and urinalysis at weekly intervals after discharge from the hospital remained within normal limits Clinical examinations and blood serologic tests at monthly intervals showed rapid reversal of the positive serologic test for syphilis to negative.

The patient was readmitted to University Hospitals on Nov 1, 1945, an interval of approximately three and one half months since his discharge. At this time physical examination gave normal results A reevaluation of renal function including urinalysis urea clearances, twenty-four hour Mosenthal concentration dilution test, twenty-four hour Addis count, twenty-four hour urinary protein excretion and serum cholesterol examinations were all normal The patient's weight at this time was 73 9 Kg and his serologic test for syphilis was negative.

## COMMENT

It is our opinion that the diagnosis of syphilitic nephrosis is highly probable in this case It is certain that the picture presented could hardly have been the result of arsenical therapy since trivalent arsenic is usually hepatotropic rather than nephrotropic and in the latter case produces a hemorrhagic nephritis Nor did the symptomatology during the four days of sulfonamide therapy make one think of a sensitivity reaction due to sulfathiazole On the other hand, the patient had a penile lesion, an accompanying nephrotic syndrome and positive sero

logic test for syphilis The diagnosis seemed to be confirmed by his response to penicillin therapy, as indicated by the rapid weight loss, the decline in twenty-four hour urinary protein excretion, the increase in the albumin content of the blood and complete cure in a ten day period, a sequence of events distinctly unusual in any type of adult 'lipoid" nephrosis

In the past it has been found that acute syphilitic nephrosis was hardly amenable to mercury therapy and many of the patients died With trivalent arsenical therapy, results were much better though far from perfect Penicillin therapy theoretically should be ideal for this condition as there have been no reports of renal irritation following its administration This seemed to be true in the case reported

It would, of course, have been desirable to have a pretreatment urinalysis In addition it must be noted that a slight (1 Kg) weight loss occurred in the first two hospital days on bed rest and low salt diet alone The other evidence, however, is so strong that we believe it is justifiable to make the diagnosis of acute syphilitic nephrosis To date the patient has remained clinically well for a period of three and one-half months and the serologic test for syphilis has rapidly reversed from 40 Kahn units to negative.

SUMMARY

A white man having a genital lesion, the nephrotic syndrome and a positive serologic test for syphilis was successfully treated with penicillin Penicillin is probably the ideal agent for the treatment of acute syphilitic nephrosis [2]

2 The results which have been presented in this paper must be interpreted in light of the fact that from June 1943 the date of inception of the study to the present commercial penicillin has been a changing mixture of various substances. The content of impurities has gradually decreased as potency in terms of units per milligram has increased The relative amounts of the several identified penicillin fractions C, F X and K have likewise varied from time to time Those two changes and perhaps others suggest that therapeutic efficacy may not have remained constant and that it may be significantly different today from what it was originally It is not now possible to assess the extent to which these changes may have affected the results here reported

AUSTIN SMITH, M D, *Secretary*

### RUTIN

Recent newspaper articles announcing Rutin as a 'cure" for high blood pressure, based on a release from the United States Department of Agriculture, have again demonstrated the inadvisability of premature publicity concerning new medical discoveries As a result of these articles the office of the Council on Pharmacy and Chemistry has received numerous inquiries concerning the properties and availability of this new drug

The only published report in a scientific periodical about the clinical use of rutin at the time this statement was prepared, is a brief note by Griffith, Couch and Lindauer (*Proc Soc Exper Biol & Med* **55** 228 [March] 1944) describing preliminary observations on 14 patients with increased capillary fragility treated with rutin. The authors concluded that in certain cases rutin appears to have the property of decreasing capillary fragility in subjects in whom this fragility is initially increased"

Rutin is a glucoside found in a number of plants, the principal sources being tobacco and buckwheat Laboratory investigations have been conducted by J F Couch and his associates at the Eastern Regional Research Laboratory of the United States Department of Agriculture at Chestnut Hill, Pa. The clinical work on rutin has been done chiefly at the University of Pennsylvania under the direction of Dr J Q Griffith Jr Although several firms are interested, no commercial production of rutin has yet been made.

Although newspaper accounts state that rutin is a treatment for high blood pressure, the Agriculture Department release stated that, 'according to clinical observations at the Medical School of the University of Pennsylvania rutin is effective in the treatment of conditions arising from high blood pressure associated with increased capillary fragility' This is obviously quite different from saying that rutin is a treatment or 'cure" for high blood pressure. Furthermore, rutin has not been demonstrated to have any effect on the blood pressure of animals or man Also so few data have been presented on variability of capillary fragility in untreated cases of hypertension that assessment of the effect of therapeutic agents is still hazardous

Based on the meager amount of scientific evidence that has been available, it is unfortunate that the hopes of thousands of sufferers from hypertension have been raised by irresponsible and premature publicity Increased capillary fragility is not a common complication of hypertension, and the vascular accidents which are frequently the serious sequelae to this disease may not be due to alterations in capillary resistance. Furthermore, the methods of measuring capillary resistance are crude, and workers in this field are not agreed on the reliability of any of the methods of measurement now employed.

In considering the reports on rutin it is well to keep in mind the experience with "Hesperidin," or "vitamin P," which was alleged several years ago to increase capillary resistance. Carefully controlled experimental and clinical studies on this substance failed to substantiate the claims advanced by the original proponents (Scarborough, Harold *Lancet* **2** 610 [Sept. 10] 1938) It is to be hoped that history will not repeat itself in the case of rutin

## THE HEMAL NODES

In man and in certain of the lower vertebrates nodal collections of lymphoid cells occur, they may be classified as those provided with lymph sinuses, or the lymph nodes proper, and those provided with blood sinuses The latter are variously known as hemolymph nodes, splenolymph nodes or more simply and better, perhaps, as hemal nodes Embryologically the hemal nodes are vascular structures that have become modified in the process of development by the interposition of focal collections of lymphocytes in the meshes of a reticulum derived from the walls of blood vessels The hemal nodes are most numerous and best developed in ruminants, particularly sheep, and are scantiest in man They are commonest in the immediate vicinity of large blood vessels, especially the aorta and its branches notably around the splenic and renal arteries They may be found in the prevertebral and neighboring adipose tissues from the neck to the pelvic inlet as reddish or brownish red bodies which seldom are larger than a few millimeters in their longest diameter

Anatomically, the exact nature of the hemal nodes has not been determined, the preponderance of evidence seems to favor the view that they are more nearly related to the spleen, structurally and otherwise, than to the lymph nodes proper According to another view they are not organs *sui generis* but a system of accessory spleens Evidence of relationship to the spleen is furnished by Tizzoni,[1] who, after experimental splenectomy in the dog, noted the occurrence of minute reddish nodules in the abdominal fat that he interpreted, microscopically, as newly formed splenunculi Similar results have been obtained by Winogradow [2] and by Warthin,[3] the latter however designating the bodies in question as hemolymph nodes although recognizing their close structural and functional resemblance to the spleen

Mosler [4] found innumerable small, circumscribed, reddish nodules scattered through the omentum and mesentery in a dog ten months after splenectomy These closely resembled the structures identified by Tizzoni in animals similarly treated as newly formed masses of splenic tissue In Mosler's animal the microscopic examination was made by Roth, who interpreted the reddish bodies as neoplasmic formations and termed them "hemorrhagic telangiectatic lymphomata" In certain lower forms of life the spleen is a divided organ and is widely distributed through the abdomen With some of the invertebrate fish the spleen is strewn through the subserous tissues of the gastrointestinal tract, while in slightly higher forms it becomes separated and distributed in the tissues that run parallel with the stomach and intestine In still higher fish, particularly among the selachians, the spleen consists of more or less completely separated nodules, a fact which tends to explain the occurrence of accessory spleens in man Accessory spleens numbering one or two to a dozen or more or, as in Albrecht's case, four hundred, have been found in human beings Albrecht noted that the splenunculi were highly vascularized, standing out as reddish or brownish red bodies which at first glance suggested the presence of a metastasizing tumor Microscopically these were found to be plentifully supplied with lymphoid collections, their appearance to the naked eye and histologically thus simulating that of the hemal nodes

Functionally, the hemal nodes are active in the destruction and phagocytosis of red blood cells They seem to provide mechanisms of protection against certain infections, especially in cattle, among them forms of piroplasmosis known as African East Coast (hemoglobinuric) fever and as Texas fever, in both of which the spleen is diseased and the hemal nodes are hypertrophied In East Coast fever Meyer was able to transmit the infection to susceptible animals by inoculations from hypertrophic hemal nodes even in circumstances in which parasites could not be demonstrated in the blood or lymph nodes of the same animal in which the hemal nodes were hypertrophic According to Warthin [5] it is not probable that the hypertrophy of hemal nodes which occurs in Texas fever immune steers is a compensatory process He pointed out that in other diseases of cattle corresponding hypertrophy of the hemal nodes does not occur even when the spleen is still more extensively diseased and hemolysis is more pronounced than in Texas fever He believed that hypertrophy of the hemal nodes in Texas fever immune steers is a protective reaction against latent infections by piroplasmas which are localized in the nodes themselves, as they are in the closely related if not identical East Coast fever Unfortunately, only formaldehyde fixed tissues from Texas fever immune animals were

5 Warthin A S Hypertrophy of the Hemolymph Nodes in Texas Fever Immunes J Infect Dis **22** 331 1923

available to Warthin, so that inoculation experiments could not be made In any event it appears that the anatomically inconspicuous hemal nodes are organs of considerable importance

## ANTHALLAN AND HYPERESTHETIC RHINITIS

Recently newspaper and radio publicity has been given to a report [1] of use in the treatment of 42 patients with "hyperesthetic rhinitis" of a new drug, "Anthallan" Anthallan is a benzofuran derivative, other information on its chemical or pharmacologic properties has apparently not been published, it is said to be marketed by the Medico Chemical Corporation of New York City

The author of the report claims to have coined the term 'hyperesthetic rhinitis" to cover cases of rhinitis in which there is an element of hypersensitivity of the nasal mucosa," symptoms of excessive nasal discharge, excess sneezing and nasal obstruction It is difficult to perceive wherein these cases differ from those which have heretofore been grouped under the term 'vasomotor rhinitis" or "hay fever" Certainly it is unwise to introduce a new term into a field already distinguished by a multitude of ill defined conditions to which a confusing variety of names has been assigned

Appraisal of the effectiveness of anthallan from the treatment of the 42 patients who form the clinical material of this report is difficult The results are obscured by a complicated system of assigning numerical values to the symptoms of the patient, then averaging these and comparing these averages with those derived from similar numerical values assigned at the end of treatment The differences are expressed in percentage of improvement The elements which were assessed by this statistical process were the patient's statement about his symptoms, the color of the mucous membrane, the amount of breathing space and the amount of visible secretion in the nose In a masterly understatement the author admits that "numerical evaluation does not always express the whole clinical impression of the patient's condition " Therefore he assigns similar numerical values to a diagnostic criterion termed a "medical estimate '

This attempt to measure accurately factors which are not measurable is absurd The result of the statistical manipulations described is to make impossible any scientific appraisal of the effects, if any, produced by the drug The statement is made that "every change in the nasal manifestations observed during the period or treatment with anthallan can be attributed to the influence of the drug" The only justification for this statement appears to be that "the anthallan treatment period was considerably shorter than the period during which the manifestations had existed"

The laboratory studies reported included observations on red blood cell counts, white blood cell and differential counts, blood glucose, blood nonprotein nitrogen, electrocardiogram and nasal smear eosinophils Significant changes in these well recognized factors were not observed

Notably lacking in this report are parallel studies on control patients or, in fact, any controls whatsoever There does not seem to be any basis in the author s results for the recent newspaper and radio publicity given anthallan as a new "cure" for hay fever Until more convincing and scientifically controlled investigations are reported, the decision regarding the efficacy and value of anthallan must be deferred

## TOXICITY OF STREPTOMYCIN

Demonstration by Mushett [1] that parenteral administration of streptomycin to susceptible laboratory animals often produces fatty metamorphosis of the kidney and liver parenchyma led Hettig and his associates [2] of the University of Michigan to test its possible toxic effects on the renal, hepatic and hematologic functions of man

Nine patients ranging in age from 15 to 61 years served as his subjects A total dosage of streptomycin of 1.8 million units was administered in divided doses over a period of forty-eight hours or a dosage as high as 72 million units over a period of fifty-six days Six of the 9 patients received the antibiotic by intermittent intramuscular injections at intervals of three to four hours Two patients were given the drug by continuous intravenous infusion and 1 by continuous hypodermoclysis Renal and hepatic function tests were performed just prior to administering the first dose and within ninety-six hours of the final dose Two additional patients both desperately ill of tuberculous meningitis, received 3 to 7 million units of streptomycin before death Postmortem microscopic examination did not reveal any liver or kidney lesions that could be attributed to the action of streptomycin Impairment of hepatic or renal function was not detected by the series of bromosulfate, cephalin cholesterol flocculation and urea clearance studies Neither was a significant decrease of the hemoglobin or erythrocyte levels encountered in any case

Although evidence of serious organic toxicity was not obtained, undesirable reactions were recorded with certain patients These reactions were of two main varieties The first (2 patients) was characterized by facial flushing, headache and fall in blood pressure, a clinical picture resembling the classic response to histamine The second reaction (4 patients) consisted of

1 Mushett C W Personal communication (to be published)
2 Hettig R A. and Adcock J D Science 103 355 (March 22) 1945

fever, accompanied at times with myalgias and arthralgias. Skin eruptions appeared in 2 patients. Three patients showed slight local reactions consisting of pain and tenderness at the site of intramuscular or subcutaneous injection. The local reaction was alleviated by the local application of heat. Most of the undesirable reactions were apparently related to the amount of impurities retained in the preparations, fewer symptoms being recorded with the later, more refined preparations of the antibiotic.

The purified streptomycin is thus of such low toxicity as to be freely usable in human clinical medicine.

## Current Comment

### EFFECTS OF THE COLD WAVE PROCESS

Recently THE JOURNAL published an article referring to cases of poisoning associated by the author with the use of thioglycolic acid in the so-called cold wave process for permanent waving of the hair. In this issue of THE JOURNAL Dr. Carey P. McCord calls attention to certain facts which he believes were overlooked by Dr. Lawrence H. Cotter in his discussion of the cold wave process. Dr. McCord is convinced that it is the hydrogen sulfide which constantly evaporates from thioglycolic acid that is primarily at fault and that it is possible by the use of certain chemical processes to inhibit the creation of hydrogen sulfide in sufficient amounts to be harmful. Dr. McCord believes that damage to the liver by the use of these chemicals has not yet been definitely shown in any instance. He believes that allergic responses are infrequent when materials used are properly prepared. Notwithstanding these statements the fact remains that some fifty different commercial agencies are engaged in the manufacture of materials used in cold wave processes, that there exist no definite standards as to what is safe or harmful, that experimentation before launching such products is for the most part inadequate and incomplete and that it is time for public recognition of the fact that as much careful evidence needs to be accumulated regarding the safety of substances placed on the surface of the body as those taken into its interior before these preparations are released for use to the general public. An editorial entitled "Artificial Halo" published in the *Technology Review* asserts, after an analysis of the cold wave process that "... nothing is added, that is, nothing material, nothing except that immaterial and elusive something. She's gorgeous! She's enchanting! and so forth. Nothing is taken away, not even an atom. The original atoms have been coerced by chemistry into new arrangements giving the hair a new and enduring sinuosity." The editorial, written just about a year ago, would now seem to require some correction in the light of the fact that if not thioglycolic acid at least the hydrogen sulfide or some of the other chemicals associated with this process can be associated with severe allergic reactions in sensitive persons. The dosages of the materials concerned, the duration of exposure, the frequency of the exposure and many similar factors need study. The hair dressers and the employees of establishments in which the process is carried on constantly day after day are much more subject to the risk than the occasional user of materials purchased for application at home.

### CONTINUATION COURSES FOR VETERAN AND CIVILIAN PHYSICIANS

The semiannual listing of postgraduate continuation courses for veteran and civilian physicians prepared by the Council on Medical Education and Hospitals of the American Medical Association appears elsewhere in this issue. These courses begin during the period July 1, 1946 to Jan. 15, 1947. They cover a wide range of subjects, are extensively distributed geographically and vary considerably in duration. The number of courses offered continues at the expanded level of the preceding *six months period, with many more courses than were* given in former years. Many of the new courses were organized primarily to meet the needs of veterans, although most are also open to other physicians. Seventy-nine institutions and organizations are represented in this listing, offering 558 courses, some of which are given more than once in the period covered. Forty-seven medical schools give 491 courses, practically 90 per cent of the total. Many of these are full time and extend for relatively long periods. This invaluable contribution by medical schools was made possible in many instances by the actions of the Army, Navy and Selective Service System, which permitted medical school deceleration and thus freed facilities and faculty members for utilization in this manner. The usefulness of this listing is apparent from the demand for reprints, in addition to the wide distribution effected by the regular publication in THE JOURNAL. Requests for reprints are received at the rate of about one hundred and fifty a week, which is several times the number requested before the war. Institutions and individuals participating in these programs are rendering a great service to the returning medical officers. THE JOURNAL and the Council are indebted to them for making these listings possible.

### VITAMIN E AND HEART DISEASE

Announcement in newspapers and particularly in *Time* that large doses of vitamin E will bring relief from all common forms of heart disease once again prompts discussion of the manner in which the results of medical research should be brought to the attention of the public. Far too often of late there has been overemphasis in the popular press on research too fresh from the laboratory and too inadequate as to evidence to permit evaluation. The reported discovery of new and almost miraculous powers of vitamin E needs careful evaluation and confirmation because the substance had already been investigated by many competent clinicians and found wanting. Nothing in the known pharmacologic actions of vitamin E would lead one to suspect either a vasodilating action, a myotonic effect or an *ability to repair damaged heart muscle in human* beings.

### NAVY AWARDS AND COMMENDATIONS

#### Captain William Edward Eaton

Capt. William Edward Eaton, Washington, D C, was recently awarded the Legion of Merit "for exceptionally meritorious conduct in the performance of outstanding services to the government of the United States as medical officer in command of the United States Naval Hospital Great Lakes Ill, during the early part of World War II Displaying exceptional initiative judgment and professional ability," said the citation, Captain Eaton expertly administered the activities of his command in treating the sick and handling epidemics in this institution and throughout the Ninth Naval District and was in a large measure responsible for the expeditious return to duty of a large number of patients In addition, he directed the establishment of a hospital corps school which trained thousands of hospital corpsmen, including Waves to meet the needs of the rapidly expanding Navy, and conscientious devotion to the varied and complex details of his assignment reflect the highest credit on Captain Eaton and the United States Naval Service." Dr Eaton graduated from Harvard Medical School, Boston, in 1905 and entered the service Oct 15, 1910 He is now on duty at the Navy Department, serving as a member of the Board to Revise Navy Regulations

#### Lieutenant Commander John P Martin

Lieut. Comdr John P Martin Camden, Del, recently received a commendation from Fleet Admiral Chester W Nimitz, commander-in-chief of the U S Pacific fleet, the citation reading "For meritorious conduct while participating in aerial flights as flight surgeon of Carrier Air Group Twelve, attached to the U S S *Saratoga* from Jan 31 to Feb 11, 1944 In order to obtain a better understanding of pilot fatigue under actual combat conditions, Lieutenant Commander Martin requested permission to take part in strikes against the enemy Permission was granted and he subsequently took part in five separate overwater strikes against enemy installations on Eniwetok Atoll Through his outstanding desire to improve his professional knowledge, and courage in accompanying the air crew on these hazardous missions beyond the requirements of his naval status he contributed materially to the physical and mental welfare of the pilots and the successful operations of Carrier Air Group Twelve. His courageous conduct and devotion to duty were at all times in keeping with the highest traditions of the United States Naval Service" Dr Martin graduated from New York University College of Medicine New York, in 1932 and entered the service March 17, 1941

#### Commodore Carlton L Andrus

Commodore Carlton L. Andrus Arlington Va, was recently awarded the Legion of Merit for exceptionally meritorious conduct in the performance of outstanding services to the government of the United States as officer in charge of the War Plans Division Bureau of Medicine and Surgery throughout World War II" The citation accompanying the award continued Qualified for his work by thorough experience in hospital construction, Commodore Andrus rendered invaluable service in expanding the Navy's major medical facilities from sixteen hospitals to sixty and in providing an adequate number of general, special and convalescent hospital beds to insure the highest standard of care for personnel of the Navy, Marine Corps and Coast Guard His skill and initiative were essential factors in developing our mobile, Fleet evacuation and base hospitals and in improving the design of medical and surgical facilities and professional ability Commodore Andrus contributed to the success of our country s war effort and upheld the highest traditions of the United States Naval Service ' Dr Andrus graduated from Stanford University School of Medicine, San Francisco in 1917 and entered the service Jan 1, 1918

#### Commander George H O'Kane

Comdr George H O Kane, New York, was recently awarded a special commendation ribbon for service with the Pacific Fleet Accompanying the award was a citation reading For meritorious service in the line of his profession as surgeon and specialist aboard the United States Hospital Ship *Solace* from Nov 21, 1944 to Sept. 1, 1945 Commander O'Kane displayed outstanding ability and sincerity of purpose in caring for the sick and wounded and contributed directly toward saving many lives and alleviating suffering His professional excellence, mature judgment and devotion to duty were material contributing factors in the successful prosecution of the war against the Japanese Empire and were in keeping with the highest traditions of the United States Naval Service." Dr O'Kane graduated from the University of Rochester School of Medicine and Dentistry in 1931 and entered the service April 6, 1942

#### Rear Admiral Benjamin H Dorsey

Rear Admiral Benjamin H Dorsey, U S Navy, retired, Washington, D C, was recently presented with the Legion of Merit 'for exceptionally meritorious conduct in the performance of outstanding services to the government of the United States as president of the Navy Retirement Board and president of the Board of Medical Examiners of the Navy, prior to and during World War II Demonstrating a thorough understanding of critical problems," continued the citation, 'Rear Admiral Dorsey was personally responsible for the expeditious handling of medical examinations and retirements for the Navy His medical competence, long naval experience and sound judgment were important factors in the successful prosecution of a task of great magnitude and importance to the United States Navy" Dr Dorsey graduated from the University of Maryland School of Medicine and College of Physicians and Surgeons, Baltimore, in 1901 and entered the service March 13 1903

## MISCELLANEOUS

### BETTER PROSTHETIC DEVICES NEEDED

Dr Paul E Klopsteg chairman of the Committee on Prosthetic Devices recently urged inventors and engineers of artificial limbs to submit ideas and suggestions for better prosthetic devices to the National Inventors Council, Department of Commerce, Washington, D C., for analysis and screening He stressed the urgent needs of 17 000 war amputees and an estimated annual minimum of 25,000 civilian amputees

The Committee on Prosthetic Devices was set up in April 1945 under the sponsorship of the National Research Council of the Office of Scientific and Research Development Consisting of three orthopedic surgeons and three engineers, the committee initiates, supervises and lends financial support to research institutes and laboratories willing to undertake special research problems for improving prosthetic devices Members of the committee have prepared a report especially for engineers and investors, summarizing its work over the past year and analyzing problems as yet unsolved. A mimeographed copy of the report will be mailed free of charge on request to the National Inventors Council

The National Inventors Council is cooperating with the committee by soliciting and screening ideas, suggestions and inventions for improving prosthetic devices Proposals submitted to the council by engineers and inventors are carefully analyzed If found meritorious they will be forwarded to the Committee on Prosthetic Devices for further investigation and development Such proposals should be addressed to John C Green Chief Engineer National Inventors Council, Department of Commerce Washington, D C

## Medical Legislation

### MATERNAL AND CHILD WELFARE LEGISLATION

The Subcommittee on Aid to the Physically Handicapped, House Committee on Labor, recently held hearings on three identical bills proposing to enact a Maternal and Child Welfare Act. These bills are companion measures to the legislation sponsored in the Senate by Senator Pepper as S. 1318.

Senator Pepper was the first witness and presented arguments similar to those he gave at the hearings on S. 1606 in support of amendments he offered, the effect of which would be essentially to add the provisions of his own bill, S. 1318, to the Wagner-Murray-Dingell bill.

Two representatives of the Children's Bureau testified in support of the legislation. Katharine F. Lenroot, chief of the bureau, and Martha M. Eliot, M.D., associate chief.

Miss Lenroot devoted most of her time to discussing the different phases of the problem presented by the delinquent child and the government's responsibility. Under the proposed legislation, she said, it would be possible for each state, with federal and state funds and local funds in some instances, to provide services in the public welfare department that would be available whenever a child needed help. The needs of these 'socially handicapped' children would be met through the services of well qualified child welfare workers who would bring to bear on their problem all the available resources of the community both public and private. Besides providing for the services of those workers, federal funds would also be available for strengthening the resources of the community for the care of children in foster homes and for other specified types of care. The proposed legislation, she pointed out, would keep federal responsibility in the Children's Bureau, thus continuing to make possible general planning and adequate correlation of maternal and child health and child welfare services to the end that they may effectively meet the needs of children. 'Their lives cannot be divided into separate water tight compartments labeled 'health' and 'welfare.' They must be viewed and served as living, growing human beings,' she said.

Dr. Eliot pointed out that under the provisions of the legislation the state would have to meet certain requirements to be eligible for federal financial participation but expressed the opinion that the actual determination of how the program is to be undertaken and what is to be done at any particular time will be the responsibility of the state agency. She emphasized that in order that the best results should be achieved all health "services must be accessible to every individual with no economic barriers to their use or discrimination on account of race, color, creed, national origin or residence. There must be a sufficient number of trained professional people to make it possible for this kind of service to be made available."

Mrs. Agnes Meyer, wife of the publisher of the Washington *Post*, was another witness. She attacked the administration of the Children's Bureau, charging that 'during the war the Children's Bureau neglected its own important and fundamental reason for existence since all of its spare energies went into the administration of emergency programs." She argued in favor of the President's plan of transferring the Children's Bureau to the Federal Security Agency, contending that leaving it where it is results in much duplication, duplicate state plans, duplicate reports, duplicate budgets and duplicate supervision and audits. She feared she said that if the legislation under consideration was enacted it "could potentially result in the creation in the Children's Bureau of a Health Division larger than the Public Health Service and a Welfare Division larger than that of the Social Security Board."

Dr. Joseph Wall of Washington, D. C., and Dr. Joseph Howard of Bridgeport, Conn., appeared for the American Medical Association. Dr. Wall presented a careful analysis of the provisions of the legislation, pointing out weaknesses. He enumerated the instances where the legislation would give specific authority to the Children's Bureau which would violate the autonomy of the individual state. He called attention to the fact that the bureau would have authority for developing an extensive code of regulations which would carry the authority of the law. He said "The state is commanded to construct 'standards for professional personnel rendering medical, dental, nursing and related types of care or services, such standards to be established by the state health agency.' E.M.I.C. and other experiences prove beyond peradventure that the Children's Bureau and not the state agencies have heretofore established such standards for professional personnel and for hospitals." In speaking of remuneration he said "Who is to establish what is to be considered as 'adequate remuneration'? Past experiences with governmental experimental medical practice indicate that remuneration will be far from adequate and that the fee schedules will be established by bureaucratic edicts which will remain as immutable as the laws of the Medes and Persians and that they will be fixed by remote control almost as distant from some state localities as Iran itself."

Dr. Wall expressed the conviction that the legislation "merits the unanimous disapproval of the medical profession, the members of which, obviously, will be commandeered to become the purveyors of medical care to all who will 'embrace the benefits of the program.' Those physicians who do not 'choose to participate will be left to their own resources to survive or perish in competition with government practice fortified with the bait of free service dangled before the consumer in the form of a federal dole.'

Dr. Howard presented a statement drafted largely from his experiences under the E.M.I.C. program and studies he has made of conditions in other states and countries. He accompanied his statement with a graph showing that the maternal deaths in the present century reached their peak about 1918 and since then have been uniformly decreasing with the exception of a slight interruption in 1927. He said "The United States is a young country. Previous to 1930 the maternal mortality rate remained rather constant in most countries. In 1936 a sharp drop occurred chiefly in the United States, Switzerland, South Africa, Mexico, Scotland, New Zealand, Eire, Australia, Canada, England and Wales. This may have been due to a wider use of transfusions and the introduction of the sulfonamide drugs, but strangely enough the reduction was evident not only in cases of infection and hemorrhage but also in toxemias. This reduction has continued at a more rapid rate in this country than in others." During the ten year period from 1933 to 1943, he continued, "maternal mortality in the United States declined 60 per cent, from 61.5 deaths per 10,000 live births directly due to pregnancy in 1933 to 24.5 in 1943. No other country has made such progress. These figures are more striking when we realize that in this same period there was an increase in births of 30 per cent. The rate for all obstetric deaths was reduced 60.4 per cent, from infection 62.6 per cent, from toxemia 57.8 per cent, from hemorrhage and other causes 59.9 per cent. In 1940 only two states in the United States had maternal mortality rates less than 2.5, in 1942 twenty-nine states had achieved this position. In 1933 Florida had the highest rate, 115 per 10,000 live births. Idaho had the lowest, 43 per 10,000 live births. In 1943 New Mexico was high with 47, which was only slightly higher than the low record of Idaho ten years before—Oregon and Minnesota shared the low record with rates below 15. During these ten years every state has shown a definite reduction, the smallest being 41 per cent in North Dakota and the largest being 76 per cent in Nevada."

In concluding, Dr. Howard stated, "The medical profession is vitally interested in good maternity care for all women. We are proud of the reduction in maternal mortality in our country, a record not exceeded by any other country. We believe that this reduction will continue under the present system of medical

care. We believe that aid should be extended to those states not financially able to carry on an efficient maternal and child health program

'We do not believe that services and facilities should be available to all who elect to participate regardless of economic status We do not believe that authority for such a vast program should be vested in the chief of the Children's Bureau, who would have power to (1) veto any state program and cut off federal aid, (2) force adoption of Children s Bureau standards of medical care and administration and (3) establish maximum remuneration for all professional participants'

Dr V A Getting, testifying as secretary of the Association of State and Territorial Health Officers expressed opposition to the legislation in its present form and submitted a number of amendments 'It is the opinion of the Association of State and Territorial Health Officers' he said "that state health departments are not prepared to undertake a medical care program for maternal and child health unless consideration is given to their ability to expand and participate The association therefore recommends that the bill be modified to permit a gradual development of the program over a period of years, limiting it in the first year to children under 1 year of age and extending it by the tenth year of operation to include all children up to the age of 18 years Preventive, diagnostic, school health and related facilities would necessarily be made available to all children.' He emphasized the need for a coordinated federal health program 'Duplicate reports audits and other inefficient operative procedures could be eliminated,' he said, by the unification of the Children s Bureau of the Department of Labor, the U S Public Health Service of the Federal Security Agency and other agencies of the federal government dealing with public health into a single department of public health or of public health and welfare under the direction of a cabinet secretary"

Dr C L Palmer and Dr James S Taylor testified for the Medical Society of Pennsylvania in opposition to the legislation, but their testimony is not available for condensing

## FEDERAL MEDICAL SERVICES

President Truman Dec 12, 1945, appointed a Committee on Integration of the Medical Services of the Government to make a study of the medical care provided by various governmental services and to make recommendations for improvement and for changes in basic policy[1] The report of the committee, released June 18 is divided into two broad divisions, part I relating to medical service in the Veterans Administration and part II dealing with the broader problem of the desirability of integrating all government medical services

Concerning part I the report, among other things approved the principle of making use of community medical and hospital care for veterans with service connected disability, and it recommended that outpatient care be made available to veterans suffering from non-service disabilities President Truman, however, in transmitting the report to the Bureau of the Budget, expressed opposition to this recommendation In the main, the committee expressed the belief that the procedures authorized and being carried out under the law enacted in December of last year establishing a Department of Medicine and Surgery in the Veterans Administration will result in a better quality of medical care for veterans

Under part II the committee pointed out that the present method of providing medical care by a system of parallel government agencies is considered by many informed persons to be inefficient ineffective and extravagant. Each agency, the committee observed, for all practical purposes now acts as a separate unit resulting in competition for and duplication of personnel and facilities and discouraging their economical and effective utilization. Before there can be an effective reorganization the committee believes that a complete and exhaustive survey of current medical resources is necessary, then a plan can be formulated to provide an integrated and improved system of medical care for the armed forces, the veterans and other charges of the federal government. This conviction was reemphasized in the concluding paragraph of the report

> In conclusion the Committee wishes to repeat its firm conviction that the existing situation in respect to the medical services of the government calls for a thorough and bold restudy It believes that a comprehensive report on the methods of gearing together the federal medical services is not possible until a detailed and painstaking examination of all the problems involved has been completed It is recommended therefore that funds be provided to make possible an authoritative study by a selected committee with adequate staff in order that a report setting forth specific recommendations based on a thorough survey of all factual data may be available as soon as feasible

President Truman in his letter to the director of the Bureau of the Budget, concurred in the foregoing committee recommendation and requested the director to suggest the names of outstanding medical men to serve on a committee to make the study He felt, however that the study should be delayed until after the Army-Navy merger issues are resolved

An intelligent, impartial survey, as contemplated in the committee s recommendation, would seem to represent a scientific approach to the problem involved, an approach not infrequently lacking in suggested governmental programs in the field of medical care

## STATE LEGISLATION

### Louisiana

*Bill Passed*—H 257 passed the house June 7 It proposes that the director of experiment stations of Louisiana State University and Agricultural and Mechanical College be recognized as the state chemist with all the rights conferred and all the duties and obligations imposed on that office

### Massachusetts

*Bill Passed*—H 1822 passed the house June 13 It proposes that any applicant for a license to practice a profession who has served in the armed forces of the United States during World War II shall be subject only to educational and experience qualifications required prior to Sept. 16, 1940

*Bills Enacted*—H 2001 has become chapter 82 of the Resolves of 1946 It increases the scope of a special commission investigating certain matters relating to public education relative to changing the name of the Massachusetts State College to the University of Massachusetts and to establishing a medical school at that institution H 2029 has become chapter 517 of the Laws of 1946 It provides that any container containing DDT be labeled in certain ways so as to protect the purchaser from being poisoned thereby H 2060 has become chapter 524 of the Laws of 1946 It prohibits the removal of nurse employees of the department of mental health, public health, public welfare or correction, who render professional service, except for just cause after such person has served satisfactorily for six months in his position. S 44 has become chapter 93 of the Resolves of 1946 It authorizes the department of public health to investigate and study the causes of poliomyelitis, commonly called infantile paralysis, and the eradication of such disease. S 426 has become chapter 511 of the Laws of 1946 It authorizes the construction of an 800 bed hospital for the care of persons suffering from chronic diseases S 533 has become chapter 71 of the Resolves of 1946 It provides for a departmental study relative to the regulation of certain hospitals, sanatoriums, convalescent homes and nursing homes by the department of public health

June 24, 1946

## Atom Bomb Plant to Turn Out Materials for Medical Research

The War Department announced that atom bomb plants will soon be turning out radioactive isotopes for use in medical research in hospitals and universities An isotope is a variation of the chemical atom which has atomic weight and physical proportions differing from the original element. It can be produced by bombarding the original atom with other atom particles Scientists say there are more than 400 varieties The radioactive isotope uranium 235 was used in making the atom bomb Isotopes to be made for medical research include those of such elements as carbon, sulfur phosphorus and iodine. The Army indicates that the isotopes can be used for medical research in two ways (1) as tracers to follow bodily processes such as growth of tissue, either normal or malignant, and (2) "possibly, after considerable research" as direct therapeutic agents for treatment of specific diseases The radioactive form of sulfur can be used to trace the reaction of the sulfonamides on the human system and radioiodine can be used to study thyroid functions To check for the presence of tumors or cancers the radioactive elements can be administered in minute amounts in a glass of water As radioactive materials tend to congregate in affected areas, they can be readily seen through x-rays The atomic material will undergo mass production at the Clinton Laboratories in Oak Ridge, Tenn, operated for the Army by the Monsanto Chemical Company Some isotopes were available from cyclotrons before the war in limited quantities

## Work of Voluntary Agencies Criticized by Health Survey

The Metropolitan Health Council, a division of the Council of Social Agencies charges in its eighteenth report that there is a serious gap in the work of Washington voluntary health agencies in control of cancer, heart disease and mental diseases The report cited a lack of community programs in nutrition, dental health and year round public health education On the brighter side the survey reports an increased public interest in health matters, good work by active medical and dental societies and many well organized health agencies, including the Metropolitan Health Council, which made the survey

## Fifteen Seventh Day Adventist Sanatoriums Treat 60,000 Persons

Dr H M Walton secretary of the Seventh Day Adventist Church medical department, reported to the forty-fifth general session held in Washington that 60 000 persons had been treated in the fifteen Adventist sanatoriums in North America Dr E. L. Morel, who has served for twelve years in the South African colony for the leprous, reported that half of the patients admitted were disposed of as "arrested cases" after four years He said "we don t say lepers are cured any more than we say tuberculous cases are cured, other than that no leprosy germs can be determined microscopically '

## Prediction of Heavy Death Toll From Traffic

Franklin M Kreml, director of the Northwestern University Traffic Institute, informed the International Association of Police Chiefs board meeting here that in the next ten years the United States will suffer half a million deaths, 15 million injuries and 1½ million crippling injuries through automobile accidents unless a determined program of traffic control is adopted and followed by the public

## Advocacy of Intensified Cancer Research in House

A House of Representatives committee has granted a request by the U S Public Health Service for $1 772 000 to finance cancer research The disease kills more than 170,000 Americans annually The committee endorsed an intensified attack on cancer, recommending a budget more than double current funds This years appropriation for the work is $548,700 Dr Warren F Draper deputy surgeon general told the committee that cancer ranks second as a cause of death in this country Between Pearl Harbor and V-J day it killed 600 000 Americans, more than twice the number listed as dead or missing in action by the armed forces during the war In the Federal Security Agency appropriation bill for 1947 the Public Health Service also asked for a fund to make larger grants to private research organizations, $500,000 for next year as compared with $75,000 this year Meantime a Gallup poll reports that 87 per cent of persons interviewed approved having the Government spend 100 million dollars to find ways of preventing or curing cancer, and 72 per cent were willing to pay more taxes to provide the money The committee on gastric cancer of the National Cancer Advisory Council, meeting at Bethesda, Md, discussed research projects to be instituted A report by the Metropolitan Health Council, a division of the Council of Social Agencies, charges that the District of Columbia chapter of the American Cancer Society is 'chiefly a paper organization"

## Psychiatric Association Criticizes Changes at St Elizabeths Hospital

Exclusion of military patients from St Elizabeths Hospital in Washington, as proposed in President Truman's reorganization plan, was criticized by Dr Ross Chapman, past president of the American Psychiatric Association Testifying at a hearing before the House Committee on Expenditures of the Executive Departments, he said the association is "deeply disturbed" at the idea of discontinuance of the hospital at a teaching center Dr Chapman said that through its accomplishments in clinical medicine and research the hospital has become "an institution of national significance"

## Research Being Resumed in Pacific Areas

Research, especially in biologic and medical fields, is being resumed throughout the Pacific islands, it was revealed at a conference of seventy-five scientific leaders and governmental representatives at the National Academy of Sciences The war and the presence of Japs on many islands disrupted research programs to the extent that sixteen insects dangerous to plant and animal life have been introduced into Hawaii Scientists are mapping extensive field work through a chain of field stations Army installations will be used, with a start at New Caledonia, where the French government is cooperating to make facilities available to scientists of all nations

## Investigating Board Clears Medical Staff of Ship Zebulon B Vance

An investigating board has reported to the War Department that "lax sanitary methods employed by mothers" may have contributed to deaths of 8 baby patients brought to this country from Europe on the "bride ship" *Zebulon B Vance* The report stated that "no misconduct or neglect on the part of the medical staff aboard the vessel contributed in any way to the cause or spread of the illness nor were any members of the medical staff intoxicated at any time during the voyage, as alleged by several of the passengers"

## New Mobile X-Ray Unit Used by Secretary of Agriculture

Secretary of Agriculture Clinton Anderson was the first person to undergo examination in the U S Public Health Services new mobile x-ray unit, the test showing a healed tuberculous condition The equipment is intended for mass tests of large groups of persons Dr C L. Williams of the Public Health Service predicted disappearance of tuberculosis "within a generation" in accepting the unit from the General Electric X-Ray Company on behalf of Surg Gen. Thomas Parran

## Senate Approves National Institute of Dental Research

The Senate has approved and sent to the House a bill to create a National Institute of Dental Research within the U S Public Health Service with a $2,000,000 building at Bethesda, and funds for research on dental decay and how to combat it. Reporting the bill the Senate Education and Labor committee said that 75 per cent of the people neglect their teeth, and only 25 per cent get "anything like' adequate or regular dental care.

# THE WAGNER-MURRAY-DINGELL BILL

## Hearings on S 1606—To Provide for a National Health Program

(NOTE.—*This is a condensation of the verbatim report of the hearings*—ED.)

*(Continued from page 692)*

United States Senate Committee on Education and Labor

MAY 6 1946

HONORABLE JAMES E MURRAY Presiding

PRESENT Senators Murray and Donnell

### Statement of Rev R A McGowan Director Department of Social Action, National Catholic Welfare Conference

REV FATHER MCGOWAN The Bishops' Program of Social Reconstruction, issued twenty-seven years ago just after World War I urged social security not only against unemployment and old age but against sickness and disability

In order that any national health program can become effective the following requirements are essential

(*a*) There must be an extension of hospital facilities by means of government support or subsidy for hospital construction particularly in the areas sparsely settled and in the areas of low per capita income There can be no extension of services without facilities to implement the program. This proposal is now under consideration by Congress

(*b*) There must be a notable extension of public health centers for the prevention of illness This phase of the program requires federal appropriation and administration and is included in title I of this bill

(*c*) There must be provision for adequate medical and nursing services in areas where such services are now insufficient. Private or voluntary effort will not place doctors or nurses where most needed. Some form of government aid will be required for this purpose. We suggest consideration of this That in such areas a policy of granting government commissions to selected physicians for civilian service on at least a part time basis be carefully explored and also the idea of using the services of physicians attached to the military services

(*d*) There should be federal support or subsidy to the states on a matching basis to provide care for the medically dependent who are entitled to public assistance This too is in title I

(*e*) There should be subsidies granted by the federal government to qualified colleges and universities for medical research

We favor the establishment of a national health program which will provide both hospital and medical care for the citizens of our country We recognize that the voluntary systems of health insurance which have rendered excellent service to our people would require some form of government aid to achieve universal health security

We favor in consequence a national system of insurance supplemented by government tax revenues by means of which all citizens can be protected in matters of health but we consider that this bill as presently drafted is unsatisfactory because of the complicated methods of administration which it creates and because of the excessive governmental control over the health services which are to be provided

Rights of patients doctors nurses hospitals and private health insurance organizations must be protected for the success of the program We do not doubt the intention of the writers of this bill to protect these rights We think that they have gone far in stating these rights But we are still dubious We are dubious about the method of administration

(*Rev Father McGo can suggested many modifications of the proposed legislation*)

SENATOR MURRAY Father am I correct in my understanding of Catholic social thinking in saying that the key thought is the importance and dignity ascribed to the human personality? REV FATHER MCGOWAN Yes, Senator

SENATOR MURRAY Do you believe that a means test, making people dependent on public charity would detract in any manner from that dignity of the human personality? REV FATHER MCGOWAN Yes I think it would Under this bill, which is quite extensive that is not provided

SENATOR MURRAY You think that any system which would provide for any section of our population to take a paupers oath would not be in accordance with good sound Catholic thinking? REV FATHER MCGOWAN Not for health purposes at all no

SENATOR MURRAY Has the church taken any stand during the past century when these problems were being agitated in other parts of the country with reference to systems of insurance, health insurance? REV FATHER MCGOWAN I do not think there has been any formal statement but there certainly has been great encouragement of the private health insurance systems I made the statement in here, however on the matter of advocacy of public health insurance by the Bishops Program years back

SENATOR MURRAY Pope Pius XI, in his Encyclical on Atheistic Communism, dated March 19, 1937, gave his approval and encouragement to a system of insurance against illness did he not Father? REV FATHER MCGOWAN Yes In paragraph 52 of that encyclical he has something on it I will read the whole sentence But social justice cannot be said to have been satisfied as long as working men are denied a salary that will enable them to secure proper sustenance for themselves and for their families as long as they are denied the opportunity of acquiring a modest fortune and forestalling the plague of universal pauperism as long as they cannot make suitable provision through public or private insurance for old age for periods of illness and unemployment.

SENATOR DONNELL I had not seen the Bishops' Program of Social Reconstruction until this morning and I have hastily sketched portions of it while you were testifying although of course I could not assimilate it all in the few moments I have had I observe at page 8 this language The social insurance provided in the Social Security Act is by no means perfect. To say nothing of other defects it fails to provide for workers' insurance against sickness ' Do you understand, Father that that language necessarily means an advocacy of compulsory health insurance of the type under which services medical and surgical services are provided as distinguished from insurance benefits in cash? REV FATHER MCGOWAN No I do not believe that a person could get from that advocacy of either method

(*There was extended discussion of monopolies and minimum wage laws*)

SENATOR DONNELL Mr Chairman, I was not in this questioning primarily addressing myself to the probabilities of economic development in the country but rather to undertake to determine what is exactly the theory of the Bishops Program and as I understand it to quote again this sentence

Hence all forms of state insurance should be regarded as merely a lesser evil and should be so organized and administered as to hasten the coming of the normal condition ' I think that indicates the thought of the writer or writers not that state insurance is itself a positive good but that as it is stated here it should be regarded as merely a lesser evil REV FATHER MCGOWAN Yes

SENATOR DONNELL Now Father McGowan you are not as pessimistic as the chairman as to the arrival at an improved condition which would obviate the necessity of this type of insurance? I am correct in that, am I not Father? REV FATHER MCGOWAN Yes

SENATOR MURRAY I understood you were. REV FATHER MCGOWAN Not so pessimistic.

SENATOR MURRAY You think it may come within the next century? REV FATHER MCGOWAN Well, I hope so

### Statement of John H Hayes, President-Elect of the American Hospital Association, Accompanied by Mr George Bugbee, Executive Director of the American Hospital Association

MR. HAYES The American Hospital Association represents approximately 3 500 hospitals comprising about 85 per cent of the civilian general hospital bed capacity of the nation We also have as members a substantial number of city county, state and federal hospitals We do not appear before you as a commercial group with a vested interest in any present organization for distribution of hospital care We are not under this bill threatened with taxes increased costs or great financial losses Hospitals occupy a unique position in the social structure of America Nearly every hospital performs a substantial amount of charity work, and by far the majority of hospitals

are operated by organizations who do so for the sake of rendering service and not for making a profit

We appear rather as a group having the greatest fund of experience in the administrative aspects of making hospital care and thus medical care available to the sick Hospitals are organized as representatives of the public to provide the skilled personnel and technical facilities needed by physicians and surgeons in rendering care to their patients We who administer hospitals for the benefit of society do so with a strong sense of our responsibility as public servants

We do not claim to have solved all the problems incident to the proper distribution of hospital and medical service. But hospitals have carried a large part of the development of the present high quality of such care in America, and it is therefore our duty to be in the forefront in supporting any program which might bring progress in our field and to lend our voice in opposition to any program which might imperil such progress or impede its further development

As a group we endorse the aims of a program of federal grants in aid to the states to make hospital and health care available to those who cannot pay for it In previous appearances before your committee the American Hospital Association has advocated such measures for indigent care, and to this extent we endorse in general the aims of that part of title I which would make such provision However were any portion of such legislation to be recommended for passage it should be carefully studied, bearing in mind the need for state participation and responsibility decentralization of authority and proper limitation of federal authority But we vigorously oppose the provisions of title II of this legislation, which would place the federal government in such a dominant position in the health field as to lead inevitably to federal control and operation of the entire health system of the nation This bill would give a federal agency complete control of practically all the funds needed to pay physicians hospitals, nurses dentists and others who render care to the sick. Control of the purse strings means control of the program, and we think this is highly dangerous

The development of health care in this country has not followed any fixed pattern Yet nowhere in the world has it made greater progress Literally billions of dollars have been donated by churches, philanthropic organizations, public spirited citizens and various community groups to build hospitals to provide care for the people of this nation Benjamin Franklin was one of the trustees of the first voluntary, nonprofit hospital in the United States and the hospital he helped to found is still in operation as a monument to the civic interest of this great American genius Since that time outstanding citizens in every section of the country have been members of boards of trustees of hospitals in their local communities in recognition of the importance of the hospital to the people of the area These tens of thousands of trustees are the representatives of the general public, organized to supervise the policies of the hospital with respect to the needs of the individual community and to see that the institution renders its fullest measure of service to its citizens Representatives of our various church groups have fulfilled a similar purpose in operating hospitals in areas where they were needed

Within the walls of hospitals in every part of the nation thousands of physicians nurses, hospital administrators and other personnel have individually and collectively contributed to the development of a system of hospital and medical care which draws very little criticism except that there is not enough of it The strength of this system is that it has grown and is continuing to grow according to the needs of the people it has served It is rooted in many soils and has developed along various lines Today's health care system is a living, growing organism which is instantly adaptable to the latest scientific discoveries to the needs of the community or to the individual patient

We are keenly aware of the fact that the amazing development of hospital services over the past two generations has been the result of those incentives which are found only in a free and independent professional group devoting their whole attention and interest to their efforts to be of service to society

If control of the funds of a compulsory health insurance system is placed in the hands of the federal government, the continuing growth of our present system, which has brought such progress will be seriously affected, because administratively the federal government will have to adhere to a single pattern of providing care If our present system had been developed in a single pattern this might be less difficult. But it has not and we have no reason to believe that the federal government will be able to determine such a pattern. Nevertheless, if this legislation be enacted those who administer the law will be obliged to establish some pattern at once. And they will be in position to enforce that pattern—right or wrong—through complete control of funds The terrible inertia of government regulation could easily retard further development of health care in America

Therefore as a group, on the basis of our experience, we are opposed to the legislation which you are considering because it would put the federal government into the position of controlling the whole health field We regard this legislation as a dangerous violation of all that has been learned in the administration of hospitals In a nutshell, hospital and medical care is a personal service, and the more remote the control, the worse the service Please understand that we do not condemn all government activity in the hospital field, for government has had an important part both on federal and on local levels But we cannot believe that the answer to the health problem of our country is to place the federal government in the position of collecting and dispensing practically all the funds needed to pay physicians, hospitals, dentists, nurses and others who supply care to the sick

We are further opposed to this legislation because it has been our experience that government in the health field is seldom able to control its cost of service and, on the other hand is likely to promise greater benefits than funds will permit Between a steadily rising cost of benefits and an increasing demand for more of such benefits the government would soon begin to operate under tremendous financial pressure We do not believe that the potential demand of this program on the taxing power of the federal government has been fully evaluated Certainly this may become one of the most expensive programs the federal government has ever undertaken and the responsibility to be imposed on the federal government for meeting such broad promises to the American people is not easily comprehended

The whole problem of purchasing hospital and health service is still developing Under S 1606 the federal government would be almost the sole purchaser of such service We do not believe it is realistic to assume that the system proposed by this legislation would long continue. Steadily increasing costs arguments as to various methods of rendering such care in different hospitals, would lead to such criticism of the program that the federal government would be constantly taking steps to meet such criticism However, these pressures would be such that before very long the government would be controlling the whole system by regulation, and government operation would be inevitable

State and local governments in their operation of hospital facilities have found no easy answer to these financial pressures In most cases such government institutions offer only minimal and impersonal service The federal government itself has been subjected to much criticism for faulty operation of its own hospitals Its experience in hospital operation is not such as to encourage us to believe that government operation of hospitals will improve the quality of hospital service or reduce its cost.

The sponsors of this legislation do not believe that its compulsory health features will lead to government operation, and they have repeatedly so stated Nevertheless we firmly believe that the pressure for increasing benefits, coupled with rising costs of such benefits, will not only lead to government operation but will further result in serious deterioration of the quality of service, because of the inadequacy of funds Government control of funds will greatly change present incentives for quality of medical and hospital service Quality, under such conditions will be sacrificed for quantity This financial pressure will require detailed control of those to whom funds are paid There is grave danger that imposed standards and sweeping regulations may supersede the present cardinal rule which places the welfare and comfort of the individual patient above all other considerations This control by regulation will have to be established within the range of the average hospital The process of averaging may result very logically in improving the services of substandard hospitals but it will also almost certainly result in the elimination of our present higher cost hospitals This will strike directly at our teaching hospitals and those which now render distinctive service Will this not mean the elimination of leadership in the hospital field? The sponsors of this measure completely overlook the sources of hospital progress

We are fearful of this legislation too because it makes promises which are impossible of fulfilment For example, there are now in this country approximately 130 000 active physicans These men, as you know, seldom work regular hours However, it is reasonable to assume that under a federally controlled administration these physicians like other government employees, would fall back into a five day forty hour week Allowing for the usual two weeks' vacation we find that fifty weeks of such service would make two thousand

hours of medical service available from each physician in a year, and a total of 260 million hours a year from the whole profession Since we have a population of over 140 million people this is less than two hours of medical service a year for each individual In other words, there are not enough physicians in the country right now to provide even two complete physical examinations a year for each citizen The normal output of our medical schools is approximately 5,000 physicians annually which is barely enough for replacement needs If the output was increased to 10 000 a year it would require twenty six years to double our physician census In the meantime, should this bill suddenly become a law the overwhelming load thrown on our medical profession would result in the lowest standards of medical care this country has ever known It is our feeling that the proponents of this legislation have not taken these facts into consideration in their discussion of the vast benefits to be afforded the nation immediately on passage of this bill

As a matter of fact, in all the years during which we have had a social security system in operation in this country a large portion of the employed population is still not covered by present benefits Yet here is proposed a much more complex program which is being promised to the entire population In view of the still partial acceptance of social security provisions, we are unable to envision the establishment of a universal compulsory health program which would even in the distant future accomplish all of the things which are promised

We are fully sympathetic with the aims of those who would like to have more medical and hospital service available to more people That is also one of our aims However we do not believe it can be widely and effectively accomplished in one bold stroke Rather, we believe it requires an orderly, intelligent program which will be more closely integrated to the needs of our people. It takes eight years to train a physician Hospitals can be built more rapidly, but it also takes time to develop the highly trained personnel necessary to provide our citizens with the high quality of hospital service they have come to expect and desire when they are sick Enactment of S 1606 as it is at present drawn would not correct our basic shortages in facilities and personnel Rather it would intensify the existing shortages in facilities and personnel and create confusion by its unrealistic approach to the whole health problem Indeed we believe that the assignment of ultimate authority in the health field to the federal government might well retard its further development because of the stultifying effects of remote control and administration by regulation

The American Hospital Association takes great pride in the progress that has been accomplished by the Blue Cross Hospital Prepayment Plans in protecting more than 21 million people in forty five states against the unexpected costs of hospital care The expansion of this prepayment system which has been sponsored by the association, has been one of the greatest examples of voluntary public cooperation in the world We believe that our government should be actively supporting this program instead of criticizing it because it has not yet covered the entire population. Blue Cross has been a dramatic development and much of its success has been dependent on payroll deduction The federal government, the largest employer in the country has not taken the simple step necessary to offer this protection to its employees through such payroll deduction Instead high officials criticize Blue Cross because no greater a proportion of the population is covered Cooperation from the federal government would be an easy step and most helpful in this voluntary movement to offer hospital benefits to the employed population and their dependents Blue Cross has merited such government cooperation—certainly not its criticism

Blue Cross is low in cost, and its costs of operation are low Only those who are now employed would contribute to the program under S 1606, and these are all eligible to enroll with Blue Cross In our opinion it would be far better that these voluntary plans with their broad coverage for the employed and their dependents be further extended before we consider compulsory insurance as the easy answer to the whole problem of distributing hospital and medical care The "magic of averages' is not the complete answer to all our problems

Incidentally I wonder if you have considered the probable attitude of the veteran to this program of health insurance on a compulsory basis? Under present circumstances you know, the veteran is already receiving extensive health services without cost to himself Yet if you enact this bill you are going to have to tax these veterans along with the rest of us, to pay for benefits they are already receiving for nothing The veterans are a substantial group who have little to gain and a great deal to lose by the passage of this compulsory health bill

As I have said, the American Hospital Association has as one of its primary aims the better distribution of hospital services to our people and the continuing development of better standards of quality and service With this in mind we have actively supported the Hospital Survey and Construction Act, which was studied by your committee last year and passed by the Senate last December That bill is now being studied by a committee of the House of Representatives, and if it is enacted we believe it will go far toward relieving the present shortage of hospital facilities in this nation We wish to compliment your committee for the fine work that was accomplished in the development and passage of S 191

However, the construction of additional hospitals and the extension of Blue Cross will still leave one area which requires the attention of the federal government. We believe that all citizens, irrespective of their ability to pay, should obtain medical and hospital care according to their needs Such a program requires acceptance by the federal government of the responsibility of helping to meet the basic costs of care to the needy We believe this is a primary responsibility of state governments to be administered on a local basis but with federal aid to equalize this assistance among the various states

With Blue Cross plans for those who can pay, federal aid to the needy and a program for construction of additional hospitals in areas where they are most needed we believe adequate and excellent health service can be made available to the whole nation without seriously disrupting the American system of voluntary health care which is admittedly, one of the finest in the world. This broad distribution of care could be achieved without the vast drain on federal resources and without taking the grave risks that are inherent in the program you are now considering Such a program permits orderly development of demand for more hospital and medical service, and these steps will in themselves stimulate an increased supply of the competent professional workers required to staff expanded facilities Hospital progress in this country has not been surpassed elsewhere. It has come about by voluntary action of the American people and without government control or interference It is continuing to grow and will improve at an ever increasing rate if it is not so controlled. Humane care of the sick has been based on local effort and has been developed on an individualistic basis It could not be standardized or regulated by government without losing much, if not all of its value

SENATOR MURRAY Mr Hayes do you recognize the fact that in this country there are a large number of people who for financial reasons, are unable to pay for modern medical care and hospitalization? MR. HAYES Certainly, every one in hospitals realizes that and we take care of them for nothing in practically all our hospitals

(*Senator Murray asked many questions about Blue Cross plans and services rendered free*)

SENATOR MURRAY You have read the circulars of the National Physicians Committee in which they say this is socialized medicine and regimentation, and so forth? MR HAYES All medicine is socialized as far as that goes I would say it is federalized medicine.

SENATOR MURRAY Is it federalized medicine or socialized medicine? It is nothing more than undertaking to give to the people of this country an opportunity to prepare for the medical care that they may need in emergencies MR HAYES They have an opportunity now, Senator in commercial plans and otherwise, that I would believe to be much less than the 3 per cent of $3 600 or whatever the percentage might be There are opportunities for every one to enter into these medical plans on an indemnity basis

SENATOR MURRAY I would like to have you furnish for the record any indemnity plan that would furnish the extent of care medical care and hospitalization that is proposed under this bill

SENATOR MURRAY Would you prefer to see a system where people would come in and have their care paid for by the government in preference to a system whereby they could be enabled under the national insurance plan, to pay for it themselves? MR. HAYES Not if the federal government controlled that system, no sir

SENATOR MURRAY What is the federal control in this system that you are so opposed to? MR HAYES It is written throughout the bill The Surgeon General would determine which hospitals could serve the public We would be obliged to take a maximum rate of $7

SENATOR MURRAY I wish you would point that out in the bill for me. I know of no such provision It provides that

the patient should have the choice of the doctor and of the hospital in which he wishes to be cared for MR HAYES We are not approved by the Surgeon General It mentions "hospitals approved He determined the standard to be applied to the hospital and to the establishment and maintenance of the list of participating hospitals That is included in page 44

SENATOR MURRAY Do you not think it would be advisable, as a provision, to have the government investigate these hospitals and determine the character of their personnel and the ability to give the kind of service that would be needed in our modern conditions? MR. HAYES On a local or state basis I believe that is all right.

SENATOR PEPPER When I conferred with the Veterans Administration about a week ago, General Hawley definitely informed the delegation and myself that it is only service connected disability that they are trying to take care of MR. HAYES They are taking care of them in our hospitals to some extent

SENATOR PEPPER If a veteran received care for non-service connected disabilities in this system contemplated by this bill and if his family received coverage and care, it would be appropriate for him to pay some kind of a compensation, would it not? MR HAYES Yes if his family derived benefit from it

SENATOR MURRAY Is there any reason why similar arrangements under an insurance plan could not be entered into with hospitals? MR. HAYES Well, Senator if you did it on the basis that the Veterans Administration is doing it, paying for the cost that is considerably more than $7 a day in the average voluntary hospital My hospital is rather economically conducted and our costs in ward patients went up over $10 per patient last year for the first time

SENATOR MURRAY I notice you have discussed the effect of this bill on the medical profession Did you prepare this entirely by yourself? MR. HAYES I prepared the statement and sent it out to members of my council and asked for their suggestions, and they scarcely changed a word

SENATOR MURRAY They scarcely changed a word, but you had their advice and suggestions in the matter? MR. HAYES I merely followed the policy of an officer of the association of letting the officers and trustees know what I was going to say

SENATOR MURRAY You did not let the Medical Association know what you were preparing this statement for? MR HAYES No, we are not permitted to speak for the medical profession We speak of the effect on medical care

SENATOR MURRAY Did you talk it over with the staff in your hospital? MR. HAYES No, sir

MR HAYES Under the Blue Cross Plan we are paid the identical amount for each patient and they all get the ultimate in medical care

SENATOR MURRAY They get the highest character of medical care? MR HAYES That is right but the Blue Cross starts off by paying $15 in New York City, $10 for the second and $9 for the third

SENATOR MURRAY So you would get much more under the voluntary system than the federal system? MR HAYES The hospitals get more than is proposed in this law

SENATOR MURRAY That is a very important item of course that you would make more profit under the voluntary system than you would under the federal system? MR HAYES Senator we never make a profit. We always suffer losses

SENATOR PEPPER Mr Hayes, I notice from your statement that there are some *3,500* hospitals that are *members* of the American Hospital Association MR HAYES Yes, sir that is right

SENATOR PEPPER These comprise about 85 per cent of the civilian general hospital bed capacity of the nation? MR HAYES That is right.

SENATOR PEPPER Generally speaking who owns those hospitals? MR. HAYES They are owned by church organizations

SENATOR PEPPER What percentage is that? MR. HAYES That is about a third

SENATOR PEPPER Who else owns them? MR. HAYES The remainder are community enterprises

SENATOR PEPPER They are owned by communities? MR HAYES We have in our membership municipal and state hospitals I am talking about the average voluntary hospital It is difficult to say who owns an organization of that sort It definitely has no ownership It has a control in the board of trustees It is built with philanthropy

SENATOR PEPPER You said about a third of the hospitals composing your organization are owned by church organizations Can you give me a general idea as to what percentage of the whole number is owned by public bodies that is, municipalities counties, states or public bodies of any sort and what percentage are owned by private bodies where public funds do not enter into them

MR BUGBEE I can give you an exact breakdown Senator Pepper I think the third is high There are about 1 000 church hospitals in the country Of our membership, I think it is 700 church hospitals and 500 of municipal, county and of that type Then there are several hundred proprietary, which are, by and large, a small percentage of the bed capacity of the country as a whole, and the rest of this nonprofit type of corporation

SENATOR PEPPER What do you mean by 'proprietary'? MR BUGBEE They are owned by physicians

SENATOR MURRAY Or are they owned by a group of physicians? MR BUGBEE Yes, they are

SENATOR PEPPER You say about 500 are publicly owned by counties and that sort of thing? MR BUGBEE That is right.

SENATOR PEPPER And the others are owned by nonprofit organizations the funds for which are derived by private contributions? MR BUGBEE They are at least nonprofit as to any payment of dividends The building may have been built by philanthropic gift or some of their funds for support of free care may be currently given each year, or the majority of the patients may, in certain instances, pay the costs themselves or indigent patients may be paid by the local community out of tax funds They are nonprofit

SENATOR PEPPER Already a considerable portion of the hospitals of the country serving civilian needs are supported by public bodies and by public funds? MR BUGBEE If you take all beds, mental, tuberculosis and others, that is certainly true by a great majority We are referring to general hospital beds

SENATOR PEPPER Mr Hayes could you give me some idea as to how much charity the hospitals of your association give every year to the patient? MR HAYES Well, I have not the percentage Of course, a good many of the hospitals are city or county institutions that are all charity Every voluntary hospital does a certain percentage of charitable work a little bit less in recent years If people had a little more money it would be different My own hospital averages over the year about 60 per cent of the patients as charity patients

SENATOR PEPPER Taking the needs of the United States what is the deficiency at the present time in the number of hospital beds required? MR BUGBEE There is variation as to the standards required The Hospital Survey and Construction Act suggested a maximum 4½ beds per thousand for general hospitals I believe the census of hospitals in the country is something over 3, with wide variation by areas on some above and some below

SENATOR PEPPER Can you say that all the people of New York City get all the hospital and medical care that they deserve and should have for their health? MR HAYES If they come for it we have certainly more than sufficient beds to take care of them in the city

SENATOR PEPPER You reported that part of your patients paid and 60 per cent get charity? MR HAYES That is right.

SENATOR PEPPER What do they have to show to be classified as a charity patient? MR HAYES The admitting clerk asks them where they live their earning capacity and the rate might be determined as nothing a dollar or $1 50 a day We are required to have experienced and diplomatic people to ask those questions but no one ever signs any oath that he is entitled to it

SENATOR PEPPER Every man's word does not have to be buttressed by an oath They have to meet a means test in order to be classified as a charity patient. That is what they are. MR HAYES That is right

SENATOR MURRAY The reason you can give that service there in New York is because already the hospitals there are on a public basis MR HAYES No, sir New York has about the poorest record of any large city in the country as to what it pays the voluntary hospitals for care. For instance in the hospitals in New York City, New York City pays a maximum of $3.25 per day for a case in the voluntary hospital and that has to be strictly an emergency case, unable to go to a city hospital before they accept that If a man comes in with pneumonia if it is not very acute, they would not even pay for that New York has a very bad record in that respect, and we have made several pleas We are still hopeful that beginning with the first of July we will get a little more assistance.

*(Senator Pepper argued with Mr Hayes at length over the Federal control of hospitals)*

SENATOR PEPPER Are you not thinking more of how it will affect you and your pleasure and your interests in the matter

than you are of those people out there in this country to whom this offers the only hope of getting the kind of medical and hospital care that they should? MR HAYES I think that is an unfair statement I have been twenty years in the hospital business and I could have earned an easier living elsewhere

SENATOR PEPPER I do not say that you have no right to think of it from your point of view but every time we think of the balance of good it will do to the one group as to the detriment of another we have to consider those things When we ask for taxes for a public purpose we are balancing interests against one another Now, that is what we have concluded some of us, in respect to this legislation There may be a certain amount of inconvenience until we can learn by experience a better method It may have faults in it and I am sure it will We are saying that when you balance up the inconvenience it may cause somebody in the hospital or maybe even the bad effects it may have with the fact that it will give life and health to millions of men women and children in this country who cannot otherwise get it, then we feel that we are entitled in that balance of interest to side with the needy rather than with somebody who from his particular experience may not think it is a good thing Do you see our point of view? MR HAYES Yes I see it very clearly except that we believe in evolution This bill is entirely too much in the nature of being revolutionary without sufficient people to carry out its purposes

SENATOR MURRAY Do you mean to say there are better opportunities today for people to get the best modern medical care the fullest and most complete modern medical care than there were twenty-five years ago? MR. HAYES There is a tremendous improvement. You can take for instance the lengthening of the span of life and everything else

SENATOR MURRAY The hospitals do not have anything to do with that Hasn't that gone through Social Security to a very large degree? MR. HAYES That was here before Social Security was ever enacted The lengthening of the span of life and certain hospitals have had a great deal to do with that and the research in hospitals has had a great deal to do with it.

SENATOR MURRAY Hasn't that research taken place in laboratories, and haven't the greatest advances taken place as a result of experts and scientists working apart from the medical profession and apart from the hospitals in developing these modern scientific ideas? MR HAYES No that always is with hospitals and sick patients

*(Senator Murray Senator Pepper and Mr Hayes discussed at length the comparative costs of government and voluntary plans)*

*(Senator Pepper and Mr Hayes discussed the control over hospitals under the Wagner-Murray Dingell bill)*

*(Senator Donnell questioned Mr Hayes as to his education and career)*

SENATOR DONNELL Was Senator Wagner one of the authors of this bill recently a patient at your hospital? MR. HAYES Yes sir

SENATOR DONNELL Has it [the house of delegates of the American Hospital Association] expressed itself as being in favor of compulsory health insurance administered by the federal or any state government? MR. HAYES Never

SENATOR DONNELL Now Mr Hayes, this morning Senator Murray our chairman who has devoted a tremendous amount of time to this subject, referred many times to what he considered to be the effort of this bill S 1606 to guarantee the best quality of modern medical care I ask you if you have found anywhere in this bill in the first place any such language as that best quality of modern medical care ? MR HAYES I do not recall it I have read it about three times, and I do not recall it

SENATOR DONNELL And may I call your attention Mr Hayes to page 68 to the fact that there is a limitation there to which reference was made this morning of the amount of the expense which hospitalization benefits may include under the bill? I read Not less than $3 and not more than $7 for each day of hospitalization not in excess of thirty days which an individual has had in a period of hospitalization and not less than $1 50 and not more than $4 50 for each day of hospitalization in excess of thirty in a period of hospitalization and not less than $1 50 and not more than $3 50 for each day of care in an institution for the care of the chronic sick.' Would you tell us please, Mr Hayes, whether or not hospitalization frequently in order to have the highest quality the best quality for I will quote the Senator again the best quality modern medical care administered whether hospitalization would require a greater expense per day than any of these limits specified in this bill MR. HAYES Definitely a greater expense

SENATOR DONNELL Considerable emphasis this morning was made on the subject of whether or not this was federalized medicine Also Senator Murray called your attention to the fact that some literature has gone out calling it socialized medicine, and you would call it federalization I take it I am correct in this, Mr Hayes According to your analysis of this bill, the provisions of title II, namely that portion of it which relates as it is entitled, to prepaid personal health insurance benefits or what you and I may term compulsory health insurance, that is to be administered not by the states but by the federal government that is correct, is it not? MR. HAYES That is my understanding

SENATOR DONNELL It is true there is a provision in here to the effect that, and I call your attention to page 37 and following in the administration of this title the Surgeon General shall in so far as practicable give priority and preference to utilizing the facilities and services of state and local departments or agencies on the basis of mutual agreements with such departments or agencies" et cetera That is in there all right? MR HAYES Yes sir

SENATOR DONNELL But the fact is that the Surgeon General is the man who gives the priority and the preference and makes the decision MR HAYES That is right

SENATOR DONNELL And the Surgeon General as I understand it and as we all understand it is exclusively a federal officer that is true, is it not? MR. HAYES That is correct

*(Through his questions Senator Donnell emphasized the nature of federal control under the Wagner-Murray Dingell bill)*

*(Senator Donnell brought out that the Surgeon General would make the contracts pay the bills and determine the pattern of hospital services under the Wagner-Murray Dingell bill)*

SENATOR DONNELL So it would appear would it not Mr Hayes, that in the first place the contracts are made by the Surgeon General with the hospital second he directs payments of moneys over to the hospital in the third place, he selects what hospitals meet his approval under the bill MR HAYES And writes the rules and regulations

*(Senator Donnell brought out that there is really no free choice of hospital under the Wagner-Murray-Dingell bill)*

### Statement of Rev John G Martin, Past President of the American Protestant Hospital Association

REV MR. MARTIN From very early history treatment of those suffering from illness has been a traditional function of the Christian Church Church hospitals today are an important segment of the hospital field I do not believe it is the purpose of the sponsors of this legislation to find fault with the quality of service that has been rendered in any of these church hospitals

However it now appears that in spite of the admittedly excellent service that is now being rendered this legislation would interject the federal government into a position between the hospital and the patient There would be a strong tendency to substitute adherence to the standards fixed by the governmental agency in place of concern for the patient's welfare If this happens the federal government then becomes the dominant force in the whole health field and will tend to squeeze out the religious influences which have contributed so much to present day developments

We are concerned about the entry of the federal government into this picture in place of private philanthropy and human service which has done so much for the health of our nation

In this discussion I would not want to make the impression on you that we do not favor government interest in the health field Government has had and still has a very important function to perform in safeguarding and improving the general health of its citizens It is our point that government should do this not by destroying a soundly developing system and substituting one of its own. Instead the government would be wiser to take advantage of the program that has so far been so successful and improve on it by supporting and developing further the best features of the present system I am sure you are aware of the great strides that have been made in recent years and are still being made today in the health field.

The system we have in America today has served us well and has made notable progress It is strong and healthy and continues to grow We believe that the answer to the health problem of our country is the further development of what we have. We greatly fear that if attempt is made to spread this present system of hospital and health care too thinly and too suddenly great loss of essential values will inevitably result. For that reason we believe the legislation before you should

have the most careful and thoughtful study before any action is taken on it

*(Senator Pepper questioned Rev Mr Martin on statistics of health and hospitalization)*

SENATOR PEPPER Are you aware of the fact that 40 per cent of our counties do not have a full time public health officer? REV MR. MARTIN Those figures should be open to interpretation There are a great many counties that do not even rate a hospital, but because of the great ease in transportation the patients in those counties could easily have access to the existing hospitals and the hospitals created by S 191

SENATOR PEPPER If you could save the lives of men and women and children in this country, aren t you willing to make a few concessions and a few legalistic compromises and help the people of the United States get a national insurance system if that will save human life? REV MR. MARTIN My belief is that real development of our present system would accomplish that better than a compulsory system

### Statement of Alphonse H Schwitalla, S J, President of Catholic Hospital Association, Accompanied by M R Kneifl, Executive Secretary, Catholic Hospital Association

REV DR SCHWITALLA These institutions are the most compactly organized group within the voluntary hospital field, being bound together, as they are, by a common purpose, a common outlook on life, a common attitude toward the patient, a common motivation that is spiritual and religious and a common desire to retain in and, if it should not be there, to introduce into the care of the sick not only the highest scientific and professional but also the very highest spiritual and religious influences

SENATOR MURRAY I am sure we are all satisfied with that, Father I think we are all absolutely in accord with that statement which you have made

*(Father Schwitalla called attention to participation by the Public Health Service in planned parenthood clinics)*

REV DR SCHWITALLA After having held out this hope for a future expansion of their opportunities to the members of an association specially interested in parenthood planning and lest there be any misunderstanding of his meaning, a representative of the U S Public Health Service went on to discuss the mode of operation of the health centers as part of the venereal disease and tuberculosis control program but also as a part of a possible planned parenthood program He said 'In states like North Carolina, Alabama and several others which have decided that child spacing programs should be part of their public health activities, these health centers would house clinics for that purpose It is the policy of the Public Health Service to cooperate with the health departments of the state in the programs they carry on for the protection and advancement of the health of their people Any state deciding to develop a planned parenthood program could expect from the Public Health Service the same consideration that would be given to any other proposal in connection with its state health work"

The speaker was, of course, not alluding directly to S 1606, because at that time the bill was not in its present form but he was summarizing the "Postwar Planning of the Public Health Service" which has for its purpose "to make available to every family the health services it needs and should have" Besides, the definition of public health work as contained in the present bill is in complete harmony with the understanding of the public health official whom we have here quoted.

I know I am here raising extremely difficult issues I know too that the Public Health Service has committed itself as a policy to cooperate with the various public health programs in the various states, so that, if in a state planned parenthood is defined by statute or regulation to be part of the state's public health program, the policy to which I have just referred in the quotation is carried out that is, "It is the policy of the Public Health Service to cooperate with the health departments of the state in the programs they carry on for the protection and advancement of the health of their people. Any state deciding to develop a planned parenthood program could expect from the Public Health Service the same consideration that would be given to any other proposal in connection with its state health work '

On behalf of those citizens of our country who regard planned parenthood as practiced through contraceptive procedures or preparations as basically subversive of the moral law, as destructive of the welfare of the nation and of individual morality, I recommend and request changes in the content and the language of the bill, so that grants from the federal government to the states for public health services may not be used for the furtherance of programs which, no matter how contraverted the issues might be, are still condemned by the Criminal Code of the United States and are offensive to the convictions and beliefs of large percentages of the population of these United States

SENATOR PEPPER Excuse me, Father Do you not think, having quoted the statement, you should give the author of the statement for the record? REV DR SCHWITALLA I would be glad to give it to the secretary and to you, unless the chairman rules otherwise.

SENATOR MURRAY That is satisfactory

REV DR SCHWITALLA If that is satisfactory, I do not see any special purpose in publishing the name of the author

SENATOR PEPPER If you are going to quote the statement and say that the person is within the Public Health Service, I think you should

SENATOR MURRAY I think if he gives it to us it is all right.

SENATOR PEPPER Is there any reason for that? REV DR. SCHWITALLA I have a little feeling about that, Mr Chairman, unless you want it done

SENATOR MURRAY We will not insist on it.

REV DR. SCHWITALLA I will give it to you right now and if you will give it to the secretary, he can take the name right now It is rather a high official in the Public Health Service

SENATOR PEPPER As far as I am individually concerned, I might not have an objection to the statement, but some one might have objection to the statement. It is attributed to the Public Health Service and to an official, so that if it is an objectionable statement it is the basis of a complaint against the department and yet who the person is or the position he had or the authority he had is not revealed in the authorship of the statement I thought if you were going to use it at all, it would be fairer to the Public Health Service to disclose who the person was

REV DR SCHWITALLA It was not a secret quotation at all, because it was made in a public address at the Waldorf Astoria Jan 24, 1945

SENATOR MURRAY I submit myself Father, you are willing that the committee should have access to it That will be satisfactory

REV DR. SCHWITALLA Yes I think a lot of people probably know this gentleman

SENATOR MURRAY Yes

REV DR SCHWITALLA I regard him as a friend of mine. He knows I am going to quote him The amenities have been taken care of I do not believe it is wise to spread this name abroad among other people Some of the Sisters are in here and some of the Sisters know this man There is no necessity of putting him into a certain category I have a feeling that the Sisters might have a certain resentment about the statement. Why increase that?

SENATOR PEPPER I cannot lend my acquiescence to the quotation of a public officer, and then a declination to give the official s name in a public discussion of the matter I do not want to be in any sense of the word objectionable, but I just do not think it is of propriety to quote in the record in a prepared statement a public official of the United States Public Health Service and not disclose who the official is

SENATOR MURRAY Well, the committee will have access to it, and it seems to me that that will be sufficient If, after further study I should change my mind—

SENATOR PEPPER As far as an individual member of the committee is concerned, I will not agree to be bound. If I determine that I desire to disclose the name of the person, Mr Chairman, I shall feel free to do so as a member of the Senate and a member of this committee. I do not think this is a secret session and unless there is some special reason, I do not see why we should do that.

SENATOR DONNELL Mr Chairman, I find myself in accord with the Senator from Florida I do not mean to embarrass Rev Dr Schwitalla, but I do believe it is a matter of public concern, and I should feel exactly as the Senator from Florida has expressed himself

SENATOR MURRAY Well Father, if you wish to comply with the request of the Senators you may do so

REV DR SCHWITALLA Well, I certainly have no wish to stand on any constitutional rights here. I think I have them, but if the committee wants them, it was an address by R C Williams, M D Assistant Surgeon General, Bureau of Medical Services, Public Health Service. The address was made before the twenty-fourth annual dinner meeting of the Planned Parenthood Federation of America The title of the pamphlet is "Responsibility for the Health of Tomorrow s Family The

place was the Waldorf Astoria, New York, Jan 24 1945 I made it my business to find out whether the policy of which Dr Williams here speaks, namely that it is the policy of the Public Health Service to cooperate with state plans without discriminating with reference to individual phases of a public health program, was or is the policy of the Public Health Service. I understand, from several inquiries, that it is and that when funds are given by the Public Health Service to the states for the extension of public health services it is the state's program that is accepted. Now, that evidently is at the bottom of this whole situation, and I think it is not without some bearing on the whole situation here that we are discussing in this committee.

The Catholic Hospital Association regards it as one of the desirable features of this bill that it actually makes provision for the medical care of needy persons Such a provision is of course, indispensable in any comprehensive national health program The question may however, still be raised legitimately whether the indigent should be taken care of in his illness through the special provisions of a public assistance program or whether we should not rather make efforts to take care of the needy through the same program through which the contributor to the program, in this case the wage earner is taken care of As a matter of fact, at the present time, if the situation is carefully analyzed the hospitals and the physicians who are most keenly alive to their obligations draw no line of distinction between the paying patient and the nonpaying patient. Even if the sarcastic cynic or the scoffer sees that such idealism is all too rare to constitute a real factor in the health care of the nation, it still remains true that the physician and the hospital and the nurse must treat a human being as a human being according to the basic requirements of any reasonable system of ethics irrespective of the paying capacity of the patient Such has been the standard which the Catholic Hospital Association in conjunction with the other Hospital Associations has always held up as a basic principle for ensuring proper medical care of the indigent

It is true that our public hospitals have been the bearers of the obligations of society to give hospitalization and medical care when it is needed to the completely or partially indigent, but in doing this I wish to visualize their functioning not as agents of government but as agents of society, assuming the obligations of society for its most needy members and thereby sharing with the voluntary hospitals which are also agents of society this prime and indispensable duty—a duty which arises from the fact that society has been inadequate to supply the needs to all its component members for food housing clothing, employment, recreation this neglect, no matter how inevitable it might be resulting in the sickness or disability of the indigent or the medically indigent.

It is worthy of note that S 1606 sedulously avoids all direct reference to compulsion The extent of the personal health service benefits are specially defined and these consist of general and special medical benefits and so on all purchasable through funds authorized to be allotted to the Personal Health Services Account,' to which there is to be credited by the Secretary of the Treasury amounts equivalent to 3 per cent of the wages paid after a stipulated date with respect to employment but for wages only up to and below $3,600 per annum

While, therefore, the compulsory element is understressed it is clear that, through the tax on wages the legislation becomes definitely compulsory and it becomes compulsory moreover with specific reference to health insurance as the procedure through which the contributing wage earner is to purchase his health protection

Now the interesting point about all of this to me is that there is really a compulsory or an obligatory feature in health care It is man's duty to take care of his health and of the health of those who are dependent on him, and that duty is binding on him by virtue of the natural law which obligates every reasonable and rational human being and which exercises compulsion over man within the full limits of his financial and physical capacity to obey it This obligation is the same kind of obligation as man's loyalty to his country, man's obligation to worship God man's obligation to respect the rights of his neighbors The compulsion arises from the full effectiveness and force of the natural law and from its universality Hence man is a trustee of his life and health and not the owner of them, a trustee for the health of the members of his family and not the owner of that health If man wilfully and maliciously or through culpable negligence disregards his own health or that of his family he is subject to severe censures before the tribunal of God no matter what individual persons might think of him. The compulsion in this obligation, like so many of the obligations of the natural law, though binding on the individual, still leaves the individual free, leaves him free in the full enjoyment of a vast freedom because the obligation is not specific with reference to this or that method of living up to his obligation

Man is not obligated to choose one method rather than another of safeguarding his health. Man is not even bound to use the best possible means or allegedly the best possible means of safeguarding his health He may, as a matter of fact choose to safeguard it at the cost of seemingly disproportionately large inconveniences or sacrifices Moreover, the obligation of man safeguarding his health may have to yield to higher obligations, as for example when a man deliberately chooses to expose his life to danger in the defense of health or life of a dear one or of his country This means also that health and, for that mater, even life is not an absolute good but only a conditional and a contingent good All of this means that the observance of man's obligation to safeguard his health, though the obligation is a compelling one is still subject to the prudence the good judgment, the free choice of the individual who conforms to the basic law There is compulsion, therefore, with reference to the safeguarding of man s health, there is no compulsion arising from the natural law to choose this rather than another form of providing for his health

Is it apparent that the system of private initiative in medicine has so completely failed as to justify this extreme compulsion? Moreover is it apparent that a compulsory system is going to be effective in remedying the alleged or even the acual shortcomings of a system of private initiative? Is it apparent that all the individuals whose payrolls are going to be put under contribution are so dissatisfied with the present methods of taking care of one s health that they will willingly undergo the serious inconveniences which are implied in a compulsory system such as is here projected? Is it apparent that society is so seriously endangered by the system of private initiative as to make this compulsory system immediately imperative? These are the questions which I believe must be answered before we can justifiably pass a law such as we are here discussing

The compulsion of which we are here speaking implies the giving up of considerable freedom and the relinquishment of considerable responsibility We cannot create an intelligent and enlightened and a responsible citizenry unless we entrust duties and obligations to that citizenry To remove responsibilities from man is not to elevate him but to degrade him To take away from him the obligations of maintaining himself and his family in a state of refinement and fuller living is not to foster that man s character but to weaken it unless the removal of responsibility from him is accomplished with a clearer understanding of the reasons why that relief is given to him To make a strong nation requires that man must be given responsibility rather than to have responsibility taken away from him

If society could not create and could not maintain the processes by which the human being can meet this obligation of his health care, then the government would have to give aid to society and ultimately to the individual so that society might meet this obligation But even in that case the government would not be permitted in any reasonable interpretation of ethical principles to ride rough shod over the obligations of citizens but would have to respect the rights of human beings as far as this is possible under the concrete circumstances of each given situation

Two questions present themselves in the face of all this 1 Can society create and maintain the processes by which in our present question the health of the nation can be safeguarded? 2 What particular characteristics and capacities of the individual must be protected if government feels itself obligated to interfere in the individual's responsibility for his own health care and the care of his dependents?

With reference to the first question can society really create or maintain the processes necessary for safeguarding the health of the nation? If our question pertains to American society, my answer is unhesitatingly and unqualifiedly an emphatic yes It has done so and one by one disease entities have received mortal blows from the votaries of American medicine, from the research workers who understand the biologic processes that have yielded such amazing triumphs It is now said that through the aid of government our schools of medicine can be still better protected just as our research can be more emphatically fostered and the pertinent sections of S 1606 are significant and at the same time most valuable contributions to afford the proof that society and government in their wisdom have realized that through federal aid in these two important

areas much more can be accomplished than has already been achieved It would seem, therefore, that with miracles such as we are here discussing already accomplished no one would dare say that limits have been set to the effectiveness of private initiative Through the glorious pioneering of our American investigators, and through the discoveries and the daring aggressiveness of those who widen the horizons of man's thinking it should certainly be possible to bring the whole American people under a voluntary health program, since problems of so much greater difficulty have already been successfully solved The proof, therefore, cannot be brought and to my thinking, will not be developed to show that society is incompetent to cope with this problem through the processes that have already been employed in the solution of much greater problems If we can achieve our purpose through the encouragement of voluntary initiative we shall strengthen the sense of responsibility of the individual we shall safeguard the dignity of the individual as that of a person who is intellectually and emotionally competent to make his own choice concerning the manner in which he obeys the natural law to which he is subject From all of this it becomes apparent also what features must be preserved in the reemphasis on the importance of each one's obligation to fulfil this basic responsibility

Once it is admitted that a compulsory national health program is to be initiated then it can easily be seen that such devices as are contrived in S 1606 for the administration of a national health program become all but necessary If there is to be, as S 1606 contemplates, a compulsory national health program, I for one would have to insist that responsibility for it should be centralized, that there should be drafted rules and regulations which would ensure a measure of uniformity in the whole program that these rules and regulations should be such as to be more or less universally applicable and that the rules and regulations be written so as to simplify administrative procedure I can easily understand that routinization mechanization standardization of the procedures should be effected so that the costs of the program may thus be minimized and so that furthermore, the most easy approach be made to the generality of the people whom the program is devised to protect Hence I can see why so much power should be entrusted into the hands of the Surgeon General and why there should be the special kind of an advisory council which the bill creates and why there should be certain kinds of appeal bodies and why the Surgeon General should himself be the arbiter legally constituted of controversies which his own actions may have evoked and why all the other numerous provisions of the bill should follow as necessary corollaries from the necessary concentration of administrative power

But think of what all of this is doing first of all, to the ensured person secondly to the professions of medicine, dentistry and nursing, thirdly to our hospitals, and, fourthly, to society at large It has been said and we must pay our respects to the writers of the bill for at least thinking of this concept that the methods of administration should be drafted so as to ensure the prompt and efficient care of individuals, promote the personal relationship between physician and patient provide professional and financial incentives for the professional advancement of practitioners, and encourage high standards in the quality of services But frankly, I cannot help but wonder whether the relationship between physician and patient can possibly be promoted through such a system as S 1606 proposes It would seem to me that at ever so many steps in the contact between patient and physician there would be injected into the patient-physician relationship extraneous considerations of the most diverse kinds The physician would be expected to make reports to his government to maintain records quite different from the case histories which he now maintains and which would be prescribed for him he would lose a great deal of contact with his patients through the fact that he receives a stipulated sum from government sources Since he is being paid on a service basis and on the basis of a fee schedule he would be bound to lose the proper attitude toward professional remuneration, which in any true concept of medical care is regarded only as a token payment and not in any sense as a wage or salary or stipend but only as an honorarium All of these consequences would be found to follow as I see it, and from all of them there would also necessarily be found to result a deterioration in the character of medical practice. There would almost of necessity be a commercialization and the material outlook on practice which would thus be fostered might actually result in serious consequences to the whole concept of medical care for the American people

As for the professions, I wish again to express my appreciation of the fact that the hope was formulated in the bill that there would be no enslavement of the medical profession or of the other health caring professions through S 1606 I wish I might be able to share this optimism, but, as I see it centralized control would be inevitable and that means control through regulation, and control through regulation means a curtailment of freedom of action, and such a curtailment in turn means a loss of interest in one's professional activities And so a chain of successive causes and effects would be initiated the end of which, taking human nature as it is, would lead to nothing else but what has been eloquently envisaged by others who have testified before this honorable committee

There is a surprising, astonishing and unique feature in S 1606 the full import of which I have thus far failed to fathom In the old age and survivors program as well as in the unemployment program I find that the benefits all take the form of a direct cash payment to the beneficiary In this way the dignity of the beneficiary is safeguarded The government indicates to him or to her that the beneficiary is trusted to use his ingenuity or his initiative or his honesty to provide for himself through the medium of purchase with these cash benefits such commodities as the beneficiary chooses to purchase For some reason or another that I cannot understand, the situation is quite different in this health insurance The benefits take the form of services to the beneficiary The strange thing is that the services are not furnished by government officials, at least according to S 1606, but by those doctors, dentists nurses, hospital administrators, laboratory technicians who have signified their intention of obeying certain regulations laid down by the Surgeon General in pursuance of which they will furnish their respective services to, not the government, but the patient

In the old age and survivors program and in the unemployment program there is a relatively simple contract, a contract between the employee who in cooperation with his employer pays a certain amount of money into the federal treasury, and the federal treasury in turn, on the occasion of a predefined contingency, makes a corresponding payment to the individual citizen In the health care program, however, there is a tripartite and probably a multipartite contract The least complicated situation is a contract between the governmental agency, the physician or hospital or nurse or dentist and the patient To make matters worse, this tripartite agreement is superimposed on a basic and fundamental mutual contract the contract existing between the patient and the nurse. There are complexities developing from this pyramiding of responsibilities which are most difficult to understand. Let us take the patient-physician relationship, as an example, particularly apt since in the bill itself one of the purposes is defined to be the fostering of the patient-physician relationship In its simplest form that relationship demands a man to man contract, with the patient having a certain priority of rights because he is in need and the doctor having a priority of privilege and obligation because of his professional standing and his ability to give the patient what the patient needs

Over and above this relationship the patient who is a wage earner and is employed has entered into another contract with his government by virtue of which the government will supply funds to an as yet indetermined individual under certain contingencies That is contract number two Now the patient chooses a physician, let us assume within the panel That contract is something quite different from the ordinary contract of the patient-physician relationship and hence it is contract number three The reason why this contract is different from the ordinary contract implied in the patient-physician relationship is that an extrinsic agency, now the government, makes itself responsible for what is definitely called 'pay' in the bill and because another extrinsic agency, the Public Health Service under the Surgeon General makes itself responsible for regulating in a number of very specific ways the relationship between the patient and the physician There may ensue a contract number four, if a patient is sent to a hospital and the hospital is chosen under the provisions of the bill with contract number five if the patient requires a nurse, and contract number six if the patient requires the need of a consultant or specialist and probably contract number seven because the bill makes special provision for laboratory benefits And all of these different contracts are modified and influenced by the other provisions of the Social Security Act, particularly eventual compensation for the wage losses due to illness

Why all of this is necessary is very hard to see and I still feel that if there is to be any compulsion with reference to the elimination of a choice as to the method by which I secure

my health protection I should prefer a straightforward cash indemnity basis I do not see why the freedom of the professions must be endangered in order to safeguard the health of the nation, nor do I see why we have to endanger one of the most splendid relationships in our democracy, the relationship between the private agency and a governmental agency nor do I see why we have to inaugurate this complicated system of appeals in order to get justice for the patient or the doctor or the nurse or the hospital nor do I see why we have to create the complicated snarls in our responsibilities which arise from an unnecessary multiplication of contracts

There are other benefits that will come from a cash indemnity, the elimination of complicated administrative machinery, the conservation of the freedom of choice of the individual, the justifiable and reasonable compliment paid to the citizen when we treat him like a matured adult capable of self determination and capable of managing his own affairs rather than treating him as a helpless ward of the government

I might add, gentlemen, that giving up freedom might be too great a price

Finally the question must be raised Is it really the function of government to make itself the guardian of its citizens to the extent that would be implied in such a vast health program? There is so much to be done by government so much stimulation to be given to all kinds of projects and interests, that one wonders whether government should invade the intimacies of one's home and family life to the extent that would be necessary I know there have been countries in which all of this is said to have worked successfully but the transplantation into this freedom loving country of ours of foreign and exotic patterns of social behavior has been tried recently enough, and surely not one of us has had his love for this democracy of ours weakened or diminished by the experiment We respectfully recognize the successes of other countries and sympathetically try to understand their social procedures but that sympathy will not blind us to our own needs and wishes or to our own character as a nation any more than the contemplation of the alleged successes of other lands would stimulate our greed or our envy

In place of subjecting S 1606 to further analysis, I should like to make bold to suggest that we can all probably agree on a set of criteria by which we would measure a national health program and convince ourselves and others of its feasibility or its desirability or even its complete effectiveness

1 I would say, first of all, that a national health program must take into account the moral and the social obligation of each individual to provide for his own health as far as his financial resources the circumstances of his life, his physical strength might permit him to do

2 I would insist that the method by which he carried out this obligation should be a matter that is to be left to his own prudence and initiative and, let me add responsibility

3 I should wish to insist that it is the duty of government to facilitate my observance of my obligations when and if the fulfilment of my obligation becomes too onerous This means at least two things first, that the government will really grant me a subsidy of some sort when I am really in need and secondly that in periods when I am not in need I shall recognize and carry out my own obligation to provide in advance for a moment of emergency Only when I cannot carry out that obligation will the government really grant a subsidy

4 Facilitation however, in the observance of an obligation should not and must not mean an exemption from a responsibility it must not facilitate the individual's shirking of his responsibility but rather must it assist the individual to the fuller realization of his own obligations

5 I should like to insist that the obligation to safeguard one's own health and that of one's dependents is not an absolute but a conditional and a contingent one. A national health program must take this into consideration and demand not too great a price for health security

6 I should like to insist that, since the personal relationship between patient and physician is basic and fundamental in the ethics of medical practice, the administration of a national health program must be simple, uncomplicated direct so that as few as possible extrinsic influences might be injected between the patient and the physician.

7 It would seem to me that a national health program should not be a substitute for the procedures and the methods which have resulted in the present high standard of health care of the American people but should be a supplement to the existing procedures and methods This implies the preservation of many tangibles and intangibles in our culture and civilization the concepts of professional life the freedom of professional action for the physician and the dentist and the nurse, the maintenance of intimate relationships confidential in character in the patient-physician relationship the freedom of the patient's choice of a doctor and of the doctor's choice of patients, the concepts of professional competence as implying ever so much more than merely formal schooling and success in skills, the place of the hospital in the community and its relationship to the individual patient whom it receives These and ever so many other similar features of our present exalted heritage in health care deserve the utmost caution in their evaluation and in their possible modifications for fear that, by precipitate and imprudent changes, we may not so much change but rather destroy them

8 The highly desirable social purpose of universal coverage must be secured by a program which will embrace the individual who can fulfil his obligation through his payment for his health security as well as the individual who by reason of his circumstances cannot pay and for whom society has made itself responsible

9 Finally, it is assumed in all of this that government will aid in the creation of health facilities and that the development of health caring personnel will under the demands of the moment, be looked on as the joint responsibility of the voluntary and the governmental agencies in a program of mutual respect and cooperation

I have no objection to a national health program But, if you come along and ask me about a national health insurance program, that is dangerous The moment you get into that insurance question you are intermingling issues—unless it is insurance on a cash indemnity basis—and the moment you get into the benefits as to services to a hospital, patient and the doctor I cannot go with you

SENATOR DONNELL In regard to this book from which I read, and I am not undertaking to vouch for it or detract from it, this is a book, however, that was issued by the International Labor Office and distributed in the United States by the International Labor Office, whether or not the conclusions I drew from it are correct, I don't know I was greatly impressed by your comment at page 19 of your statement about the danger from a financial standpoint I refer to the results in the voluntary hospital from this effort to hold down these expenses and require them to consider $7 full reimbursement for the cost of essential hospital service I think you have given us food for thought which I confess never occurred to me I can see $7 not being enough, but I did not have enough of a far seeing eye to see the matter you point out as to the danger to the hospital service

REV DR SCHWITALLA When Blue Cross began we had 10 per cent of our patients from Blue Cross, and the rest of them let us say 80 per cent, were paying patients and 10 per cent were entirely free patients It did not make much difference whether we took them from Blue Cross at a little less than hospital costs, but now, when Blue Cross is getting to be a larger and larger factor and when you are running up to 60 and 70 and 80 or even 90 per cent on Blue Cross patients unless Blue Cross gives you the cost of the hospital, who is going to give you the rest of it?

SENATOR PEPPER About how much a day do you think would be a proper figure if we were to adopt this bill?

REV DR SCHWITALLA We have figures on different localities Our costs in some areas in different hospitals run quite definitely as low as $6 per day There are areas in the United States like that, if you can make the areas small enough There are also other areas and other hospitals where the cost runs to about $20 a day Take the unearned value of real estate If you have a hospital located in one of the most costly places in New York, it is uneconomical to tear it down and put it some other place That is one of the problems that varies In our hospital we need an encephalograph but I have not had enough money to buy one It costs $1,400, but there are other things that I need more

SENATOR DONNELL May I put into the record one item from the International Labor Office studies and reports, issued in Montreal in 1942? 'Compulsory social insurance began nearly sixty years ago in Germany and the legislation of 1883-1889 associated with Bismarck has more than any other, influenced the development of social insurance."

REV DR. SCHWITALLA I think that is true

SENATOR MURRAY I wish to offer in the record at this point a statement by Kenneth C. Crain vice president and eastern editor of *Hospital Management* a magazine of general circulation among hospitals, on Senate Bill 1606 I am sorry I cannot vouch for the citizenship of this gentlemen in Missouri, but I believe it is not necessary

MAY 7, 1946

HONORABLE JAMES E. MURRAY Presiding

PRESENT Senators Murray, Aiken and Donnell

### Statement of Right Reverend Monsignor John O'Grady, Secretary, National Conference of Catholic Charities

MONSIGNOR O'GRADY Before entering into a discussion of the question of universal coverage against the hazard of ill health it would be well for us to keep in mind a few fundamental principles of social philosophy In our society—in fact, in any society that is based on a clear understanding of the infinite worth of human personality—it must be assumed that our first objective must be to encourage the individual to provide health protection for his family through his own effort. It follows that we must also encourage the individual to enter into associations and organizations of his own choosing for the purpose of providing health protection for himself and his family Government should encourage and promote such voluntary efforts on the part of the individual It should not seek to supplant the efforts of these organizations, for in doing so it would be striking at the very foundations of a democratic society Government, therefore, has to proceed very carefully in the implementing of voluntary effort in the field of health protection

The federal government through the Social Security Act is now providing grants-in-aid to the states to enable them to provide assistance for the needy aged and for dependent children in their own homes and the homes of relatives If the federal government is willing to aid the states in providing food, clothing and shelter for the aged and for dependent children, it should also be willing to aid them in providing medical and hospital care for these two groups

In building a program of health security we should be sure from the very beginning that payroll taxes are sufficient to support an adequate system An inadequate health security program will be of little benefit to the American people Many of the problems that we are now facing in the consideration of this program center around the assumption of inadequate funds Why do we have to have so much centralized control over administration? Why do we have so many rules in regard to hospitals and in regard to medical fees? Is it not due to a desire to spread an inadequate fund thinly over a very large number of people? I believe, therefore, that it is most important that we should begin our national security program with adequate benefits based on an adequate payroll tax And I think the people studying the technical end of it should be required to explore the thing fully Our experience is limited

In the field of health security the federal government is entering into a new field and yet those who are thinking of it in terms of administration are people who have been patterned by a public health background and at times I have been critical of the public health service and I am still critical of it in lots of respects It does, at times, tend to become very bureaucratic even in its own hospitals They think in terms of a program administered entirely by government They think of a government official rendering decisions without much respect for democratic processes, and here again you have to think more and more about democratic discussion with the various groups concerned Of course it will be quite clear that, if a government official tries to impose his views without respect to democratic processes, the people and their representatives will not accept them so one gets political pulling and hauling as a substitute for democratic processes on a factual basis with the groups that are immediately concerned

SENATOR DONNELL Monsignor, I understand that not merely do you regard these voluntary methods and programs of insurance as of historical value, as the chairman put the question to you in substance a few minutes ago but you responded you hope that they will be of continuing value in the future, is that right? MONSIGNOR O'GRADY That is right.

SENATOR DONNELL And you do not favor the dissolution of these voluntary programs That is correct? MONSIGNOR O'GRADY That is right

SENATOR DONNELL And then your judgment is that they can be organized in as a part of the governmental program? MONSIGNOR O'GRADY That is right

SENATOR DONNELL Now Monsignor, one question was asked by the chairman of you a little while ago as to whether the government has not in every way encouraged these voluntary organizations I am not saying that the government may not have done so in some instances I do not know about that. But there is one instance, is there not, Monsignor, in which the government might very well have had additional encouragement, namely, by providing for payroll deductions for the voluntary agencies from the compensation paid the governmental employees? That would be quite a considerable encouragement to them, would it not? MONSIGNOR O'GRADY That is right. I think that is one important step They ought to be encouraged to keep the chance of surviving They will have to provide for some sort of reimbursement

SENATOR DONNELL Monsignor, may I ask you this question I understood you to say something to the effect a few minutes ago that you would not favor the idea of compelling a man to pay twice That is, if he is in a voluntary system and adequately insured, I understand you would not favor requiring him to pay again for insurance he would not need? MONSIGNOR O'GRADY That is right There should be some plan for reimbursing that man or encouraging him to continue his association with his present group I think that this is the whole question of rates, that this should not be written into a bill I think we ought to work that out We shall have to work it out an adequate system of compensating hospitals Otherwise, if we are going to have a sort of system that simply pays the hospital for all their patients, let us say, $4 a day you are going to put the hospitals out of business There is no question about that SENATOR DONNELL Yes

MONSIGNOR O'GRADY Now, as it stands at the present time, a lot of the hospitals go along with that, because most of their care is not in that field They find they go along with an inadequate system of compensation under workmen's compensation in the states It simply means that the hospitals are subsidizing private industry, because, after all, that affects the industrial accident rates in the states

SENATOR DONNELL Monsignor, have you worked out in your own mind the machinery of working into this governmental plan these voluntary organizations? Have you gone into that? MONSIGNOR O'GRADY I have in some detail I have been discussing it a good deal with a number of the people concerned SENATOR DONNELL Yes

MONSIGNOR O'GRADY Now, I think that there are some details When I showed this testimony of mine two weeks ago to a well known expert in the field, one of the best known he said "I think you have something there." And he said "I think you need to spell out the details of your organization a little bit more. You need to spell out the details of the local organization a little bit more" You notice I believe in a national local system instead of a national state system I think if you get into dealing with states it becomes sufficiently complex, and I think on the whole the general principles of my underlying point of view are that I think that is rather clear

SENATOR DONNELL On this matter of advisory committees, I noted your comment, which I think is well taken that there is a tendency on the part of appointive power to appoint advisory committees to appoint persons he thinks will agree with his views He is not apt to appoint antagonists MONSIGNOR O'GRADY And he presides in the meetings

### Statement of the Honorable Arthur Lewis Miller, A Representative in Congress from the State of Nebraska

DR MILLER I am a physician For the past six years I have been in Congress I have been state health director I was president of the State Medical Association in Nebraska and a fellow of the American College of Surgeons and I think I know more about being a physician than I do about Congress

I have read the bill carefully and wish to address my remarks to title II of the bill, which is the prepaid personal health service benefits It is my humble opinion that, if this section of the bill was adopted, the family physician of every citizen would be a memory of the past There would be a new character on the scene—Uncle Sam, M D I believe that this section of the bill would not only regiment the citizen and all health activities but would provide a political and socialized medical care program It would provide for a form of regimentation of medical service administered from the national level It would be expensive, wasteful and time consuming It would be ill suited to the care of the sick in general and medical emergencies in particular Such a program could not be administered in a democratic manner, pleasing either to the patient or to the physician

The quality of medical service to the patient would be strained and inferior in the beginning and would rapidly deteriorate. Medical research would be curtailed Medical education would be static, and medical progress in general would be set back many years I say this, Mr Chairman, because that has been the experience in those countries where regimentation of medical services has been tried

Speaking of experiences with socialized medicine, I have had the privilege of making three trips to Europe

*(Dr Miller stressed inferior medical service under European plans)*

I am certain, Mr Chairman, that this national health bill does not spring from our traditions or from the public spirit. It is an offspring of foreign ideology, first brought to perfection by the German statesman Bismarck In every country where Fascism Nazism and Socialism prevail there is socialized medicine

I would remind the committee that the United States gained its leadership in medical education and care by methods that have been tested in the crucibles of time and economic hardship This national health bill would abolish the voluntary control and inspiration that have brought medical education, hospital management drug purity research and medical service to their present high level The best medicine in the world is practiced in the United States We have the finest hospitals medical equipment and technics in all the world This bill would completely revolutionize medical practice, medical schools, hospitals and technical research Should we not consider carefully the progress made in the United States under our free medical enterprise before we adopt a system controlled by salaried political bureaucrats? Certainly this bill would put the life of every citizen in the hands of a medical czar not necessarily run by doctors, but controlled by politicians who hang around the court houses of the country

I have read the statement of the sponsors and authors of the national health bill

1 They state There is complete freedom of choice of doctor by patient.

This is incorrect. If either the patient or the doctor named on the panel by the Surgeon General declines to accept the other, the patient is assigned to some other doctor

2 They state There is complete freedom of choice of hospital by patient

This statement is incorrect There is no provision for freedom of choice of hospital The entire system is under regulation by the Surgeon General

3 They state There is freedom of medical practice for the doctor

This is misleading The plan is so extensive that in time there will be no private practice

4 They state There is freedom of types of remuneration for the doctor

This is misleading The doctor is forced on a salary or on a fee basis or on a combination of the two, as determined by the Surgeon General who approves the fee tables

5 They state There is freedom of types of remuneration for the hospital

This is incorrect. Hospital rates are determined by the Surgeon General with the approval of the Social Security Board

6 They state No doctor is forced into the insurance system

This is misleading He must go into the insurance system or be forced economically to cease the practice of medicine.

7 They state No doctor is forced on a salary basis

This is misleading The doctor is forced on a salary or on a fee basis or on a combination of the two, as determined by the Surgeon General

8 They state Arrangements for obtaining medical laboratory or hospital care would be essentially as they are now in this country except as to payment out of insurance fund

This is entirely incorrect The whole medical system is supervised, regulated and controlled by government

9 They state Voluntary hospitals are eligible to participate in the plan

This is misleading They may participate if selected by the Surgeon General

As the state health director in Nebraska for two years, I know that we have advisory committees We were called in occasionally to Washington but merely to O K some plans that had already been drawn up We had no force in objecting I would object to a number of things, but the plan was drawn up and here it is You must take it.

In the state health directory in Nebraska we had a maternal child health department in the Labor Department and the United States Public Health Service We had to keep two sets of books They were competing with each other as to how much money they would offer the state, overlapping and duplicating efforts of each other We had immunization vaccination and so forth The United States Public Health Service has been doing it for years The Childrens' Bureau comes in and offers you a little more money "Accept this and we will give you a little bit more"

We had two sets of nurses and inspectors, who would come around and inspect the work that you were doing under the Children's Bureau and the United States Public Health Service Both of these agencies had their advisory councils, which were merely figureheads to O K that which was already set up in Washington

SENATOR DONNELL I wanted to read a couple of paragraphs here from a statement by J G Crownhart, who was secretary of the State Medical Society of Wisconsin, located at Madison This was published in 1938 and I want to ask you whether or not this concurs at all with your view as you personally saw conditions in Europe.

He says "Again and again the observer is impressed that the standards of medical and hospital service in Europe are not generally those of America The director of one of the large public health institutes in Denmark pointed out this fact and referred to a lessening in the quality of teaching service in their medical school as one of the by-products

' 'Sickness insurance is a leveling disease,' said this professor who had visited this country on occasions It assures the mediocre physician just about the same reward as he would gain for outstanding service if he were to have time The incomes tend to be leveled but that is not all—the tendency over the years is to level the service to something that is neither bad nor good But the incentive is gone and we develop fewer brilliant minds in our teaching centers and America catches the lead in health and methods to regain' "

Generally speaking does that accord with your observations, Doctor? DR MILLER Senator, I was shocked when I saw some of the treatment being given to the patients in Europe, treatment that would not be followed in this country even in our poorest hospitals The term "disability' and 'neurotic" came out of Germany when they adopted compulsory health insurance. Patients were paid when they were unable to work, supposedly, and many of those folks developed a disabling illness Neurosis of various types developed. This was in order to get the physicians to issue a certificate that they were unable to work. Europe lost its position of importance in postgraduate work at about 1920 Before that time many American physicians went to Europe I went because I thought it would give me a little prestige in saying that I had attended a clinic in Budapest, Heidelberg and Hamburg, which I did, but I found in 1927 and again in 1935 that we could get far better training in America than we could in European countries

SENATOR DONNELL You referred also in your statement to the number of bureaucratic administrative officers and so forth who were necessarily to be involved in a plan of this kind I am going to read you just one more paragraph, if I may, from this same article by Mr Crownhart appearing on page 15 He says 'It is also to be noted that in the experience of Europe there will be an employee in the system outside of the delivery of actual medical service for at least every 100 persons insured' While the nature of the work of such employees is held for later discussion, our concept of this legislation in its basic proportions is that it must include the government as *both* the agent for the collection and the disbursement of the premiums and, furthermore, as a vast employer for its necessary administration

I assume, Doctor, that your observations and views are that there would be a great number of employees necessary in the administration of the system which undertakes to require a compulsory payment on the one hand by from 107 to 112 million persons and on the other hand the rendition of service to the equivalent number and perhaps even more Do I correctly state your views? DR MILLER There must be necessarily many many federal employees to handle such a system

SENATOR DONNELL I observe remarks along those lines in a book entitled "Compulsory Health Insurance in the United States" issued in 1943, the author of which is Herbert D Simpson, emeritus professor of public finance at Northwestern University The following statement appears therein "One such consideration is the fact that if we assign this problem to the sphere of governmental responsibility it will mean probably the greatest expansion of the federal bureaucracy that we have ever witnessed in *peacetimes* The number of employees required to administer such a system would be difficult to estimate. There are between forty-five and fifty-five million gainfully employed persons in the United States at the present time. This, with members of families and dependents, would swell the number of potential beneficiaries to over 100 million, depending of course on the type of coverage

embraced in the system. The number of illnesses per hundred members in Germany ranged over the period 1925 to 1934 from 0.6 to 52.4 which would suggest something approaching 50 million cases per year in the United States. All of these cases would have to go through the process of certification, filing, inspection, payment, complaints and adjustments. If an adequate field and inspection staff were not provided, it would mean wholesale profiteering at public expense. If an adequate staff and organization were provided it would mean an army of government employees." Doctor does your general opinion coincide with the statements made in the book I have just read from? DR. MILLER: Yes, there must necessarily be a large number of federal employees to supervise this system.

DR. MILLER: Senator, you would not change the shape of your nose or the color of your hair because you happen to be born of a certain group. You cannot change that in medical illnesses. You are born with a crack in the convolutions of your brain or you are not. When they get out of a groove and get into something else they crack up and go to pieces.

SENATOR MURRAY: But a lot of people crack up in this country because of the system that we have to live under whereby two or three hundred corporations rule the country and great masses of our people are denied adequate income on which to live and maintain their families and educate and care for their children and give them proper medical care. People crack up under that kind of a system too. DR. MILLER: Oh yes indeed they do. But the thing I am getting at in this compulsory medical program why confine it to medical care? Why not go the whole gantlet and give housing and food and completely regimentize and sovietize the American people. If that is what the majority want that is what we will do.

SENATOR MURRAY: The majority want a democratic system. They do not want a system whereby two or three hundred corporations rule the country or whereby monopolies are expanded to such a degree that the great masses of the people are unable to live with any degree of prosperity and good health. I think the trend toward collectivism in this country has been brought on by industry. The great growth power wealth of corporations and the monopolies of the country they are things that have brought these conditions to prevail in this country more than the people have. The people are seeking to avoid it. They want to live under democracy.

SENATOR DONNELL: Mr. Chairman, pardon me a second. I would like to have the record show that my silence here is not any agreement to the proposition that this country is ruled by three hundred corporations.

SENATOR MURRAY: I do not think that is necessary because the record is pretty well filled with evidences of your desire to oppose and I have given you full liberty to oppose and I welcome all of your cross examinations and your efforts to examine the problem thoroughly.

### Statement of Leonard W. Mayo, Chairman, National Commission on Children and Youth, Accompanied by Henry F. Helmholz, M.D., Section on Pediatrics, Mayo Clinic

MR. MAYO: I appear in behalf of and with the authority of the National Commission on Children and Youth, formerly the National Commission on Children in Wartime. This commission is composed of approximately 100 men and women prominent in education public health, medicine, social service labor and civic activity. Such groups as the American Association of University Women, the Child Welfare Division of the American Legion, the National Council of the Young Men's Christian Associations, the National Committee for Mental Hygiene, the National Congress of Parents and Teachers, labor unions and the American Farm Bureau Federation are represented on the commission, plus some other organizations. The original commission was appointed in March of 1942 following a meeting called by the United States Children's Bureau of the Department of Labor to consider the critical and emergency problems of children during wartime.

*(Mr. Mayo presented data compiled by the commission with respect to the need for increased maternal and child health services and for services to crippled children.)*

The members of the commission are persuaded that every child born under the American flag is entitled to the best and most skilful medical care our country can provide, regardless of the size of his father's pocketbook. The commission has estimated that for the fiscal year 1946 the maximum authorized for appropriation from federal funds for grants should be raised by approximately 50 million, 25 million of which should be allocated to maternity care and care for infants and preschool children, 15 million to preventive and corrective health services for children of school age and 10 million for dental care. It is further recommended that federal funds for crippled children's services should be increased by at least 25 millions broken down as follows: for orthopedically crippled children, including those with cerebral palsy, 5 million, for children with other physically handicapping conditions, 5 million for children with rheumatic fever and heart disease 15 million.

*(Senator Donnell brought out that the group was selected by Miss Lenroot.)*

SENATOR DONNELL: Had there been some criticism you had heard of directed against the commission on the ground that it was the organ of the Children's Bureau in lobbying affairs lobbying matters? MR. MAYO: I never heard that. As a matter of fact the commission had not lobbied, and I did not hear that criticism.

SENATOR DONNELL: Was its function at or about 1944 and from then until the present time largely the influencing of legislation? MR. MAYO: I would say not. I would say that its purposes and functions throughout have been largely to bring together information with the hope that that information would so inform and equip competent and knowledgeable persons and groups in the country that they might on their own, take such steps as their wisdom and discretion indicated in providing more adequate services for children.

*(Senator Donnell brought out that Miss Lenroot's appointee acts as secretary for the committee headed by Mr. Mayo.)*

MR. MAYO: She is on the staff of the bureau.

SENATOR DONNELL: Except that she is on the staff of the Bureau and is paid by the Bureau and not by the Commission? MR. MAYO: That is correct.

SENATOR DONNELL: You have stated that the commission has no funds, I believe. Am I right in that? MR. MAYO: That is right.

SENATOR DONNELL: Who pays the expenses of the National Commission on Children and Youth? MR. MAYO: The printing of such material as you see here has been done by the Children's Bureau.

SENATOR DONNELL: Do you know who paid the expenses of the circulation of it [a pamphlet]? MR. MAYO: I take it that the Children's Bureau did. I do not know to the contrary.

SENATOR DONNELL: With the exception of the traveling expenses to which you referred, and the expenses of mimeographing your own testimony here today, is it a fact, Doctor, that all the expense of the National Commission on Children and Youth within the last year has been paid for by the Children's Bureau of the United States Department of Labor? MR. MAYO: I would add there are other office expenses borne by the Child Welfare League carried on in my office, such as mailing out letters. I take care of the postage and we share it in that way.

SENATOR DONNELL: But the Children's Bureau of the United States Department of Labor has paid the expenses along the lines of what you have indicated? MR. MAYO: That is right.

SENATOR DONNELL: And the commission itself has no resources whatsoever is that right? MR. MAYO: Has no resources of its own.

SENATOR DONNELL: Doctor, do you not think it would be somewhat more fair to the general public to reveal in the name of the commission the fact of its very close connection financially and otherwise with the Children's Bureau, so that the country might understand clearly that this commission is actually extremely closely related to a governmental organization the Children's Bureau of the Department of Labor, which understanding of course is not obvious at all from the name which the commission now bears? MR. MAYO: From the reports from the paragraph you read in this booklet, which, as I stated has been distributed all over the country, it is pretty clear, of course.

SENATOR DONNELL: Well, I do not think Doctor, with all due respect that the name of the organization namely the National Commission on Children and Youth is at all descriptive of the fact that this organization is very closely affiliated with the Department of Labor, and I do not mean this critically. MR. MAYO: That is all right.

SENATOR DONNELL: Following a meeting but I do not observe any statement here as to who it was appointed the commission nor any of the facts that have been developed this afternoon as to the financing of the commission. I simply present to your consideration the query for your own judgment or response, such as you may deem proper as to whether you do not think it would be somewhat more fair to the public

if the name given to your organization preserved, as it did at the outset, the name "Children's Bureau" as a part of the name so that everybody could know that this was closely affiliated with a governmental department That would be a policy of utmost frankness, would it not, to the public? MR. MAYO Mr Chairman I think there are a good number of rather distinguished precedents in the country by which organizations that have been promoting the same general purposes and goals of other organizations have continued without a name which indicated originally affiliation of some kind I think that both ways are perfectly honorable and above board, and I really have no apology for the name of the commission as it now stands

SENATOR MURRAY Doctor, all these men whose names have been mentioned by the Senator examining you are men of high standing and reputation in the United States, are they not? MR. MAYO The highest sir

SENATOR MURRAY I noticed that in your statement here you say that the original commisison was brought together for the purpose of considering the critical and emergency problems of children during wartime? MR. MAYO Yes sir

SENATOR MURRAY Was there any other and sinister, motive in bringing those people together at that time? MR. MAYO There was no motive, sir other than the one you have stated To get an objective view from persons throughout the country who had some knowledge of the situation of what this nation was doing by way of furnishing adequate protection for its children during wartime That was its stated open purpose

SENATOR MURRAY That organization was not built up for the purpose of perpetuating any officials in their term of office in the Children's Bureau, was it? MR MAYO Not at all and I would say there is no one on the commission that has the least interest in such a matter

### Statement of Dr Helmholz, Chief of Section of Pediatrics, Mayo Clinic, Rochester, Minn.

SENATOR MURRAY I wish you would tell me whether your work at the Mayo Clinic should be classified as the practice of medicine DR HELMHOLZ I do not see how else you could classify it.

SENATOR MURRAY What is your work there? DR HELMHOLZ My work consists in seeing patients, some of them at their home, most of them at the clinic, as I would see patients in private practice anywhere.

SENATOR MURRAY Are you paid on a fee system or on a salary basis? DR HELMHOLZ I have been on a salary ever since I entered the Mayo clinic in 1921

SENATOR MURRAY Does the fact that you are on a salary instead of on a fee system have any effect of bringing about a deterioration in your services or your ability to render services? DR HELMHOLZ Only as twenty five years may have decreased my efficiency I might say that our department has grown from an original registration of about 1,800 to about 7 500

*(Dr Helmholz described the work of the Mayo clinic)*

SENATOR MURRAY Doctor you have given a great deal of study to the care of children have you? DR. HELMHOLZ Yes

SENATOR MURRAY From your experience in the Middle West do you think that children get all the medical care they need? DR HELMHOLZ No

SENATOR MURRAY In what way is the care defective or deficient? DR. HELMHOLZ I think probably as important as anything is the distribution of the pediatricians There the pediatrician is in a dilemma because he says that only the pediatrician can give good care to the child and yet he as a group has taken care of only about 10 to 20 per cent of the children of the country, and the other 80 to 90 per cent are taken care of by the general practitioners This distribution in rural communities communities of 10 000 and less, contains 4 per cent of the pediatricians In cities of 10 000 and over, 96 per cent of the pediatricians are practicing

SENATOR MURRAY Are there other diagnostic clinics like the Mayo Clinic, where children are seen by a pediatrician? DR HELMHOLZ Yes, university clinics are possibly the best example of places where good pediatric care is given. That is a point I think we should stress That a university clinic is a clinic in which the best possible things are don and the attempt is made to do things better another way of saying that research is one of the fundamental necessities for good medical care. You will find wherever research is being done, there good medical care is being given

SENATOR MURRAY Are there enough diagnostic clinics to meet the need for this kind of care for children? DR. HELMHOLZ I think that was well covered before a Senatorial committee that made its report, I think in 1944 That probably the entire country should be subdivided into units the center of which would be a diagnostic clinic, in which all the very complete medical services can be given In extending to the periphery, where you finally meet the general practitioner who has available a health center of some kind, there is a gradual increase in the availability of procedures that are helpful in diagnosis In other words, the entire country should have available a diagnostic clinic, wherever necessary And I might say that according to Dr Bachmeier, the director of the Hospital Survey, probably from 75 to 80 per cent of medical care can be given at the level of the general practitioner In other words, it is 25 per cent that need greater diagnostic facilities than are available to the general practitioner who is practicing in a small health unit

SENATOR MURRAY Do you believe that we should have some kind of a national system whereby medical care could be brought within the reach of people at the present time denied proper care because of financial conditions? DR HELMHOLZ I think so definitely As to how that shall be done I will admit that in my study of it I have not been able to arrive at anything It looks as though it could be done in a number of ways, but to me it always comes back to the fact that some agency other than the individual will have to step in and help if we are going to take care of all children and all mothers, and that is what we are trying to do

In that connection I think this might be interesting because the Senator mentioned the study that is being made at the present time by the Academy of Pediatrics I might say that I was chairman of the committee of nine representing the Academy of Pediatrics, the American Pediatric Society and the agency of the Children's Bureau I might say that that survey is at present being conducted and a study made of personnel, physicians health officers and technicians in all the counties of all the states in the country, as well as of all facilities hospitals, health centers and health departments in these same areas

*(Senator Donnell asked questions comparing European and American medicine and Dr Helmholz described the growth of pediatrics in the United States)*

SENATOR DONNELL And that level has risen in our own country more rapidly has it not than generally speaking in the other countries of the world? DR HELMHOLZ Exactly The advantage of the German system, which was leading the world before World War I was not dependent on the good service that the average man was getting I had an opportunity in Hardman's clinic to see what I would have considered a fourth year medical student at Hopkins who stood there and did not know a thing The education they got was inferior even at that time to what we were getting at Johns Hopkins But their system of assistanceships in the clinics developed a superior group of men who were outstanding who did the research of the time who were leaders in the profession There were a dozen men in Germany that were way above any one that we had in this country as to their contributions to medicine But it was not the level of their general practice even at that time

SENATOR DONNELL Doctor getting back to our own country there has been a very great advance in medicine in our own country, has there not? DR HELMHOLZ Yes

SENATOR DONNELL And today the medical profession in our country certainly compares favorably with the medical profession in any country in the world, does it not? DR HELMHOLZ Yes

SENATOR DONNELL And by "favorably" you mean, do you not Doctor, that our medical profession in this country excels generally speaking the medical professions of the other nations in the world? DR HELMHOLZ As far as I know, they are giving better service.

SENATOR DONNELL I am correct in my statement, am I not that the medical profession in the United States does excel over the medical professions in other countries of the world? Is that correct? DR. HELMHOLZ Yes I would like to put it this way though That that is no reason for not continuing to do even better work. That is why I introduced that element of the Minnesota maternal mortality statistics

SENATOR DONNELL I think we can all agree that in the professions of law medicine and any other we should strive for greater achievement than we have had in the past The point I make is that the medical profession has, by the policy of personal initiative and enterprise and desire to excel in this country shown the ability to make itself superior to the medical professions of other countries of the world. That is true is it not Doctor? DR. HELMHOLZ Yes

*(To be continued)*

(PHYSICIANS WILL CONFER A FAVOR BY SENDING FOR THIS DEPARTMENT ITEMS OF NEWS OF MORE OR LESS GENERAL INTEREST SUCH AS RELATE TO SOCIETY ACTIVITIES NEW HOSPITALS, EDUCATION AND PUBLIC HEALTH)

## CALIFORNIA

**Personal**—Dr Philip K Gilman, San Anselmo, has been named to direct a statewide survey of California hospitals which was authorized by the recent legislature at the request of the governor

**Wallet Size Birth Registration Card**—Persons born in San Francisco may now obtain a new certification of birth registration card, 2½ by 3½ inches in size, from the department of public health, 101 Grove Street San Francisco The new card, available June 15 gives information concerning the name, date of birth, sex and race as shown on the original birth certificate and the date on which the certificate was filed Medical details and personal information regarding parents are not transcribed from the original certificate The wallet size certification is made on green safety paper and may be used for identification proof of citizenship and establishment of age It is issued as an alternative to the complete copy of the birth certificate The usual legal fee of one dollar is required for either the card or a detailed copy of the birth certificate Applicants should specify the type of record desired and should furnish the name of the child as it was given on the original certificate date of birth name of father and maiden name of mother

## CONNECTICUT

**Survey of Medical Service**—The committee on rural medical service of the Connecticut State Medical Society has undertaken a study of the availability and adequacy of medical service for residents of rural areas in the state Questionnaires sent to over three hundred physicians engaged in predominantly rural practice will provide data on need for general practitioners and specialists, ambulance service, hospital beds, extension of public health services and school health services Participation of the rural population in Blue Cross and interest in a voluntary prepaid medical service plan will also be determined The committee members are Dr Norman H Gardner, East Hampton chairman Dr David H Bates, Putnam, Dr Gert S Gudernatsch Sharon, and Dr William H Upson, Suffield

## GEORGIA

**Public Health Meeting**—Dr Millard E. Winchester, Brunswick, health commissioner of Glynn, McIntosh and Camden counties, was named president-elect of the Georgia Public Health Association at its meeting in Atlanta in April Dr Abram J Davis, Augusta health commissioner of Richmond County, was inducted into the presidency and Mr Louva G Lenert, associate engineer, division of public engineering, Georgia Department of Public Health, was reelected secretary

## LOUISIANA

**Personal**—Dr Hiram W Kostmayer, professor of clinical gynecology Tulane University of Louisiana School of Medicine, New Orleans, has been elected to honorary membership in the Tulane History of Medicine Society——Dr Julius M Fernandez, Lafayette, has been appointed superintendent of the Charity Hospital in Lafayette succeeding Dr Paul H Kurzweg Jr, Lafayette, who has resigned to enter private practice

## MAINE

**Aid for the Physically Handicapped Children.**—The Maine Department of Education announces a group of summer courses designed to aid teachers in the education of children with physical handicaps The courses will be conducted between the summer sessions of Gorham State Teachers College and the University of Maine. The general courses will deal with learning and teaching problems connected with the education of children who are handicapped by infantile paralysis, cerebral palsy, epilepsy, rheumatic fever, heart diseases tuberculosis or diseases of the eyes or ears, and special courses will include psychology and rehabilitation of the hard of hearing adult, theory and technics of teaching lip reading, practice course in teaching lipreading, speech pathology clinical methods in speech correction and education of physically handicapped children

## MARYLAND

**Medical Director Named for Seton Institute**—Dr Cuthbert H Rogerson, formerly medical superintendent of Cassel Hospital, Swaylands, England, has been elected medical director of the Seton Institute, which was formerly known as the Mount Hope Retreat, Baltimore. The name of the institute was changed in a reorganization (The JOURNAL, Dec. 15, 1945 p 1112) The rehabilitation of certain sections of the hospital has been completed, and patients are now being admitted under the new organization There are several vacancies on the staff especially for junior psychiatrists and for interns who are seeking opportunities for training in psychiatry The institute cares for acute and recoverable cases

**Fellowship for Study of the Rh Factor**—A fellowship has been established in the departments of medicine and obstetrics of the University of Maryland School of Medicine and College of Physicians and Surgeons, Baltimore, for study of problems relating to the Rh factor This fellowship will carry a stipend of $2,500 a year and will begin approximately September 1 The fellowship is sponsored by the obstetric and gynecologic section of the Baltimore City Medical Society Work is to be done in a special laboratory established for this purpose at the University of Maryland School of Medicine Interested applicants should communicate with the director of the Baltimore Rh Typing Laboratory, Dr Milton S Sacks, University of Maryland School of Medicine and College of Physicians and Surgeons, Baltimore 1

## MASSACHUSETTS

**New Director of Mental Deficiency**—Dr John T Shea, Foxboro secretary-treasurer of the Massachusetts Psychiatric Society, has been appointed director of mental deficiency and statistics in the Massachusetts State Department of Mental Health Dr Shea graduated at Queens University, Faculty of Medicine, Kingston, Ont., in 1929 He began his work in the state institutions in Belchertown as assistant physician and senior physician He was transferred to the Foxboro State Hospital and became its assistant superintendent in 1942

## MICHIGAN

***John Dorsey Heads Department of Psychiatry***—Dr John M Dorsey, director of the child guidance division of the Children's Fund of Michigan, has been appointed special professor and chairman of the department of psychiatry of Wayne University College of Medicine, Detroit, effective July 1 He succeeds Dr Heinrich A Reye, professor of neuropsychiatry, who is retiring after thirty years' service on the staff of the college of medicine, serving as chairman of the department for the past twenty-four years Dr Reye has been designated professor emeritus Dr Dorsey, who graduated at the State University of Iowa College of Medicine, Iowa City in 1925, has been associated with the Children's Fund since 1938

**Medical Veterans Organize**—The Medical Veterans of World War II has been organized in Wayne County with Dr Grover C Penberthy as president, Dr William Bromme vice president, Dr Nathan Brooks secretary and Dr James E Lofstrom treasurer, all of Detroit. Membership is composed of members of the Wayne County Medical Society and of members in good standing of adjacent county medical societies who are veterans of the medical departments of the recent war The objectives of the group are to assist medical veterans, further comradeship and perpetuate the ideals for which the medical veteran served his country There is at present an active membership of 650 with a potential membership of 1 100 when further demobilization of medical officers is carried out Twenty-five per cent of the delegate group from Wayne County to the state medical society house of delegates comes from this group

## NEW YORK

**Harold Himwich Joins Chemical Warfare Service**—Dr Harold E Himwich has resigned as professor of physiology and pharmacology at Albany Medical College, Union University, to become research physician, chief of clinical research branch Chemical Warfare Service, at the Edgewood Arsenal, Md, effective July 1

**Personal**—Dr Maurice L Tainter director of the Sterling-Winthrop Research Institute, Rensselaer, was elected a vice president of the Sterling Drug Inc May 23——Dr Arthur S Broga, Oneida, has been appointed coroner of Madison County, succeeding Dr Lee S Preston, Oneida, who resigned——Dr David E Bigwood Jr, assistant district health officer for the state department of health, with headquarters in Hornell, has been appointed health officer of Utica

### New York City

**Memorial Meeting for Simon Flexner**—A meeting was held at the Rockefeller Institute for Medical Research June 12 in memory of Dr Simon Flexner, who died May 2 The speakers were John D Rockefeller Jr, Learned Hand, LL D, Raymond B Fosdick, LL D, Dr Peyton Rous and Dr Herbert S Gasser

**Rockefeller Gift to Proposed Medical Center**—A gift of securities has been received from Mr John D Rockefeller Jr personally for the New York University-Bellevue Medical Center Campaign Fund and with it Mr Rockefeller's promise of a similar gift after $7 500,000 has been raised from other sources it was announced June 9 The present value of the securities received is approximately $500,000 It is the understanding that the half-way mark must be reached not later than Dec 31 1947 to meet the conditions of the second gift. The campaign goal is $15 000,000

**Report on Contraceptive Services.**—A report has been issued by the committee on public relations of the New York Academy of Medicine covering integrated studies on various aspects of contraceptive services In 1931 the committee reported the existence in Greater New York City of nine hospital contraceptive services in addition to several unlicensed extramural clinics and recommended the establishment of more services for contraceptive advice in connection with hospitals so that there would be no need for unattached extramural clinics that experienced gynecologists be placed in charge of these clinics and that medical centers as well as hospital clinics instruct physicians and students in modern contraceptive methods and in the indications for their use In 1945 a resurvey was made with emphasis on contraceptive services with attention in addition given to the sterility clinics because the two types of services are often integrated and because the Planned Parenthood organizations are beginning to emphasize this part of their program Of the eighty-nine general hospitals in Greater New York excluding Catholic hospitals to which a questionnaire was sent replies were received from seventy one A follow-up letter was sent to the administrative head of institutions from which there was no answer to the first letter and this resulted in nine additional replies From the total of eighty replies it was ascertained that there were only five hospitals in Greater New York which had special contraceptive clinics and that ten voluntary hospitals offered contraceptive services in connection with their gynecologic departments No contraceptive advice was being given in the other hospitals All the clinics were visited The medical part of the study was carried out by Dr Harry Aranow with the guidance and advice of a special subcommittee The recent report discusses the results of a survey of the five clinics and the type of services in each A total of 1 119 patients attended the five contraceptive hospital clinics during 1944 253 were new patients and 866 old patients At the Margaret Sanger Bureau located in a business district there were more than 30 000 patients during the same year it was stated. The report points out that the number of patients seeking contraceptive advice in hospital clinics is comparatively small in New York because it is generally believed that this procedure is illegal and therefore that such advice would not be available. New York law specifically permits physicians to give contraceptive information to cure or prevent disease The report presents statistical analyses of the contraceptive clinics planned parenthood centers Margaret Sanger Research Bureau the birth control clinics of the National Workers Order and the Judson Health Center and the sterility clinic in fifteen hospitals of Greater New York. In all these units suggest about twenty-eight organized places where a woman may apply for contraceptive advice instruction and the necessary supplies The report recommends among other things that child spacing should be recognized as a medical indication and that contraceptive advice should be given by well trained physicians both in their offices and in hospital clinics only when on the basis of a thorough medical study they are professionally and morally satisfied that such action is justified As family advice is a health service private physicians and hospitals as well as the proper health authorities should assume the responsibility of providing it. When contraceptive services have become a recognized part of hospital service in New York the Planned Parenthood centers should confine themselves to the education of the public and all education should be under medical supervision the report states Until such time as the hospital clinics take over contraceptive clinic service the Planned Parenthood organizations should continue to maintain contraceptive centers which conform to standards set up for licensure of dispensaries by the state board of social welfare, and the New York Academy of Medicine should strongly urge on the board that these centers be licensed because they are an important part of preventive medicine and because they cannot be otherwise controlled Other recommendations offer standards for financing, staffing and treatment

## OHIO

**New Institute of Nutrition**—Thomas S Sutton Ph D of the department of animal husbandry at Ohio State University has been appointed director of the newly established Institute of Nutrition and Food Technology to be operated by the university and the Ohio Agricultural Experiment station at Wooster The creation of the institute was authorized to coordinate research and studies in the fields of nutrition and food advances

## PENNSYLVANIA

**Physician Honored**—On May 11 a portrait of Dr Harold L Foss Danville, Pa, was presented to the George F Geisinger Memorial Hospital, Danville by the Association of Resident and Ex-Resident Physicians of the Geisinger Hospital Dr Foss has been surgeon in chief of the George F Geisinger Memorial Hospital since it was opened in 1915 The presentation was made by Dr Patrick J Kennedy Wynnewood president of the association and accepted in behalf of the hospital by Mr Frederick J Platt Scranton, chairman of the advisory board Dr William L Estes Jr Bethlehem president of the Medical Society of the State of Pennsylvania was the guest speaker for the occasion The portrait was painted by John Johansen of New York

**Schireson Case Still in Court**—On June 10 no opinion had yet been handed down in the case of Henry Junius Schireson and the Pennsylvania State Board of Medical Education and Licensure recently argued before the Supreme Court of Pennsylvania in Harrisburg A delay in bringing about the revocation of Schireson's license to practice medicine in Pennsylvania occurred in 1945 when an injunction was obtained restraining the state board from action This injunction was dissolved Nov 2, 1945 by Judge Karl E Richards in the court of common pleas of Dauphin County Through this action the court upheld the contention of attorneys for the board that a state licensing body had the inherent right to revoke a license obtained by fraud (THE JOURNAL Nov 24 1945 p 895) The court also refused to accept Schireson's contention that the board was guilty of laches in attempting to revoke a license which had been issued some thirty years earlier In a subsequent hearing the Dauphin County Court overruled and dismissed the exceptions filed by the plaintiff

### Philadelphia

**Faculty Changes at Woman's Medical College**—The title professor emeritus has been granted to Drs John S Rodman Julia F S Fetterman and Margaret C Sturgis Dr Lewis K Ferguson who at one period during the war served as chief of surgery on the U S S *Solace* and who recently has been clinical professor of surgery at the University of Pennsylvania Graduate School of Medicine has been appointed professor of surgery succeeding Dr Rodman Dr Stanford W Mulholland associate professor of urology at the college since 1939 has been appointed professor of urology to succeed Dr Fetterman An official release indicated that Dr Mulholland will also fill Dr Fetterman's position as medical director on the faculty Dr Mary D Pettit instructor in gynecology and obstetrics Albany Medical College Albany N Y has been appointed professor of gynecology succeeding Dr Sturgis Marion S Fay Ph D is acting dean at Woman's Medical College, having served in that capacity in the absence in military service of Dr Margaret D Craighill dean, who has now resigned

## TENNESSEE

**Twenty-Five Year Postgraduate Program.**—At the 1946 session of the Tennessee State Medical Association in Knoxville recently the committee on postgraduate medical education and the board of trustees approved a twenty-five year financial plan leading to permanent establishment of postgraduate study in Tennessee. The committee is now calling on medical societies throughout the state to make a complete member canvass for contributions from physicians to the program The plan calls for $1 000 contributions from one hundred doctors as an initial effort. Receipts will be issued for all contributions because they are deductible from income tax returns Other plans and sources of revenue for the creation of this fund will be described in a small booklet which will shortly be printed and placed in the hands of the entire profession All will be given an opportunity to make some contribution. Dr W C Colbert, Memphis was elected as the next chairman for the

postgraduate committee for the program "Neuropsychiatry for the Years 1947-1948' The Commonwealth Fund of New York sponsored a pilot course in psychiatry at the University of Minnesota which, it is hoped, can be duplicated in Tennessee In the medical state journal credit is given to the Commonwealth Fund for its many years of support to postgraduate education consisting of more than $100 000 in Tennessee and for its offer to continue assistance with a reduced amount for the next program in neuropsychiatry until the profession can set up its own funds

**Committee Named on Unauthorized Practice**—A committee on unauthorized practice of the healing art has been created through legislative resolution Members of the committee are Dr Robert H Hutcheson Nashville state commissioner of public health, and four lay persons Mr Carmack Cochran, Nashville Trust Building, Nashville Mr George Sheats, Baptist Memorial Hospital Memphis Professor J E Windrow Peabody Demonstration School Nashville and Mr W P Taylor 514 South Gay Street Knoxville The committee will undertake to ascertain whether or not there is 'unauthorized practice of the healing art and various branches thereof" in Tennessee The joint resolution on which the legislative action was based indicated that because of an acute shortage in Tennessee of persons licensed to practice the healing art in its various branches and a similar shortage of hospital facilities including nurses technicians and others brought about by the response of Tennessee to patriotic appeals, unscrupulous persons have unlawfully been holding themselves out as licensed to practice the healing art

**Essay Award Goes to Yale Physician.**—Dr Arthur J Geiger assistant professor of medicine Yale University School of Medicine New Haven, is the winner of the 1946 annual essay contest of the Mississippi Valley Medical Society 'for the best unpublished essay on a subject of practical and applicable value to the general practitioner of medicine.' Dr Geiger s subject was Penicillin Therapy in Subacute Bacterial Endocarditis Second prize was awarded to Dr Frederick Steigmann of the University of Illinois Chicago, for his essay The Problem of Jaundice in General Practice and third prize to Dr Rutherford T Johnstone Los Angeles for his essay A Basic Approach to the Diagnosis of the Occupational Diseases Dr Geiger will receive $100 a gold medal and a certificate of award He will deliver his essay at the eleventh annual meeting of the Mississippi Valley Medical Society Jefferson Hotel St Louis September 25 27

**Teaching of Physics for Students of Biology and Medicine**—Following a recommendation from the scientific advisory committee of the Baruch Committee on Physical Medicine to the executive committee of the American Association of Physics Teachers, a committee of three members of the association has been formed to assist in a more effective teaching of physics for premedical students and students of biology Members of the committee are Lester I Bockstahler, Ph D, Evanston, Ill, Louis A Strait, Ph D, Austin, Texas, and LeRoy L Barnes Ph D, Ithaca N Y, chairman The committee will assemble and make available to teachers of the first course in college physics illustrative material from biology and medicine which will show physical principles at work in biologic processes and physical principles applied in the study of biologic processes, and a second course in physics for students of biology and premedical students The committee invites suggestions from biologists physicists and physicians interested in the project and requests that all communications be sent to Dr Barnes, Rockefeller Hall, Ithaca, N Y

**Life Insurance Research Fund Awards Fellowships**—On June 19 the Life Insurance Medical Research Fund awarded *nine fellowships, totaling $23,000 for postgraduate research and* student training Award of the fellowships the first to be made by the fund coincided with the approval of eleven new grants totaling $162,000 to ten institutions for research in this field These grants and awards bring to $621 000 the allocations for research made by the fund since it was formed (THE JOURNAL, June 23, 1945 p 606) Two types of fellowships are granted by the fund The senior fellowships are given to graduates who have a doctor s degree in medicine or the related medical sciences Junior fellowships are awarded to undergraduate students in medical schools who desire to take an extra year for training in scientific research It is hoped that this program may serve to increase the number of research workers particularly in view of the accumulated deficiency of such workers which developed during the war Fellowships are open to residents of the United States and Canada Senior fellows usually receive $2 500 to $3 500 a year, while junior fellows are given $1,500 to $2,000 a year It is expected that additional fellowships will be awarded later this year Of the nine fellowships just awarded, four are for postgraduate research into cardiovascular diseases and five are to medical students for training and research The postgraduate fellowships to be available in 1946 were made to

Dr Louis Horlick Montreal Que provided satisfactory arrangements are made for him to work in the field of cardiovascular physiology
Dr Jacob H Milstone Yale University School of Medicine New Haven
Dr Roy L Robertson Emory University School of Medicine Atlanta
Dr Kenneth F G Savard University of Montreal Faculty of Medicine Quebec

Student fellowships were awarded to

Cus G Casten Southwestern Medical College
George T Shires Southwestern Medical College
Donn L Smith University of Colorado School of Medicine provided course work is satisfactorily restricted
Lloyd H Smith Harvard Medical School Boston
William G Turman Syracuse University College of Medicine

Eight of the new grants are for study of the physiology of circulation or circulatory dynamics The institutions to which the grants were made and the research workers involved as announced by M Albert Linton chairman of the fund are as follows

Dr Tzvee N Harris for study of rheumatic fever Children s Hospital Philadelphia
Dr Katharine K Merritt for study of congenital heart diseases Columbia University College of Physicians and Surgeons New York
Dr Clinton H Thienes for study of the reaction on circulation University of Southern California School of Medicine Los Angeles
Dr René Wegria Columbia University College of Physicians and Surgeons New York
Dr Eugene A Stead Jr Emory University School of Medicine Atlanta Ga
Dr William Dock and Dr Jean R Oliver Long Island College of Medicine Brooklyn
Dr Carl F Schmidt University of Pennsylvania School of Medicine Philadelphia
Dr Arabian N Taylor University of Texas Medical Branch Galveston
Dr George E Burch Tulane University of Louisiana School of Medicine New Orleans
Dr Harold D Green Bowman Gray School of Medicine of Wake Forest College Winston Salem N C
Dr Cyril N H Long and Dr John V Brobeck, Yale University School of Medicine New Haven

Dr Francis R Dieuaide is scientific director of the Life Insurance Medical Research Fund (THE JOURNAL April 6 p 959) He is clinical professor of medicine at Columbia University College of Physicians and Surgeons On July 1 the office of the Life Insurance Medical Research Fund will be established at the New York Academy of Medicine 2 East 103d Street New York The fund is supported by 149 legal reserve life insurance companies in the United States and Canada the 139 United States contributing companies representing 93 per cent of the life insurance in force for all United States companies

## CORRECTION

**Dialyzed Milk.**—In a Query and Minor Note with this title (THE JOURNAL, May 25 p 366) it is stated that a quart of milk contains 5 Gm of sodium. This should have read 0 5 Gm

# Deaths

**Hal Lovelace Foster** ⊕ Kansas City, Mo University of the City of New York Medical Department, 1882 born July 7, 1858 founder, secretary from 1896 to 1898 and vice president in 1920 of the American Academy of Ophthalmology and Otolaryngology, honorary member of the Missouri State Medical Association, charter member and second secretary of the Jackson County Medical Society, charter member of the Kansas City Southwest Clinical Society, charter member and past president of the Kansas City Academy of Medicine charter member of the Kansas City Society of Ophthalmology and Otolaryngology fellow of the American College of Surgeons, consulting otolaryngologist St Margaret s Hospital in Kansas City Kan , visiting otolaryngologist to St Joseph s and Trinity-Lutheran hospitals, first secretary of All Saints' Hospital now St Luke s at a dinner given in April 1945 an oil portrait of him was unveiled as a memento of the fiftieth anniversary of the American Academy of Ophthalmology and Otolaryngology died May 21, aged 87, of cardiorenal disease

**Alexander Berkeley Moore** ⊕ Washington D C University of Virginia Department of Medicine Charlottesville, 1907, born in Aldie Va Nov 6, 1883 specialist certified by the American Board of Radiology, member of the American Roentgen Ray Society and past president American Gastro-Enterological Association Radiological Society of North America Inc Alumni Association of the Mayo Foundation and the American College of Radiology fellow of the American College of Physicians in December 1910 entered the Mayo Clinic in Rochester Minn as an associate in roentgenology and later became head of the section served as an associate professor of roentgenology at the University of Minnesota Graduate School Minneapolis Rochester, formerly professor of roentgenology at the Georgetown University School of Medicine a captain in the medical corps of the U S Army during World War I radiologist Central Dispensary and Emergency Hospital died March 8 aged 62 of pulmonary embolism

**Robert Glenn Allison** ⊕ Minneapolis University of Maryland School of Medicine Baltimore 1912 born in York S C Nov 25 1887 clinical assistant professor of radiology at the University of Minnesota Medical School and the University of Minnesota Graduate School, specialist certified by the American Board of Radiology member of the American Roentgen Ray Society Radiological Society of North America Inc and the American College of Radiology served during World War I formerly on the staffs of the Trudeau (N Y) Sanatorium Municipal Tuberculosis Sanitarium Chicago and Harper Hospital Detroit on the staffs of the Glen Lake Sanatorium Oak Terrace Minn Abbott Hospital Asbury Hospital and the Northwestern Hospital where he died March 20 aged 58, of cerebral hemorrhage

**Frederick Jerome Walter** ⊕ San Diego Chicago Homeopathic Medical College 1897 College of Physicians and Surgeons of Chicago School of Medicine of the University of Illinois 1904 born in Bureau County, Ill Nov 11 1874 past president of the Florida Medical Association and the Volusia County Medical Society served as president of the Daytona (Fla ) and La Mesa (Calif ) school boards examiner for the Los Angeles induction board during World War II, at one time medical director of Mudlavia Sanitarium in Kramer Ind member of the Florida Railroad Surgeons Association and surgeon for the Florida Railroad died in the Scripps Memorial Hospital, La Jolla, February 14 aged 71 of heart disease and lobar pneumonia

**George Walter Caldwell,** Los Angeles, University of Denver Medical Department 1891, born in 1866 in 1892 affiliated with the New Amsterdam Eye and Ear Hospital in New York, instructor in ophthalmology and assistant in rhinology and laryngology at the New York Polyclinic 1893-1894 and ophthalmic and aural surgeon to Convent and School of the Sisters of St Dominic in Blanvelt N Y, 1893-1894, clinical instructor at San Francisco Polyclinic nose and throat department 1912-1913 on the clinic staff of the Lane Hospital of Stanford University, San Francisco nose ear and throat department 1913 1914 author of several books, died March 11, aged 79 of heart disease

**Raymond Howard Schroeder** ⊕ Dayton, Ohio Ohio State University College of Medicine, Columbus, 1938 interned at St Francis Hospital in Columbus served a residency at the Ohio Hospital for Epileptics Gallipolis and the Licking County Tuberculosis Sanatorium in Newark, began active duty as a first lieutenant in the medical corps Army of the United States on Sept 29 1942 promoted to captain, served for twenty-six months in China as flight surgeon for the 16th fighter squardon held the air medal with citation and four major battle stars, separated from the service on February 24, died March 30, aged 32

**Jesse Hall Allen** ⊕ Philadelphia University of Pennsylvania Department of Medicine, Philadelphia 1897, assistant professor of proctology at Jefferson Medical College specialist certified by the American Board of Surgery member of the American Proctologic Society, on the staffs of the Broad Street and Methodist hospitals, died in the Jefferson Hospital April 16 aged 77 of cerebral vascular disease

**Francis Joseph Lorraine Barthelme** ⊕ Effingham Ill St Louis University School of Medicine, 1923, began active duty as a captain in the medical corps Army of the United States, on Sept 22 1942 service terminated in November 1943, died in St Anthony's Hospital March 8 aged 48

**Louis Berman** ⊕ New York, Columbia University College of Physicians and Surgeons, New York, 1915, from 1921 to 1928 associate in biologic chemistry at his alma mater, visiting endocrinologist and once visiting neurologist at the Central Neurological Hospital, among his many books were the "Glands Regulating Personality" "Food and Character the 'Personal Equation" 'New Creations in Human Beings' and 'Behind the Universe of a Doctor s Religion' , died May 16 aged 53, of heart disease

**Robert Emmett Bryan,** Elkins W Va Jefferson Medical College of Philadelphia, 1882, died March 11, aged 85 of senility

**Jesse R Bryant,** Wausau Wis , Rush Medical College Chicago 1896 also a graduate in pharmacy , served with the state national guard and during World War I, died February 12 aged 78 of cerebral hemorrhage

**James Bell Bullitt** ⊕ San Jose Calif University of Louisville Medical Department 1889, an Affiliate Fellow of the American Medical Association specialist certified by the American Board of Radiology, member of the American Roentgen Ray Society of which he had been past president and the American College of Radiology, on the staffs of the Santa Clara County Hospital and the San Jose Hospital died February 25 aged 82, of aplastic anemia

**C J Campbell,** Mulberry Ark (licensed in Arkansas in 1903), member of the American Medical Association died February 28, aged 69, of coronary occlusion

**Francis Smith Clark,** Louisville, Ky , University of Louisville Medical Department 1892 member of the American Medical Association, died February 20 aged 77, of coronary sclerosis

**Sarah A Cole,** Lincoln, Kan State University of Iowa College of Homeopathic Medicine Iowa City 1889, the Hahnemann Medical College and Hospital, Chicago, 1898 died February 20 aged 90 of fracture of the femur sustained in a fall

**Silas Melvin Compton,** South Bend Ind , Indiana University School of Medicine, Indianapolis, 1909, died in St Joseph Hospital March 5 aged 68 of lobar pneumonia

**William Borden Conner** ⊕ Rochester, N Y , University of Pennsylvania Department of Medicine, Philadelphia, 1900, member of the Rochester Academy of Medicine and the Rochester Pathological Society on the staffs of the Highland, St Mary s and Genesee hospitals, died in the Strong Memorial Hospital February 24, aged 69, of carcinoma of the urethra.

**Albert Lloyd Cooper** ⊕ Scottsbluff, Neb , University of Nebraska College of Medicine Omaha, 1919 president of the Nebraska State Medical Association in 1943, for many years councilor of the Twelfth District Medical Society past president of the Scotts Bluff County Medical Society, served on the city council, died in a hospital at Kearney February 18, aged 56 of burns received in an airplane crash at Elm Creek.

**Fannie Wooten Cowle,** Hot Springs National Park, Ark., University of Nashville (Tenn.) Medical Department, 1899, died February 21, aged 84, of chronic nephritis

**Walter Roland Cox** ⊕ Memphis, Tenn , Memphis Hospital Medical College, 1908 died in St. Joseph Hospital February 11, aged 60, of cerebral hemorrhage

**Charles Woodhouse Crompton,** Hoquiam Wash , New York Homeopathic Medical College and Hospital, New York, 1891 died January 18 aged 76

**William Simon Crowley,** Oak Park Ill , Northwestern University Medical School, Chicago 1909, died in February, aged 61

**Cyrus Richardson Currier** ⊕ Lieutenant Commander, U S Navy, retired Sandwich Mass, Tufts College Medical School, Boston, 1911, U S Naval Medical School in 1934, entered the U S Navy in 1921 and retired Dec. 1 1942 for incapacity resulting from an incident of service, died April 9, aged 58 of coronary thrombosis

**Thomas Greene Curry,** Franklin, Texas, Kentucky School of Medicine, Louisville, 1894 member of the American Medical Association, died January 15 aged 79

**Clinton Day** ⊕ Hart, Mich Ensworth Medical College St Joseph, Mo, 1891 served during World War I, died February 26, aged 81, of arteriosclerosis

**Wilborn John Deason,** Happy Camp Calif Chicago College of Medicine and Surgery 1914, died in the Siskiyou County General Hospital, Yreka, February 25 aged 67

### Consultants, Specialists and the National Health Service Bill

The bill for a national health service is now passing through the committee stage in the House of Commons The government is making amendments of a minor nature, but those from the opposition are rejected As the bill affects consultants as well as general practitioners meetings of the former have been held to consider it The Consultants and Specialists Group Committee of the British Medical Association has adopted a number of resolutions The committee approves the principle of regional organization of hospitals, voluntary and municipal, by regional boards, but it holds that only in agreement with the Central Health Services Council should the minister of health have the right to refrain from laying the council's annual report before Parliament The medical practitioners on the council, regional boards and hospital management committees should be appointed by the minister after consultation and agreement with the professional organizations concerned An endeavor should be made before the bill is passed to ensure that medical representation is adequate on the regional hospital boards Further efforts should be made to obtain a comprehensive health service by including the industrial medical service and the medical services of other government departments There is no proved necessity for the change of ownership of hospital buildings and equipment or of hospital endowments The minister should be pressed for an early statement of the retiring age from the service That part of a hospital which is already built specially or designated as a pay block should be used solely for that purpose Persons should not be able to avail themselves of the amenities of pay block accommodation without paying for the services of part time consultants attending them. From the medical staff of the hospitals a medical board should be elected by the medical staff with power to nominate an adequate number of their members to the hospital management committee. Every consultant or specialist on the staff of a voluntary or municipal hospital who enters the health service should be entitled to continuity of office on the staff of a hospital in the same area The right of private practice should be safeguarded and pressure exerted in order that a proportion of accommodation be reserved for private patients The right to continue as members of the staffs of the hospitals which they serve should be accorded to all consultants and specialists whether they enter the national health service or not Where a consultant or specialist can show that he has purchased a bona fide practice, the principle of compensation should be adhered to

### Annual Meeting of the Surgeons of Great Britain and Ireland

The annual meeting of the surgeons of Great Britain and Ireland, held in London, was made noteworthy by the attendance of a number of leading French and Belgian surgeons—Leriche, Bazy Santy Lortat-Jacob, Mathey, Berat, de Baiseux, Albert, Dejardin, Morelle Segound and Mayer The meeting was held under the presidency of Sir Max Page. At a dinner the president of the Royal College of Surgeons, Sir Alfred Webb-Johnson, in proposing the health of the guests, spoke of the emotion felt at this reunion after long years of trial and the admiration of British surgeons for the fortitude of their colleagues and their faith so difficult to keep burning What at great risk they had done for our men would never be forgotten In replying, Professor Leriche related how in the difficult years he read the works of the older English surgeons down to Sir Astley Cooper and was impressed with the unity of surgical thought The need of surgeons today was to break down isolation—to meet and work in common Sir Max Page welcomed the return of international surgery It was essential to encourage interchange of ideas to promote science. The director general of the Army Medical Service, Sir Alexander Hood, testified to the achievements of surgeons in the war By its effect on the morale of troops, efficient care of the sick and wounded contributed enormously to victory The presence of specialist surgical teams near the front had an immense influence

AMSTERDAM, May 6, 1946

### Estimation of 17-Ketosteroids

For more than twenty years the pharmacotherapeutic laboratory of the University of Amsterdam was engaged in research on sex and adrenocortical hormones Contributions toward the refining and characterization of estrogenic agents and the discovery and chemical identification of the male steroid testosterone were among the results achieved Since the late prewar years the nonbiologic estimation of sex steroids was included in the program During the last few years E. Dingemanse and L G Huis in the *Veld* elaborated a method of estimating 17-ketosteroids in the urine of patients and of normal persons, and the clinical application of this method is yielding valuable results

### Mortality from Tuberculosis in the Netherlands

Although the absolute figures are not very high in comparison with those of other countries, the rise of the mortality from tuberculosis during the war is considerable, as shown in the accompanying table

*Mortality from Tuberculosis*

| | 1928 1939 | 1937 | 1938 | 1939 | 1940 | 1941 | 1942 | 1943 |
|---|---|---|---|---|---|---|---|---|
| The Netherlands | 60 | 48 | 45 | 41 | 44 | 59 | 61 | 70 |
| Amsterdam | 56 | 44 | 41 | 35 | 37 | 60 | 71 | 75 |

### Gift of Penicillin by American Red Cross

The American Red Cross has given a billion units of penicillin to several Dutch hospitals The penicillin has been sent to the Netherlands by special aircraft

### Cancer Diagnosis

Dr van der Spek describes in the *Nederlandsch tijdschrift voor geneeskunde* **90** 360, 1946 the serologic method of diagnosing cancer This method has been elaborated by de Kromme and by de Bruine Groeneveldt Control tests have shown that the results were correct in 84 per cent of the cases The method is based on the demonstration of an antigen and of antibodies in the blood and urine of affected persons

### Miscellaneous

In March the University of Utrecht conferred the honorary degree of doctor of science on the phytopathologist Dr van Luijken for his research on antibiotics Investigating soils he isolated and cultivated Penicillium expansum, whose culture medium proved to contain an agent antagonistic to the fungus Pythium de Baranyum Exparsine is with reasonable probability identified as anhydro 3 oxymethyl-4 pyrone carbonacide and its identity with Raistrick's Patulin is probable.

The University of Groningen awarded an honorary doctorate in science to Prof J B S Haldane for his many contributions to physiology and biochemistry

Prof P Formijne has been reappointed to the Amsterdam chair of internal medicine, from which he resigned at the end of hostilities in the Netherlands last year

Winston Churchill is to visit the Netherlands from May 8 to 13 On May 10 Leiden University will confer on him an honorary degree of doctor On May 11 the golden medallion of the city of Amsterdam will be presented to him

## BRAZIL

*(From Our Regular Correspondent)*

RIO DE JANEIRO, May 22, 1946

### Intrathoracic Goiter

Dr Raymundo Britto has reported 1,400 cases of thyroid diseases treated at the Red Cross Hospital of Rio de Janeiro Seventy two of the 703 patients treated surgically presented intrathoracic goiter The biotype of the patient is significant in the etiology of intrathoracic goiter Of 95 such cases, 59 were of the hypersthenic type, 19 of the sthenic type and 17 of the asthenic type In only 4 of the 72 patients treated surgically was the goiter completely intrathoracic. Fifteen of the 95 patients with this disease were men and 80 were women. Twenty-six of them were from 31 to 40 years of age Seventy-seven patients, or 81 1 per cent, had hyperthyroidism Two cases of adenocarcinoma of the left lobe with hyperthyroidism were reported In almost all cases there was compression and deviation of the laryngotracheal tube predominantly on the left side, making laryngoscopy necessary Fluoroscopy, radiography and tomography were especially valuable for diagnosis In the 4 completely intrathoracic cases the cervical route was used for the operation with satisfactory results No postoperative complications or fatalities were reported. Sulfonamides and penicillin were administered during the postoperative period.

### Penicillin in the Treatment of Frambesia Tropica

Drs Nery Guimarães, Marques da Cunha and A. Area Leão of the Oswaldo Cruz Institute of Rio de Janeiro have been conducting for several months a series of experiments on the treatment of frambesia tropica (pain, yaws) Dr Guimarães has now published a fifth paper The report deals with investigations performed to ascertain (*a*) the minimal curative dose for the initial lesions of frambesia, (*b*) the effect of the reduction of the number of injections in each day and the possible application of penicillin in the control of the disease in rural districts and (*c*) reduction of the duration of the treatment by the use of high dosage

Clinical recovery was correlated with dosage of penicillin as follows (1) 150 Oxford units every four hours, seventeen days, (2) 50 units daily, no recovery (3) 400 units three times daily fifteen days, (4) 400 units two times daily twenty days, (5) 1 600 to 3,200 units daily, twenty to thirty days, (6) 33⅓ to 46 7 units per kilogram of body weight every four hours, fifteen days, (7) 61 5 to 166 7 units per kilogram of body weight every four hours, four days, (8) 20,000 units every four hours for five doses, no recovery

### Late Biochemical Variation of Shigella Alkalescens

Dr Arlindo de Assis, professor of bacteriology at the Fluminense School of Medicine of Niteroi state of Rio de Janeiro, published a report on the late biochemical variation of Shigella alkalescens types I and II Six strains of Sh alkalescens which had been tested on carbohydrates in 1939 were retested in 1946 on the same substrates (sucrose, rhamnose, dulcitol, xylose and salicin) No change occurred in tests with fermentations of sucrose, rhamnose and dulcitol The alkali producing Shigellae may be considered a heterogeneous group of bacteria which may be split into at least four antigenic types with disregard for their fermentative abilities Since the stability of these antigenic types is definitely greater than that of the usual fermentation tests, it seems desirable to classify Sh alkalescens cultures on a purely serologic basis in the future

### Medical Meetings

On July 1 to 5 the seventh Brazilian Congress of Orthopedics and Traumatology will be held at Rio de Janeiro Besides discussions by surgeons who served in the Brazilian Expeditionary Force in Europe, the program includes special reports on the treatment of congenital clubfoot by Dr Oswaldo Campos, Rio de Janeiro, and Dr Define Frasca, São Paulo, and on intrinsic fractures of the foot by Dr Guerra Blessman, Porto Alegre, and Dr Benjamin Salles, Bahia.

The first Inter-American Congress of Medicine, sponsored by the National Academy of Medicine, will be held at Rio de Janeiro on September 7 to 15 Many physicians and surgeons of the Americas have already accepted the invitation of the organizing committee to be present at the meeting, including Drs Malcolm MacEachern, Charles O Bruce Jr, George Pack, Samuel Soskin and Tracy Putnam from the United States The subjects to be discussed at the meeting are included in ten divisions hospitals and hospital organization medical and social aspects of immigration, war medicine and surgery, prevention and treatment of cancer, the great endemic diseases of the Americas nutriology and vitaminology, endocrinology, tuberculosis, neuropsychiatry, hygiene and public health

### Brief Items

Dr Mauricio C Medeiros has been appointed professor of psychiatry at the University of Rio de Janeiro succeeding Dr Henrique Roxo, who retired from active duty because of age

Dr Luis A Caprighone has been appointed professor of medicine at the University of Rio de Janeiro, succeeding the late Dr Heitor Annes Dias

## TOXICITY OF THIOGLYCOLIC ACID USED IN COLD PERMANENT WAVE PROCESS

*To the Editor* —The article by Dr. Lawrence H. Cotter on Thioglycolic Acid Poisoning in Connection with the 'Cold Wave' Process (THE JOURNAL, June 15, p. 592) contains some misstatements and contradictions that should be clarified as a part of any fair appraisal of the situation. Obviously, Dr. Cotter is necessarily unaware of extensive investigative work that has been carried out by manufacturers for evidence of sensitizing properties of cold wave material and also of measures for the appraisal of primary irritation of the skin.

1. Throughout the article there are statements and implications to the effect that thioglycolic acid as such is used in cold wave preparations. I do not know that any thioglycolic acid, as such, is ever used, all being neutralized or provided with an excess of alkaline material, either ammonium hydroxide, which may be undesirable, or with other basic material, which practice is preferable.

2. Dr. Cotter refers to "chemically pure" thioglycolic acid. There is no such substance as 'pure' thioglycolic acid in that hydrogen sulfide always is an immediate or ready decomposition product. It is possible to stabilize thioglycolic acid to the point that no, or only traces of, hydrogen sulfide are produced in which instance the stabilizing agent becomes the deviating substance from chemical purity.

3. Throughout the article emphasis is placed on positive cephalin flocculation tests. At one point the statement is made that a positive cephalin flocculation test suggests a chemical poison. Recourse to the publications of the originator of the cephalin flocculation tests, Dr. Franklin Hanger, fails to reveal any claim that this procedure is a test preponderantly for external chemical poisons. Rather it is an index of hepatic inflammation. In the totality of hepatic inflammation external poisons do not play a paramount role.

4. Of the cases cited it is probable that Dr. Cotter will concur in the belief that at and after the time he saw the first patient all significant manifestations were characteristic of x-ray damage, which x-ray burns with ulcers he emphasizes. For case 2 I find no sound evidence linking the condition described with thioglycolic acid. Some months after any exposure to thioglycolic acid the woman was under observation by Dr. Cotter. In case 3, iteration and reiteration is directed to the burning action of "acid." Appropriate inquiry would have established that no acid was present in the cold wave solution. If any acid was present in the circumstances, this would have been limited to the highly dilute acid that may have been utilized, as is customary, for the removal of the alkaline wave solution.

5. Claim is made that the cases chosen for publication were selected "because it had been possible to demonstrate their lesions in the laboratory." A review of these cases does in truth disclose some laboratory work and some indication of pathologic change, but I doubt that these "lesions" have through any shown proof been associated with thioglycolic acid as a causative factor.

At least one manufacturer to my knowledge has procured elaborate testing (1) to establish the degree of primary irritation of thioglycolic acid at various percentage levels, together with any similar effects of the alkaline derivatives as actually used in cold wave preparations, (2) to determine the possibilities of sensitization through repeated patch tests carried out at such intervals as are appropriate to the causation of sensitization, (3) appraisal of circumstances under which hydrogen sulfide is produced in the original thioglycolic acid and the procurement of stabilizers preventing this occurrence and (4) elaborate animal experiments in which thioglycolic acid and subsequently produced alkaline salts were applied or introduced under divers conditions. Such work I have carried out in Chicago, New York, Ann Arbor and Detroit. The totality of results suggests that

(*a*) There is no primary skin irritation from thioglycolic acid or alkaline derivatives at levels below 8 per cent.

(*b*) I have not seen evidence of sensitization and allergic responses with properly prepared materials under any circumstances.

(*c*) Hydrogen sulfide formation can be controlled through stabilization.

(*d*) In my tests measurable systemic responses have not occurred in animals after parenteral introduction.

Wholesale condemnation of all cold wave process materials is not, I believe, warranted.

CAREY P. MCCORD, M.D., Detroit.

## BLOOD PRESSURE IN HYPERTENSION

*To the Editor* —I have just read in the February 9 issue of THE JOURNAL the paper of Gubner, Silverstone and Ungerleider about the range of blood pressure in hypertension. Since I read the first communications about pressure and depressor tests I have proved their ability in my private practice and found them a useful aid in the evaluation of hypertensive and prehypertensive states. But I encountered some difficulty. Most of my patients did not cooperate satisfactorily in performing the pressor test, they did not stop breathing long enough to record the highest systolic pressure and repeating the test for reading the diastolic level was much more difficult. The authors of the paper also experienced this difficulty of maintaining apnea and therefore advised the brief inhalation of aromatic spirit of ammonia. I should like to draw attention to a simple but useful modification I used in the technic of the pressor test. The patient was instructed to make—as in breathing or "humming' exercises—an F or S sound with his mouth while exhaling and to prolong this expiration exercise as long as he could stand it. With this modification in producing apnea I never had difficulty in recording the systolic as well as the diastolic pressure in one single reading. Since I have used this modification of the pressure test I have never had to use inhalation of aromatic spirit of ammonia. *This modification is so simple and so satisfacory that it warrants further use.*

MAX NUSSBAUM, M.D., Petah-Tikwa, Palestine.

## THE RACIAL FACTOR IN DISEASE

*To the Editor* —In an otherwise excellent and timely paper on gout (McCrahen, J. P., Owen, P. S., and Pratt, J. H. Gout: Still a Forgotten Disease) the authors, in discussing race, state that approximately one half of the patients in their series were of American parentage and that the remaining racial groups were Jewish, Italian, Irish, English, German, Negro, Canadian, French, Austrian, Greek and Lithuanian.

It would seem almost supererogatory to point out the exceedingly misleading and falsely inferential nature of this statement. Aside from the fact that several of the categories are not at all mutually exclusive, all of them, with the possible exception of the Negro (and even here, possibly not so) are to a varying extent, including and perhaps especially the American and Jewish, diverse mixtures of widely varying origins. I do not know, and I doubt whether any one could tell with accuracy, the racial origin of a person "of American parentage" or a Jew residing in Boston (with or without American parentage) or of an Englishman. It would appear that there is a need for greater accuracy on the part of those who wish to deal with such data.

ARTHUR M. GINZLER, M.D., Baltimore.

# POSTGRADUATE CONTINUATION COURSES FOR VETERAN AND CIVILIAN PHYSICIANS

## Compiled by the Council on Medical Education and Hospitals for Period July 1, 1946 to Jan. 15, 1947

Medical schools, hospitals state medical societies and other medical educational institutions and organizations are providing the Council with a growing body of information on courses designed primarily to meet the needs of returning medical officers These have been incorporated into the lists on these pages They are not specifically designated for veterans, since most if not all of them may also be open to interested civilian physicians Furthermore, all courses listed which were not designed primarily for physician veterans are also open to qualified returning medical officers

Note that each course is listed only once, without cross indexing, so that in some instances a prospective student should look under more than one heading for a desired course

## MEDICOLEGAL ABSTRACTS

**Medical Practice Acts Uncorroborated Evidence of Employee of Medical Grievance Committee**—The Board of Regents of the University of the State of New York revoked the petitioner's license to practice medicine in that state On appeal to the appellate division the determination of the Board of Regents was annulled, from which judgment the Board of Regents appealed to the Court of Appeals of New York.

One of the reasons why the appellate division reversed the Board of Regents finding was that the two women who testified against the doctor were employed by the Medical Grievance Committee as paid investigators and that, like private detectives in divorce cases, they require corroboration, of which there was none The Court of Appeals said that where corroboration of private detectives is taken in divorce cases it is because of a generally accepted suspicion which does not apply to public employees No corroboration, said the Court of Appeals, was required here and the evidence of the two women investigators was sufficient The order of the appellate division was therefore reversed and the determination of the Board of Regents confirmed.—*Epstein v Board of Regents of University of New York, 65 N E (2d) 756 (N Y, 1946)*

**Dental Practice Acts Splitting Fees with Lay Solicitors**—Pursuant to a determination by the state board of dental examiners that the defendant, a licensed dentist, had been guilty of unprofessional conduct in the practice of his profession, and the approval of that finding by the Board of Regents the commissioner of education suspended defendant's license to practice dentistry for one year On appeal, the appellate division annulled the order of suspension and from such action the Board of Regents appealed to the Court of Appeals of New York

The defendant was licensed to practice dentistry in New York in 1919 In 1939 he employed a layman, who at no time had been licensed to practice dentistry in New York to contact prospective patients and arrange for their transportation to the defendant for dental treatment. This layman received a commission varying from 20 per cent to 50 per cent of the fees collected from such patients and from April 1939 to October 1942 he received about $20,000 from such sources plus $10 a week for maintenance of an automobile which he used for carrying patients to and from the defendant's office.

The education law, during the time involved in this suit, provided

> 2 The license and registration of a practitioner of dentistry may be revoked suspended or annulled upon decision and due hearing in any of the following cases (a) that the dentist has been guilty of immoral conduct (h) that the dentist has been otherwise or in any other way guilty of unprofessional conduct

It is urged by the defendant that, unless the Board of Regents prescribes by regulation the act which shall constitute unprofessional conduct, no dentist may be disciplined under section 1311, subdivision 2 clause (h) That never has been the law of this state, said the Court of Appeals It has never been necessary for the legislature or the Board of Regents to define with particularity acts which would constitute unprofessional conduct, whether in the fields of dentistry or of pharmacy In a prior case the court had pointed out that in vocations, like dentistry, more recently accepted as professions professional standards are perhaps less uniform, less well understood and less rigidly defined. Nonetheless the standards of conduct generally accepted by practitioners in the state of New York are not so indefinite that they cannot be determined by qualified persons They are part of the ethics of the profession and "what is generally called the 'ethics of the profession is but the consensus of expert opinion as to the necessity of such standards" Every member of the profession should be regarded as an expert for such purpose the court continued. There is a moral dereliction in failure by any member of a profession to apply in professional practice the standards which, by consensus of opinion in the profession, are necessary It seems to us, concluded the court that there is one course of conduct which in each and every profession is known as a matter of common knowledge to be improper and unprofessional That is conduct by which, after a professional man has been licensed by the state, he enters into a partnership in his professional work with a layman, by the terms of which he divides with the latter on a percentage basis, payments made by client or patient for professional services rendered. That is what the defendant did here. Accordingly the Court of Appeals reversed the ruling in favor of the defendant and confirmed the determination of the Board of Regents suspending the defendant's license—*Bell v Board of Regents of University of State of New York, 65 N E (2d) 184 (N Y, 1946)*

## AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1936 to date. Requests for issues of earlier date cannot be filled Requests should be accompanied with stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested) Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order Reprints as a rule are the property of authors and can be obtained for permanent possession only from them

Titles marked with an asterisk (*) are abstracted below

Vitamins and Hormones in Nutrition II. Endocrine Dyscrasia B F Sieve —p 80
Redundancy of Colon A. Galambos and Wilhelmina Mittelmann Galambos —p 87

**Physiologic Use of Water and Constipation**—McKenney says that some twenty years ago observations were begun in the clinics of the Oakland Health Center, later the Alameda County Institutions' Clinics, to determine the relationship of water to constipation. Patients having constipation were instructed to discontinue the use of enemas, laxatives and cathartics and to take at least two or more glasses of water, either cold or hot, along with their meals, regardless of other fluids taken such as tea, coffee or soup In obstinate cases they were advised to take an additional glass of water before breakfast. If there was no bowel movement for four or five days they were to take a single enema. All patients had to report at the clinic at least once a week Of a total of 477 patients, 345 were taking water with their meals but took no laxatives or cathartics and had no constipation Of these 345 patients 256 had been troubled with constipation and had taken various remedies for that condition They became well on the discontinuance of medication when they included a sufficient quantity of water with their meals

Human Encephalitis of Western Equine Type in Minnesota in 1941 Clinical and Epidemiologic Study of Serologically Positive Cases C. M Ecklund —p 171

**Neostibosan in Filariasis**—Culbertson and his associates administered neostibosan to 35 patients with filariasis due to Wuchereria bancrofti, of whom 20 were apparently entirely cured of the infection, as shown by their loss of all microfilariae during the period of observation (five to fifteen months) Ten others lost more than 80 per cent of their circulating microfilariae and appeared likely to lose the remainder within a few additional months In 5 of the 35 treated persons, administration of the drug failed to influence the infection noticeably Fifteen untreated controls were all still infected after observation from fourteen to seventeen months Neostibosan appears to act chiefly on the adult phase of the worm rather than on the embryos in the blood, although once the adults are killed the embryos gradually decline in number The immediate reactions of patients to neostibosan were slight, consisting chiefly of nausea and vomiting Usually patients acquired tolerance for the drug within the first several days of its administration In no case was it necessary to stop the drug because of toxicity In no patient were symptoms suggestive of elephantiasis induced by chemotherapy

**Puerperal Infection**—Maternal mortality caused by puerperal infection has not uniformly decreased as much as mortality due to other causes Douglas and Davis report bacteriologic data from the study of 1,000 patients which indicate that the great majority of infections occurring during the puerperium and postabortal period are endogenous in origin and caused for the most part by different groups of nonhemolytic streptococci Prophylaxis of infection is far more important than the treatment of the disease once established. Exogenous pyogenic infections may be largely eliminated by the rigid application of a comprehensive technic designed to prevent the inoculation of these organisms from the upper respiratory tract or other source into the genital tract of the patient. Some autogenous infections will develop irrespective of the application of the most rigorous aseptic routine The incidence of endogenous infections may be decreased by the control and restoration of blood loss, the limitation, better timing and more skilful employment of operative procedures, the judicious use of analgesic agents and other measures It is the opinion of the authors, based on experience but not proved conclusively, that sulfadiazine, given early during long labors and under certain other circumstances, will decrease the incidence of infection. Sulfadiazine or penicillin given early may be efficacious, while late in the course of disease they may be relatively ineffective

**Recurrent Trichomonas Vaginitis**—Allen and Butler say that zoologic studies establishing the separate identity of Trichomonas vaginalis, Trichomonas buccalis and Trichomonas hominis are not in accord with their clinical impression that attacks of diarrhea are frequently followed by the reappearance of trichomonads in the vagina Proctoscopy of 33 patients with treatment-resistant Trichomonas vaginitis, with cultures of the material thus obtained did not reveal any trichomonads in the bowel cultures Certain visual changes were observed in the rectal mucous membrane of a large percentage of these patients Six patients with T hominis intestinalis infestations had no vaginal trichomoniasis Immediate examination of surgical specimens removed from 28 patients with active Trichomonas vaginitis revealed no organisms above the cervix in direct smear or culture The treatment in this series of cases consisted in nightly insertion of a tablet of lactobacilli, a morning cleansing douche consisting of 1 drachm of lactic acid to 2 quarts of warm water followed by the instillation of one applicator full of jelly for daytime use. The lactic acid douche and the lactobacillus tablets have been replaced by ½ drachm of tincture of iodine in 2 quarts of warm water and topical applications of 1 per cent aqueous solution of gentian violet for the treatment of moniliasis

Jelly has been more effective for yeast infections than for trichomoniasis Sixty-two of 166 patients were cured by the use of jelly and douches alone Treatment throughout the menstrual period is essential for cure The addition of lactobacillus tablets will increase the permanent cures If reinfection occurs following gradually decreasing therapy, a search is begun for secondary foci of infection Catheterization of the bladder is done and is repeated several times If trichomonads are found or petechial bullous edema of the urethra or trigone is present, the bladder and urethra are treated biweekly with instillations of 5 per cent mild protein silver or 5 per cent sodium sulfathiazole The authors have occasionally added sulfathiazole by mouth in 30 grain (2 Gm) doses in an attempt to reduce the cocci accompanying trichomonas infestation of the urinary tract. If the investigation of the urinary tract was negative, the male partner was examined and motile trichomonads were found occasionally in the prostatic fluid The authors feel that T vaginalis is one of the most important etiologic factors in chronic prostatitis Some of the most resistant cases of trichomonas vaginitis were cured after the husbands had received adequate treatment

*Repeated Sympathetic Blocks Their Limitation and Value F L Faust —p 161
Pressor Activity and Stability of Different Mixtures of Ephedrine and Pituitary (Posterior Lobe) Extract K I Melville —p 176
*New Lethal Dose of Curare with Observations on Pathology Produced by Large Doses F Cole —p 190

**Intravenous Procaine for Arrhythmias During Anesthesia**—Burstein injected procaine intravenously in doses of 30 to 70 mg as a single dose injected into 14 anesthetized patients with acute arrhythmias during intrathoracic operations No untoward effects on the nervous system, respiration or circulation were observed. The dysrhythmias always improved often dramatically Three case reports, 1 with electrocardiographic tracings are presented The authors think that general anesthesia probably affords specific protection against the stimulating action of procaine on the central nervous system

**Repeated Sympathetic Blocks**—Faust reviews observations on 40 patients in whom 225 sympathetic blocks were made This group included patients with arteriosclerosis, a diabetic patient with trophic ulcers and neuritis and patients with thromboangiitis obliterans, acute or chronic thrombophlebitis, postphlebitic edema posttraumatic dystrophies epididymitis, chronic fungous infection with lymphedema chronic leg ulcers and sympatheticalgia. The hypothesis which guided the selection of patients was that in some cases of peripheral vascular disturbances there is also an element of abnormal vasoconstriction and/or vasodilatation which aggravates the circulatory deficiency Patients with acute thrombophlebitis, epididymitis and chronic leg ulcers showed circulatory improvement and relief of pain after each block The patients with arteriosclerosis, thromboangiitis obliterans and diabetes showed improvement, which was most noticeable when the blocks were given more frequently These are the patients who should do well after sympathectomy In the cases of postphlebitic edema and posttraumatic dystrophies the improvement after repeated blocks was encouraging The treatment produced improvement in 37 and failed in 3 cases

**New Lethal Dose of Curare Changes Produced by Large Doses**—Cole found that the anoxic lethal dose of Intocostrin in the dog is 0 065 cc, or 1/15 cc per pound of body weight. The anoxic lethal dose was not affected by cyclopropane-oxygen anesthesia A cumulative effect of curare was indicated by the death of 1 dog following the administration of what appeared later to be a sublethal dose The use of curare on succeeding days may be associated with a heightened effect of the drug An unidentified anticurare effect was encountered with a technic including tracheal intubation, cyclopropane-oxygen anesthesia, pentothal induction and the administration of the curare with saline solution through rubber tubing As evidenced by the deaths of 2 dogs, the animal is in a dangerous condition on emergence from deep curarization There is a nonanoxic lethal dose of curare Dogs can make complete recoveries, with artificial respiration, after receiving five times the anoxic lethal dose of curare, or 0 33 cc of Intocostrin per pound of body weight. The lethal dose of Intocostrin in dogs in the presence of continuous artificial respiration, is about twenty times the anoxic lethal dose, or 1⅓ cc per pound Complete recovery was made in one experiment following the administration of 1 cc. of Intocostrin per pound (fifteen times the anoxic lethal dose), artificial respiration was maintained for eighteen hours A temporary cyanosis was present following the administration of large doses of curare in the presence of proper artificial respiration Slowing of the pulse rate occurred whenever artificial respiration was stopped Bronchiolar or intercostal spasm is suggested immediately following the injection of large doses of curare by the greater amount of force required to raise the chest wall during artificial respiration No brain damage could be found (other than that due to anoxia) attributable to large doses of curare Bloody diarrhea occurred with large doses, and necropsy revealed mucosal hemorrhages throughout the intestinal tract There may be a relative contraindication to large doses of curare when there is disease of the intestinal tract Neostigmine does not appear to be a perfect neutralizing agent for large doses of curare The safest method of terminating the effects of a large dose is continuous artificial respiration until recovery

**Penicillin Treatment of Empyema**—Brown and his co-workers report 24 cases of empyema that were treated with penicillin at the Boston City Hospital and analyze 237 additional cases collected from the literature The general condition of patients with empyema improved greatly after treatment with penicillin and aspirations was started Those with putrid empyema were probably much better operative risks as a result of preparation with this form of therapy In the favorable cases, sterilization of the empyema fluid was usually accomplished and the volume which could be aspirated diminished appreciably after three intrapleural instillations or less The changes in the fluid following therapy, however, were not uniform and could not always be relied on as a guide for further therapy or as an indication for operation The foul odor of the putrid empyema cleared promptly after penicillin therapy was started In cases of empyema that were cured by aspirations and penicillin alone, the hospital course and convalescence were considerably shorter than in those in which operative drainage was employed In evaluating the cases reported in the literature the authors stress that it should be borne in mind that some of them were treated when the supply of penicillin was limited and it was of poorer quality than the products now available.

**Sensitivity of Diphtheria to Penicillin.**—Paull and his associates say that in August 1944 there was a sudden rise in the number of admissions of diphtheria cases to Letterman General Hospital from ships' hospitals and U S Army transports Since the use of diphtheria antitoxin in appropriate doses, administered early, was giving such highly satisfactory results in control of the clinical, symptomatic diphtheria, this method of treatment was continued during the stage of subjective illness In an attempt to reduce the duration of the carrier

state, however, the use of penicillin was considered A carrier was regarded to be a person who ten days after onset of illness continued to have positive nasopharyngeal smears and cultures A penicillin solution of 2 000 units per cubic centimeter of 10 per cent glycerin in isotonic solution of sodium chloride was adopted This solution was nebulized by an ear, nose and throat unit, using air as a source of pressure in such an amount as would in fifteen minutes nebulize 2 5 cc of the penicillin solution or 5 000 units of penicillin sodium The first series of virulent diphtheria bacillus carriers treated with nebulized penicillin received four fifteen minute treatments daily The results indicated that penicillin so used was of no benefit in reducing the interval of carrier state Orally inhaled and nasally exhaled nebulized penicillin of the same concentration, using 100 per cent oxygen instead of air as the nebulizing gas, likewise failed to reduce the duration of carrier state Nebulization of penicillin sodium 50,000 units per cubic centimeter into the nasal chamber was found nonirritating In vitro tests indicate that some strains of diphtheria are penicillin sensitive, whereas others are penicillin tolerant Forty-one of 64 cultures taken were penicillin sensitive

**Therapy in Cirrhosis of Liver**—Morrison deals with the results obtained from using various therapeutic combinations in the treatment of cirrhosis of the liver, or chronic hepatitis, in a series of 62 patients studied from 1938 to 1945 The series was divided into three groups each treated for two years over an eight year period. One group of 23 patients was treated only by such methods as were in use in 1938, that is, by paracentesis, diuresis, high carbohydrate diet and palliative therapy, this group contained 11 cases without ascites and 12 cases with ascites and was called the "untreated" control group A second group of 19 cases was treated by a modified "Patek" regimen consisting of a nutritious high protein, moderate carbohydrate, low fat diet, liver extract injections and vitamin B complex therapy This group contained 9 patients without ascites and 10 patients with ascites A third group of 20 patients was treated intensively with a combined therapy which consisted of a maximum protein (three meat servings daily plus skim milk), high carbohydrate low fat diet, daily injections of 5 cc of a "whole" liver extract, highly potent injections of vitamin B complex, daily oral vitamin B complex and multiple (total) vitamin capsules orally, together with 2 Gm each of methionine and choline daily This consisted of 11 patients without ascites and 9 with ascites Treatment with the intensive combined method resulted in reducing the mortality rate in the compensated group (without ascites) over a two year period of time to 0 (1943 45) as compared with 27 per cent mortality in the control group (1938-40) The intensive combined therapy in the group with ascites reduced the mortality rate from 75 per cent in the control group (1938-40) to 11 per cent in the treated group (1943-45) Treatment with the intensive combined therapy resulted in a sharp reduction in the length of the disability period from 82 per cent (1938-40) to 28 per cent (1943-45) in the groups without ascites and from 83 per cent (1938-40) to 66 per cent (1943-45) in the groups with ascites The intensive combined method of therapy resulted in a remission of all signs and symptoms in 64 per cent of cases of the group without ascites, as compared with remissions in only 10 per cent of cases in the control group, in the group with ascites remission occurred in 34 per cent of cases as compared with none in the corresponding control group

**Tympanosympathectomy for Tinnitus Aurium**—Lempert suggests that tinnitus aurium in many cases may be due to a tonus impulse transmitted to the inner ear by diseased sympathetic ganglion cells of the tympanic plexus Based on this new theory, tympanosympathectomy is recommended for the relief of tinnitus aurium In this operation the outer membranous third of the external auditory canal is widened to permit the introduction of the widest possible ear speculum, through which the tympanic cavity will be made readily accessible to surgical intervention Then the lower half of the annulus fibrosus of the tympanic membrance is disengaged from the corresponding portion of the sulcus tympanicus, and the disengaged lower half of the tympanic membrane is everted in order to expose to view the tympanic plexus After the tympanic plexus has been excised, the disengaged portion of the annulus fibrosus of the tympanic membrane is reinserted into its normal position within the sulcus tympanicus Of 15 patients on whom tympanosympathectomy was performed, 10 are now completely free from tinnitus Patients submitted to this surgical treatment should be those who complain of severe, continuous and persistent tinnitus of at least one year's duration

**Healed Dissecting Aneurysm of Aorta with Signs of Aortic Insufficiency**—A man aged 68, who had presented symptoms that led to the provisional diagnosis of rheumatic aortic insufficiency complete heart block and possible digitalis intoxication, died and a postmortem revealed a transverse split in the aorta 2 cm wide and 2 deep 0 8 cm above the aortic valve ring The split involved the intima, and this layer of the aorta formed a valvelike *semilunar* flap which projected into the lumen of the vessel The mechanism of regurgitation was caused by the lip of the aneurysm interfering with closure

of the aortic valves The blood column in the aorta following systole would easily project the lip of the sac into the lumen of the valve ring It is surprising that the aorta showed no degenerative or inflammatory lesions other than the sac It is possible that dynamic aortic dilatation may have been a factor in addition to the mechanical interference with valve function The onset of the intimal tear may have occurred five years prior to the present illness at which time the patient was seized with severe chest pain while chopping wood Durham stresses that this etiologic possibility should be considered in aortic insufficiency of nonsyphilitic and nonrheumatic origin

**Protein Requirements of Adults**—Hegsted and his associates studied the nitrogen balance in 26 adults who were fed diets low in protein and devoid of animal protein and investigated the effect of replacing part of the protein in the diet by meat, soy flour wheat germ and white bread. As a result they consider it most unlikely that protein deficiency will develop in apparently healthy adults on a diet in which cereals and vegetables supply adequate calories The National Research Council's daily recommended allowance of 70 Gm of protein for an adult weighing 70 Kg is most generous and could if necessary, be reduced to 50 Gm and still provide approximately 30 per cent margin above requirement. These experimental data apply only to adults in good health and do not consider protein requirements in growth, pregnancy lactation or disease

**Penicillin in Bacterial Endocarditis**—Glaser and his associates present the results of penicillin treatment of 28 patients with bacterial endocarditis All patients with adequate clinical and laboratory evidence of bacterial endocarditis were included regardless of the patient's condition at the time of admission to the hospital. Intermittent and continuous methods were used either intravenously or intramuscularly on various occasions The usual procedure was the intramuscular injection of 40 000 units every two hours day and night The use of a continuous intramuscular drip was abandoned because of reactions Twenty-two of the patients had streptococcic and 6 had staphylococcic infections Of the 22, 13 are living and well, 1 is living but the infection has not been arrested and 8 have died Five of these 8 fatalities occurred before the completion of the penicillin therapy, and of the 3 others 2 were due to congestive heart failure and in the third the organism was resistant to penicillin Resistance to penicillin was observed also in the patient who survived without arrest of infection In the 6 cases of staphylococcic endocarditis results were excellent Only 1 of these patients died, and this death was due to rupture of a brain abscess The authors emphasize the importance of prompt intensive and prolonged chemotherapy Relapse occurred in 2 patients after completion of a first course, but both patients responded to a prolonged second course

**Streptomycin, Sulfadiazine and Sulfapyrazine in Experimental Plague**—Wayson and McMahon inoculated 334 white mice with plague. One half of these were treated in groups with different amounts and varying dosage of either streptomycin, sulfadiazine or sulfapyrazine The other half were used as controls From 16 to 18 animals survived among each lot of from 18 to 20, while all the corresponding controls died with plague. Forty-eight guinea pigs were likewise inoculated, and half were treated with streptomycin in two groups after clinical evidence of infection had developed All survived, but 8 had residual buboes at necropsy Twenty-three controls died with plague One hundred and six guinea pigs were infected through flea transmission After the disease was evident clinically, 15 were treated with streptomycin and 14 survived, 15 received sulfadiazine and 14 survived, 10 received both these drugs and all survived 16 received sulfapyrazine and 10 survived Six among all the survivors had residual buboes at necropsy Three survived among 50 controls divided among the four lots treated Clinical recurrences appeared frequently under the treatment schedules used with streptomycin and sulfapyrazine but not with that of sulfadiazine

**Antihistamine Properties of Benadryl**—Loew and his associates conducted experiments to determine whether Benadryl, β-dimethylaminoethyl benzhydryl ether hydrochloride, antagonizes diverse actions of histamine on several tissues, viz stimulation of secretory cells relaxation of vascular smooth muscle and contraction of intestinal smooth muscle It was deemed important to determine whether Benadryl antagonizes histamine in a specific manner or whether the effects of other depressor and/or spasmogenic agents such as acetylcholine and barium are altered 1 A dilution of 1 50,000 000 proved effective in antagonizing the spasmogenic effects of histamine

on intestinal muscle, whereas much larger doses were required to antagonize the effects of acetylcholine and barium Benadryl possesses a degree of specificity against histamine which approaches the specificity of atropine against acetylcholine In view of weak antagonism of barium, the term antihistamine compound describes Benadryl more specifically than the use of the generic term musculotropic antispasmodic. 2 Secretion from denervated gastric pouches in dogs following stimulation with histamine was reduced approximately 40 per cent by pretreatment with Benadryl Evidence of inconsistency in results and lack of a pronounced inhibitory effect reduces the probability that a direct antagonism of the secretagogue action of histamine was involved 3 Depressor effects of small doses of histamine and acetylcholine were decreased by intravenous administration of Benadryl in dogs The possibility exists, therefore, that the relaxing effect of histamine on vascular smooth muscle was antagonized, as well as the contracting effect as demonstrated on intestinal muscle 4 Adequate doses of Benadryl augmented the pressor response to epinephrine There was no evidence of epinephrine reversal, which has been demonstrated with several other synthetic drugs which possess some degree of antihistamine action

**Dangers of Modern Insulin Syringes**—Collens and his associates point out that the original introduction of a variety of insulin concentrations necessitated the construction of hypodermic syringes with different calibrations corresponding to these various concentrations Apparently, in an attempt at economy, syringes with double graduations were manufactured The dual calibrations confuse the majority of diabetic patients and present a serious obstacle to the successful administration of the dose of insulin planned by the physician. This problem has been further complicated by the introduction of modified forms of insulin, such as protamine zinc insulin, zinc insulin crystals and globin insulin The introduction of a new technic for administering insulin mixtures has still further aggravated the problem The authors make recommendations for the manufacture of syringes with simplified graduations to eliminate the possibility of error in dosage

**Sublingual Administration of Penicillin.**—Hanan directs attention to the availability of the sublingual space for quick absorption into the blood stream of penicillin sodium in solution by way of the ranine veins under the tongue. He has been using this area to promote a rapid blood level of penicillin when oral medication was indicated Systemic absorption from the sublingual space nearly equals that from a subcutaneous injection The basic formula is 100,000 units of penicillin sodium, 5 cc. of isotonic solution of sodium chloride and one drop of spirit of peppermint Ten drops are placed under the tongue every hour or two This gives forty doses of 10,000 units each Results by this route have been prompt, uncomplicated and curative

**Chronic Ulcerative Esophageal Varices** —Steiner presents several cases of chronic ulcerative esophageal varices and describes the radiologic signs with particular regard to the mucosal relief both in the case of an actual crater and in the predominantly inflammatory form. As in other parts of the alimentary tract a sudden break in the mucosal pattern does *not necessarily indicate neoplastic infiltration* Narrowing of the lumen may be due to mucosal swelling without spasm or stenosis of the muscular coat Dilatation may result from hypotonicity alone. Absence of direct ulcer signs should not deter the radiologist from diagnosing chronic esophagitis, provided the alteration in the mucosal relief is constant and can be differentiated from early neoplasm.

**Graphite Pneumonoconiosis with Cavitation** —Dunner and Bagnall describe the first case of a lung cavity due to necrosis in a worker aged 64 who had been working with graphite for seventeen years In 1939 he was pronounced tuberculous and sent to a sanatorium His sputum was always free from tubercle bacilli After discharge he did not return to work with graphite but was able to do light work for six years In 1944, when first seen by the authors, radiologic aspects of his chest were unchanged when compared with those of films taken in and since 1939, and showed massive opacity in the right upper zone, similar, but fainter opacity in the left upper zone, and a rounded opacity the size of a golf ball superimposed on the lower part of the left root shadow In April 1945 he suddenly brought up large amounts of black material Samples of the undried sputum contained about 0 07 per cent of carbon, the size of the majority of the particles being 5 microns or less, with only a few over 10 microns No silica was detected

Hemolytic Streptococci in Puerperal Sepsis. J Dick —p 134

**Postprandial Variation in Hemoglobin** —Branwood shows that the percentage of hemoglobin in the peripheral blood is not constant throughout the day There is usually a postprandial fall in hemoglobin of the order of 5 to 10 per cent This fall is in proportion to the size of the meal—the larger the meal the greater the fall There is also presumably, a fall in the number of erythrocytes at this time. It will be obvious that when periodic hemoglobin values are required they should not be estimated within three hours following a large meal or should be estimated at the same time of day This decrease in hemoglobin is probably due to a redistribution of the cells from the periphery to the abdominal viscera and possibly also to slight changes in blood volume This fall in hemoglobin can be prevented by exercise or by the administration of epinephrine Cases of hypertension and hyperthyroidism do not share this postprandial decrease in hemoglobin

**Copper Sulfate Method in Routine Hematologic Examinations** —O Connor suggests that the copper sulfate method accompanied with centrifugalization of blood in a hematocrit tube is a satisfactory approach to a hematologic study of blood Unless there is some otherwise special indication, bloods submitted to and found normal by this method need not be further examined. The method immediately draws attention to a pathologic blood and, supplemented by a calculation of the specific gravity of the cells, may help to distinguish anemias classified as hypochromic. With further study the method may distinguish hyperchromic anemias and possibly normochromic, normocytic anemias and mixed anemias

**Healing of Thermal Burns** —Cameron and his associates produced thermal burns in anesthetized goats by immersing the right forelimb for two and one-half minutes in water kept at a steady temperature of 86 C The area of burning involved approximately 5 per cent of the total body surface. Quick setting cellulose and plaster of paris bandages were closely wrapped around the burnt limb within a few minutes of burning A layer of dry sterile gauze separated the plaster from the skin The bandages were kept on for thirty days In a *second series pressure treatment* was initiated at once but the plaster bandage was removed at varying intervals after burning In a third series pressure treatment was commenced two or four hours after burning and maintained for nineteen days In a fourth series goats with standard burns were treated with local applications of penicillin cream and an ointment containing sulfathiazole zinc oxide and amyl salicylate protected with sterile gauze but no pressure bandage. The prompt application of pressure bandages to thermal burns of the extremities of goats accelerated the rate of healing and greatly reduced the mean healing time. Pressure interferes with effusion of plasma and the formation of fibrin at the burn site. It reduced the severity of edema decreased the amount of reparative tissue and probably lessened the chance of local infection. Pressure should be applied as soon as possible after burning to get the best results A delay of four hours seemed to be the limit for beneficial effects There is no need to maintain pressure application for much longer than a week, for there was little difference in mean healing times for standard burns treated with pressure for nine, sixteen or thirty days Removal of pressure

bandages during a critical phase lasting for several days after burning was followed by severe edema of the burned area and delay in healing Healing of burns treated by the local application of penicillin cream or the ointment was less favorable

Toxic Infectious Epidemic Syndrome in Newborn M Lust and P Nelis —p 173
Chrysotherapy for Still's Disease. B Schlesinger —p 185

**Toxic Infectious Epidemic Syndrome of Newborn.**—An epidemic manifested by signs of intoxication associated with dehydration and diarrhea has recently been raging in parts of Belgium The newborn and babies several weeks old were affected particularly The temperature of the patients varied from 99 to 99 4 F Hypothermia was recorded in a considerable number of cases Death occurred within thirty-six to forty-eight hours but also after a prolonged course of from five to seven or even more days The mortality rate varied from 40 to 50 per cent, in some cities it reached 60 and even 100 per cent. Postmortems did not reveal any lesions or signs of irritation of the alimentary canal The etiology and the pathogenesis of this disease are not known, but parenteral infection seems likely, although the alimentary canal cannot be excluded

Neurosurgical Treatment of Dyskinesia (Choreoathetoid Movements Dystonia Tremor) M David and H Hecaen —p 209
Hertwig Magendie Phenomenon P Desvignes —p 220
Study of Results of Oscillometry A. H Israel and H Rendu —p 222

**Neurosurgical Treatment of Dyskinesia.**—David and Hecaen report the occurrence of torsion spasm in the right arm associated with spasmodic torticollis, tremor of the arm and hand and choreoathetoid movements of hemiballism type in a man aged 40 Conservative treatment was ineffective. Neurosurgical treatment consisted in resection of areas 4 and 6 of the cortex, followed by electrocoagulation. All the involuntary movements disappeared almost immediately after the cortical operation and did not recur for five weeks of electrocoagulation. Then the torsion spasm and the tremor reappeared but the choreoathetoid movements and the spasmodic torticollis did not recur within ten months after the intervention Although 1 case is not enough to form a basis for drawing definite conclusions the authors emphasize that treatment for tremor of Parkinson's type must be different from that for choreoathetosis

*Acute Diabetes Mellitus of Infectious Origin in Children Its Rapidly Regressive Course. J Marie P Seringe H Rouèche and P Maurice. —p 338

**Diabetes Mellitus of Infectious Origin in Children.**—Marie and his associates report acute diabetes mellitus in a girl aged 10 years and a boy aged 11 In both cases the history did not reveal any heredofamilial diabetes Both children were in perfect health until the girl had scarlet fever and the boy infectious jaundice In both cases polydipsia and polyuria appeared suddenly in the course of the infectious disease. In the girl, acidosis and a precomatose condition developed on the forty fifth day of the scarlet fever This strongly suggests that the diabetes did not precede the scarlet fever, since a diabetic child with scarlet fever or measles will develop acidosis and coma during the first days of the infectious disease Symptoms of coma appeared after the temperature came to normal and after the rash had disappeared. The glycemia was reduced from 4 16 Gm to 1.25 Gm within twenty-two hours of the administration of insulin In both cases the carbohydrate tolerance improved rapidly, so that insulin treatment of the girl was discontinued after twenty-two days and of the boy after sixty-four days Both children were placed on a high carbohydrate diet, and glycosuria did not recur This rapid and complete reversibility of the glycoregulatory disturbance seems to be exceptional in acidosic diabetes of children. Acute infectious regressive diabetes mellitus may therefore be considered to be a variety of infantile diabetes

Chorea Caused by Injury of Superior Peduncle in Light of Experimental Research S Burgi —p 1036

**Cerebral Manifestations of Endangiitis Obliterans**—Krayenbühl reports 25 cases of cerebral manifestations of Winiwarter-Buerger's endangiitis obliterans In 3 of these the cerebral manifestations accompanied a more or less generalized endangiitis obliterans, while in 22 the endangiitis was restricted to the cerebral blood vessels Careful cardiovascular examination and cerebral arteriography offer considerable aid to the diagnosis of the rare cases of the first group Diagnosis proved more difficult in the second group The age at which the initial symptoms of the disease occurred varied from 11 to 58 years Signs of unilateral motor or sensory paralysis of various degree and extent in all the patients were revealed on examination or by the history Ocular symptoms were rare Temporary spasms of the vessels of the retina were not observed A drop in arterial blood pressure of the retina was demonstrated occasionally There were no symptoms of increased intracranial pressure. In 12 cases the complete occlusion or a more or less high degree of constriction of the internal carotid artery was demonstrated at the point where the common carotid artery gives off the internal carotid artery, this, therefore, is to be considered as the area of predilection of the vascular process In 4 cases the occlusion of the internal carotid artery occurred in the carotid siphon', this term is applied to the point where the internal carotid artery gives off the middle cerebral artery

**Esophageal Peptic Ulcer**—Diaz and Riera report 7 cases of peptic ulcer of the esophagus Statistically there is 1 case of esophageal peptic ulcer for every 30 cases of gastric ulcer Peptic ulcer of the esophagus almost always is located within the distal third of the esophagus slightly above the cardia or at the level of the diaphragmatic hiatus Probable etiologic factors include the digestive action of gastric juice, esophageal varices and conditions which lead to dysfunction of the cardia and favor backflow of gastric juice, such as pyloric stenosis diaphragmatic hernias, short esophagus or thoracic stomach Pain which at times is burning and which coincides

or follows deglutition, is the most frequent symptom Some patients have dysphagia, but in others it is absent Vomiting and particularly regurgitation are important symptoms Important roentgenologic and endoscopic findings include spasm, appearance of a defect, slow esophageal passage with persistence of barium in the ulcerated portion, stenosis with dilatation above, insufficiency of the cardia and dilatation of the distal third of the esophagus

*Laryngeal Diphtheria T Kahrs —p 2034

### Hygiea

Stricture of Pulmonary Artery Due to Shrinking Mediastinitis G Soderberg —p 2051

**Schick Test During Diphtheria Epidemic in Bergen** —The diphtheria epidemic which flared up in Bergen, a city of 105,000 late in 1941 apparently reached its peak in 1943-1944 In 1943, 519 cases were reported From September 1944 to February 1945 the Schick test was performed on 3,000 unvaccinated persons aged from 16 to 71, mostly from 21 to 50, mainly from the better social class The reaction was positive in 67 per cent, a remarkably high percentage in an epidemic of so long duration, of the 117 who had had diphtheria, 58 per cent were Schick positive In 120 additional persons vaccinated against diphtheria the test gave a positive reaction in 5 per cent.

**Diphtheria in First Year of Life** —In the 106 cases of diphtheria in infancy in the recent epidemics in Bergen and Throndheim there were 15 deaths (14 per cent), with 11 deaths in the 76 cases in infants under 6 months Bøe says that diphtheria in infants is often not recognized even in epidemic periods Nasal diphtheria is its most frequent form Long continued coryza is often the only symptom, till disturbances in nutrition occur and the infant becomes highly susceptible to other infections, especially bronchopneumonia Diphtheria in infants seems to tend more than in the older age groups to spread downward. Vaccination is without practical value, as so few infants form antibodies The efficacy of serum treatment was doubtful Possibly in epidemics the newborn might be protected by vaccination of the Schick positive mothers some time before delivery

**Laryngeal Diphtheria** —Kahrs says that the 140 cases of laryngeal diphtheria treated from 1941 to 1945 constituted 4 6 per cent of the diphtheria cases in Stavanger Hospital, 55 per cent of the patients were under 6 months and about 85 per cent were under 20 Therapy consisted in application of serum, steam and in 62 cases of tracheotomy Thirty-two patients (22 9 per cent) died, of those operated on, 23 died It is at times difficult to distinguish laryngeal diphtheria from acute laryngitis The onset of laryngeal diphtheria is slower than that of laryngitis, with a more gradually developing difficulty in respiration and often at the start slight symptoms of angina. The disease is as grave today as in the past.

**Phlebitis, Thrombosis and Embolism in Patients Out of Bed from Day after Operation** —Dahl-Iversen states that during the last three years patients after laparotomy without drainage, after operations on the external genitalia, perineum, anus, vagina and uterus, after operations on the head, neck, trunk and extremities, on the bladder and prostate and herniotomy have been allowed to be up from the day following the intervention In the 1,736 patients thus treated postoperative complications of phlebitis, thrombosis and embolism have been reduced from 3 5 per cent before the introduction of the procedure to 0 58 per cent. The incidence of recurrence after herniotomy has not been increased, follow-up of 110 patients two years after the operation showed recurrence in 3 instances (2 7 per cent)

**Cancer of Gallbladder** —According to Andersen there are two types of cancer of the gallbladder, one with a long standing history of gallbladder disease, the other with a brief history and symptomless course. The possibility of an early diagnosis is slight. Roentgen diagnosis succeeds only in exceptional cases The condition may be surmised when there is a constant dull pain under the right costal arch in a long standing gallbladder disturbance associated with increased sedimentation rate, weakness, loss of weight and late local signs in the abdomen The cancer soon spreads to the liver by invasion and metastasis There is little chance for effective therapy The prognosis is relatively favorable only in cases in which the cancer is an accidental finding in a gallbladder removed for other cause. In the literature only 7 cases free from recurrence after five years have been reported, Heller reports a case with recurrence after six years In from 80 to 90 per cent cancer of the gallbladder develops in a gallbladder with stones, and 5 to 10 per cent of all patients with gallstones are likely to die from cancer of the gallbladder Prophylaxis consists in early operation in patients with gallstones Microscopic examination of 80 cases of cancer of the gallbladder revealed 34 adenocarcinomas, 2 scirrhous cancers and 18 medullary cancers (Gröbl and Pohl)

# Book Notices

**The Chemistry of Anesthesia** By John Adriani M D Director, Department of Anesthesia Charity Hospital of Louisiana at New Orleans Fabrikoid Price $7 Pp 536 with 45 illustrations Springfield Ill Charles C Thomas 1940

Here is a definite milestone in the advancement of the recently recognized specialty of anesthesiology in American medicine The author's statements that chemistry plays a significant role in anesthesiology and that it is the most widely reflected fundamental science in medicine certainly are truisms One has but to glance at the three major parts of the text on inorganic chemistry related to anesthesia organic chemistry related to anesthesia and biochemistry related to anesthesia, to realize something of the scope of this fundamental science in this specialty As a corollary it reflects the importance of anesthesiology in the entire field of biology and medicine.

The book shows careful thought and planning It indicates months of work for in the first two divisions there is collected and presented in an interesting manner and a logical, orderly sequence the essential and basic physical and chemical information to which ready and frequent reference is desired This includes a clear explanation of the well known laws for behavior of gases and the 'why and how' of apparatus in which they are used The basic principles of the structure and behavior of organic compounds are very well presented. Drugs are classified and discussed by groups on the basis of their physiologic effects on the autonomic nervous system or by general action such as the analeptics local anesthetics or opium derivatives Only very pertinent information is included.

The effects which anesthetic agents can be expected to produce in alteration of normal physiologic function are briefly and concisely given in the third division of this useful book It includes a discussion of the chemical basis of the proposed mechanisms of narcosis The effects of anesthesia on composition of body fluids require three chapters, including in the first such topics as intracellular water, blood volume, interstitial fluid volume, the erythrocyte and hemoglobin The second chapter of this discussion is concerned with effects of anesthetic agents on electrolytes, total base, the common cations and anions the halogens, sulfates lactates and acid-base balance. The latter topic is particularly well discussed and is followed by the practical topic of convulsions in anesthesia and the acid base aspects of such an accident.

The third and concluding chapter, on body fluids, is concerned with the organic constituents, nonprotein nitrogen urea, uric acid amino acids, creatine and creatinine, ammonia, guanidine bases and plasma proteins It includes also the changes in nonprotein nitrogen during anesthesia, the clotting of blood, carbohydrates and cerebrospinal fluid. Chapters on anesthetic effects on the liver, on formation and composition of the urine, on lipoid and nervous tissues and on enzymes, vitamins and hormones also are adequately and concisely presented.

Every qualified medical anesthetist would profit by frequent reference to this book. It is indicative of the broad basic principles on which the specialty of anesthesiology is founded.

**Hypoglycemies spontanées Le traitement chirurgical de l hyperinsulinisme** Par P Mallet Guy professeur agrégé à la Faculté de médecine de Lyon et P Maillet prosecteur à la Faculté de médecine de Lyon Préface du Pr H Mondor Paper Price 55 francs. Pp 102 with 17 illustrations. Paris Masson & Cie 1944.

This small monograph deals with all the clinical phases of hyperinsulinism, emphasizing islet cell tumors An interesting point brought out in the text is that hypoglycemia may in rare instances be associated with chronic fibrous pancreatitis In this country at present it has little scientific value, since it is based on the American literature up to 1938 and the French literature up to 1943 This is no fault of the authors, who are eminent men in surgery and medicine respectively in France but is due to the isolation of the conquered countries from the rest of the world during the German occupation The book is written in the classic French style an example of logic clarity and conciseness The American surgeon who might happen to read the volume will be interested to note that here is a European treatise dealing with a field developed primarily in this country and which acknowledges American leadership

**Medicine in Industry** By Bernhard J Stern Ph D Visiting Professor of Sociology Yale University New Haven Connecticut Studies of the New York Academy of Medicine Committee on Medicine and the Changing Order Cloth Price $1 50 Pp 209 New York Commonwealth Fund London Oxford University Press 1946

This is one of a series of monographs published under the auspices of the Committee on Medicine and the Changing Order of the New York Academy of Medicine The foreword states that the committee was established in 1942 because of the conviction that the medical profession is confronted with problems which require thorough study and that the academy had both the opportunity and the responsibility to contribute to the effective solution of these problems The instructions of the council to the committee were to review the nature, quality and direction of the economic and social changes that are taking place now and that are to be anticipated in the immediate future, to define in particular how these changes are likely to affect medicine in its various segments and to determine how the best elements in the science and art of medicine and in its service to the public may be preserved, embodied and extended in whatever new social patterns may ultimately appear To date there are four books in the series This is the second which has been written by Dr Stern the other being American Medical Practice in the Perspectives of a Century The monograph presents an extended review of the scientific developments in industrial medicine social and legislative backgrounds, a discussion of the extent of industrial disabilities and of the handicapped worker in industry, a review of the present status of preventive services and of medical care and health insurance plans in industry and a chapter on the industrial physician The book contains a wealth of factual material and is well written. It develops the well known thesis that our social organization has not kept pace with the development of medical science. It is apparent that the author considers the centralization of control and regulation of working and living conditions under federal jurisdiction an important means of improving standards in the field of industrial health One is left with a feeling of regret that an overemphasis of the class struggle detracts greatly from what might well be a valuable objective contribution

**In vitro Studien zur lokalen Sulfanilamid Therapie** Von Julius Hirsch Aus dem Hygiene Institut der Universität Istanbul Paper Pp 30 with 6 illustrations Istanbul Kenan Matbaasi 1946

The experiments reported in this paper were carried out by Hirsch of the Hygiene Institute of the University of Istanbul in collaboration with H Özerengin The authors stress that local administration of the sulfonamides gives a concentration at least one hundred times greater than the concentration in the blood after oral or parenteral administration To gain insight into the mode of action of the sulfonamides during local administration the authors investigated nine sulfonamide preparations in 0 01 molar concentration against sixteen different cocci and bacteria in a buffered ($p_H$ 7 0) nutrient solution of peptone and yeast extract. The presence of products of protein decomposition and extracts of yeast cells produces similar biochemical conditions for the activity of sulfonamides as exist frequently in local infections as the result of presence of tissue detritus or pus The authors discuss the phenomenon of selective activity of sulfonamide compounds and stress certain practical applications of the experimental results for the local therapy They believe that in view of the frequency of mixed infections compound preparations should be produced which contain substances of varying selectivity Such polyvalent preparations could find general application and would dispense with the necessity of bacteriologic control in daily practice

**Nomenclatura y clasificación de los tumores del sistema nervioso** Por P del Rio Hortega Paper Pp 63 with 67 illustrations Buenos Aires Lopez & Etchegoyen S R L. 1945

This is a brief presentation in a South American publication of the views of the famous late Spanish neurohistologist and neuropathologist on the classification of tumors of the central peripheral and sympathetic nervous systems Each tumor is briefly discussed and adequately illustrated, but details of the clinical characteristics and of the gross and microscopic appearance of the tumors are not presented. The index is brief, and there are no references to the literature

# Queries and Minor Notes

THE ANSWERS HERE PUBLISHED HAVE BEEN PREPARED BY COMPETENT AUTHORITIES THEY DO NOT HOWEVER, REPRESENT THE OPINIONS OF ANY OFFICIAL BODIES UNLESS SPECIFICALLY STATED IN THE REPLY ANONYMOUS COMMUNICATIONS AND QUERIES ON POSTAL CARDS WILL NOT BE NOTICED EVERY LETTER MUST CONTAIN THE WRITER'S NAME AND ADDRESS BUT THESE WILL BE OMITTED ON REQUEST

## CARBONATED BEVERAGES FOR YOUNG CHILDREN

*To the Editor* —Is there any contraindication in giving carbonated beverages particularly those containing caffeine (the cola drinks) to children from age 1 upward?

M C A U S

ANSWER —This question is considered at some length in a report of the Council on Foods and Nutrition under the title of Some Nutritional Aspects of Sugar Candy and Sweetened Carbonated Beverages published in THE JOURNAL, Nov 7, 1942, page 763 The following comments were taken from the Council's report

The use of caffeine by children is not considered wise but especially undesirable is the fact that the use of sweetened drinks displaces the use of other foods Sweetened drinks tend to replace that important part of the child's diet milk

With older children it is obvious that a school lunch suffers gross deterioration when the beverage chosen in place of milk is a solution of sugar in flavored water It is also generally conceded that excessive sugar eating between meals or sugar eaten in smaller amounts within an hour of the regular meal time impairs the appetite for foods at meals

Many investigators have attributed harmful effects to the teeth of the excessive use of highly refined sugars The indiscriminate and uncontrolled supply of poor food for consumption between meals cannot be condoned with impunity

## ADMINISTRATION OF COLD PLASMA

*To the Editor* —Is there any physiologic motive justifying the administration of ice cold plasma to patients under anesthesia? I noticed two immediately fatal reactions in which the patients never regained consciousness and although the *post hoc* is not necessarily the *propter hoc* I am inclined to question the value of the procedure I should also like to know the effect of ice cold liquids on the intima of the vein chosen for transfusion Has any pathologic work been done on the subject?

M D Ontario

ANSWER —The physiologic motive justifying the administration of ice cold plasma to patients under anesthesia is obscure Unless a special apparatus is used or the material is given at high speed, the plasma warms up considerably before reaching the patient's blood stream On the other hand the administration of plasma or any other parenteral fluid without warming directly from the refrigerator does not cause any reaction attributable to the low temperature itself There is far more danger in improper heating of plasma and other parenteral fluids than there is in using them directly from the refrigerator

Plasma preserved at refrigerator temperature flocculates heavily It should be carefully filtered immediately before transfusion or while it is administered Failure to do so might cause severe, possibly fatal reactions Maintenance of the plasma in the frozen or dried state practically eliminates flocculation

## SUDDEN DEATH

*To the Editor* —What causes sudden death of a middle aged man apparently well after sudden exertion? Also what is the cause of sudden death of adults three or four days after operation following mild exertion such as getting out of bed?

M D New York

ANSWER —Probably the most common cause of sudden death in middle adult life of a man apparently well and following exertion is some form of cardiac disorder This may be basically an unrecognized valvular disease or atherosclerosis of the coronary arteries, with sudden occlusion and cardiac infarction

Sudden death of adults several days following an operation with or without exertion is often due to embolism caused by dislodgment of thrombi formed in the veins of the trunk or extremities and carried as emboli by the venous blood into the right side of the heart the pulmonary artery or its branches Cardiac conditions as mentioned in the preceding paragraph could be causal

While these represent highly probable causes of death under the conditions mentioned one should not presume that the cause of a specific death can be established on the basis of such possibility A complete postmortem examination is necessary

## ANOMALY OF THE NECK WITH COUGH

*To the Editor* —A girl aged 6 years has a cough which is hoarse in character occurs during the time she is awake and is sudden and short It is not productive and is not accompanied by fever or any other complaint laboratory finding except slight enlargement of the hilar glands The cough has persisted for six months The unusual finding is that on coughing or during speech a large soft swelling appears suprasternally apparently large air pocket Please advise regarding possible further efforts regarding diagnosis or treatment

Bernard Farfel M D Houston Texas

ANSWER —Thyroglossal cysts are among the most common anomalies found in the neck Complications that occur are spontaneous rupture and infection The cyst may be injected with methylene blue and the patient then observed to see if the material appears in the throat Another method is to aspirate the cyst and inject material opaque to x-rays If the latter procedure is carried out, the material should be reaspirated afterward

Treatment with sclerosing materials has been generally abandoned Radical extirpation is the procedure of choice and should be carried out in the operating room

## TOXICITY OF BARBITURATES

*To the Editor* —Recently articles have appeared in the daily press concerning the toxic effects of barbiturates when taken with alcoholic beverages mentioning a type of "jag" What is the lethal dose of barbiturates (single dose)? Is the lethal dose different for the various salts of barbituric acid? Is the lethal dose diminished if the barbiturate is taken with alcohol?

George R Moffitt M D Harrisburg Pa

ANSWER —Barbiturates are potent narcotics which in large doses depress the brain and the medullary centers The depression may be intermingled with euphoria, confusion and excitement analogous to the alcoholic "jag" Neurotic persons especially prone to develop such reactions All the commonly used barbiturates have similar actions but differ in potency and in speed of action and recovery Sollmann's Manual of Pharmacology tabulates the reported fatal doses of some barbiturates

| | Smallest Dose Reported as Fatal | Largest Dose Reported as Survived |
|---|---|---|
| Allonal | 30 tablets | 40 tablets |
| Amytal | 1.6 Gm (25 grains) | 7 Gm (108 grains) |
| Barbital | 2 Gm (30 grains) | 33 Gm (500 grains) |
| Phenobarbital | 1.7 Gm (26 grains) | 9 Gm (135 grains) |

The various salts of a given barbituric acid have practically the same toxicity as the acid itself

The toxicity of alcohol is additive and therefore would tend to lower the lethal dose However this difference would not be important unless an unusually large quantity of alcohol was consumed

## MIGRATORY PHLEBITIS BUERGER'S DISEASE AND PULMONARY EMBOLISM

*To the Editor* —It has been stated that 20 to 30 per cent of proved cases of thromboangiitis obliterans give a history of migratory phlebitis Is there any report of the percentage of cases of migratory phlebitis in young people which eventually develop into Buerger's disease? What is the frequency of pulmonary emboli in migratory phlebitis as compared with phlebothrombosis? Should femoral vein ligation be considered in every case with a history of several bouts of superficial phlebitis?

Saul Mackover Captain M C A U S

ANSWER —It is safe to assume that every case of migratory phlebitis in young men who do not have preexisting varicosities is an early form of Buerger's disease No statistics can be quoted as to the number of cases in which this disease in its full blown form later develops since migrating phlebitis responds readily to abstinence from tobacco, sufficient water and salt intake and sodium tetrathionate However, untreated or misdiagnosed cases invariably show the loss of one or several pulses in the upper or lower extremities if the period of observation is long enough

Migratory phlebitis does occasionally produce pulmonary emboli but is then usually associated with additional deep venous thromboses This occurs in more severe forms of the disease Femoral vein ligation would be indicated if the source of emboli could be localized to one or both of the lower extremities It should be recognized, however that migrating phlebitis varies greatly from the bland phlebothrombosis of the deep veins that the clotting mechanism is disturbed and that vascular sensitization may be present Thus some of the pulmonary symptoms [illegible] localized thromboses
